

Über dieses Buch

Dies ist ein digitales Exemplar eines Buches, das seit Generationen in den Regalen der Bibliotheken aufbewahrt wurde, bevor es von Google im Rahmen eines Projekts, mit dem die Bücher dieser Welt online verfügbar gemacht werden sollen, sorgfältig gescannt wurde.

Das Buch hat das Urheberrecht überdauert und kann nun öffentlich zugänglich gemacht werden. Ein öffentlich zugängliches Buch ist ein Buch, das niemals Urheberrechten unterlag oder bei dem die Schutzfrist des Urheberrechts abgelaufen ist. Ob ein Buch öffentlich zugänglich ist, kann von Land zu Land unterschiedlich sein. Öffentlich zugängliche Bücher sind unser Tor zur Vergangenheit und stellen ein geschichtliches, kulturelles und wissenschaftliches Vermögen dar, das häufig nur schwierig zu entdecken ist.

Gebrauchsspuren, Anmerkungen und andere Randbemerkungen, die im Originalband enthalten sind, finden sich auch in dieser Datei – eine Erinnerung an die lange Reise, die das Buch vom Verleger zu einer Bibliothek und weiter zu Ihnen hinter sich gebracht hat.

Nutzungsrichtlinien

Google ist stolz, mit Bibliotheken in partnerschaftlicher Zusammenarbeit öffentlich zugängliches Material zu digitalisieren und einer breiten Masse zugänglich zu machen. Öffentlich zugängliche Bücher gehören der Öffentlichkeit, und wir sind nur ihre Hüter. Nichtsdestotrotz ist diese Arbeit kostspielig. Um diese Ressource weiterhin zur Verfügung stellen zu können, haben wir Schritte unternommen, um den Missbrauch durch kommerzielle Parteien zu verhindern. Dazu gehören technische Einschränkungen für automatisierte Abfragen.

Wir bitten Sie um Einhaltung folgender Richtlinien:

+ *Nutzung der Dateien zu nichtkommerziellen Zwecken* Wir haben Google Buchsuche für Endanwender konzipiert und möchten, dass Sie diese Dateien nur für persönliche, nichtkommerzielle Zwecke verwenden.

+ *Keine automatisierten Abfragen* Senden Sie keine automatisierten Abfragen irgendwelcher Art an das Google-System. Wenn Sie Recherchen über maschinelle Übersetzung, optische Zeichenerkennung oder andere Bereiche durchführen, in denen der Zugang zu Text in großen Mengen nützlich ist, wenden Sie sich bitte an uns. Wir fördern die Nutzung des öffentlich zugänglichen Materials für diese Zwecke und können Ihnen unter Umständen helfen.

+ *Beibehaltung von Google-Markenelementen* Das "Wasserzeichen" von Google, das Sie in jeder Datei finden, ist wichtig zur Information über dieses Projekt und hilft den Anwendern weiteres Material über Google Buchsuche zu finden. Bitte entfernen Sie das Wasserzeichen nicht.

+ *Bewegen Sie sich innerhalb der Legalität* Unabhängig von Ihrem Verwendungszweck müssen Sie sich Ihrer Verantwortung bewusst sein, sicherzustellen, dass Ihre Nutzung legal ist. Gehen Sie nicht davon aus, dass ein Buch, das nach unserem Dafürhalten für Nutzer in den USA öffentlich zugänglich ist, auch für Nutzer in anderen Ländern öffentlich zugänglich ist. Ob ein Buch noch dem Urheberrecht unterliegt, ist von Land zu Land verschieden. Wir können keine Beratung leisten, ob eine bestimmte Nutzung eines bestimmten Buches gesetzlich zulässig ist. Gehen Sie nicht davon aus, dass das Erscheinen eines Buchs in Google Buchsuche bedeutet, dass es in jeder Form und überall auf der Welt verwendet werden kann. Eine Urheberrechtsverletzung kann schwerwiegende Folgen haben.

Über Google Buchsuche

Das Ziel von Google besteht darin, die weltweiten Informationen zu organisieren und allgemein nutzbar und zugänglich zu machen. Google Buchsuche hilft Lesern dabei, die Bücher dieser Welt zu entdecken, und unterstützt Autoren und Verleger dabei, neue Zielgruppen zu erreichen. Den gesamten Buchtext können Sie im Internet unter `http://books.google.com` durchsuchen.

CARRON

ARTISTIC FIREPLACES.

There are Carron Fireplaces to match every furnishing scheme—English or French, antique or modern, no matter how simple or how elaborate.

Carron Company have the finest, most artistic, and most extensive selection of Fireplace Furnishings in existence. These include some choice XVIIIth Century Designs, which are considered to be among the finest extant.

The artistic qualities of Carron goods have not been permitted to interfere with their efficiency.

Illustration shows one of Carron Company's XVIIIth Century Design Suites which would give striking distinction to a well-furnished drawing-room. Interior part is all brass, including dogs and feet. The Mantel and Overmantel can be supplied in Grained Oak or Walnut Enamel finish.

On view at the Company's various Showrooms.

Write for Catalogues.

CARRON COMPANY INCORPORATED BY ROYAL CHARTER 1773

Works: CARRON, Stirlingshire.

THE
ARCHITECT
AND CONTRACT REPORTER.
A JOURNAL OF ART, CIVIL ENGINEERING & BUILDING.

THE WEEK.

THE late Mr. ALEXANDER WILLIAM MILLS, who was head of the firm of Messrs. MILLS & MURGATROYD, architects, of Manchester, died in November last in his ninety-second year. He was a very successful architect, and was able to leave property of the gross value of 92,046*l.* Part of the money has been applied for professional and educational purposes. The Manchester Society of Architects will benefit to the extent of 8,000*l.*, of which at least 5,000*l.* is to be set aside to form a permanent source of income, the Royal Institute of British Architects to decide as to the investment and expenditure of this fund if the local council are unable to agree. Such part of his plate and household effects as his trustees shall select will also be given to the Society for furnishing a building with rooms for the use of members and students of the Society, or for ornamental or instructive purposes in any building under their control. A sum of 4,000*l.* is bequeathed to Owens College, Manchester, to form a permanent endowment for the College under the title of the Alexander Mills Endowment Fund, and to be applied (except in the purchase of land) as the trustees are by the charter empowered to apply such funds; 3,000*l.* to the Manchester Royal Infirmary, 3,000*l.* to the Manchester Grammar School, and 500*l.* each will go to several benevolent institutions, including the Architects' Benevolent Society. The testator had bequeathed 10,000*l.* to the mayor, aldermen and citizens of Manchester for an Alexander Mills Art Fund, the income from which was to have been applied in the purchase of works of art for the benefit of the people of Manchester, but this bequest was afterwards revoked.

MAIDSTONE is one of the oldest as well as the most prosperous of Kentish towns. Although it was not until the reign of King JOHN that a residence was found for the Archbishop of CANTERBURY, the manor was connected with the see from an earlier period. The house which WILLIAM DE CORNHILL made over to Archbishop LANGTON no longer exists, but it is possible the building known as "The Palace" stands on the site of it. In the middle of the fourteenth century a residence was commenced by Archbishop UFFORD, but it was not completed until the close of the fifteenth century. The existing building is of a later style, and the front is Elizabethan. There are outbuildings connected with the palace, and among others an ancient gatehouse which, it appears, is to be removed. It has found one advocate for its preservation in Mr. ALBERT GOODWIN, whose paintings of real and imaginary buildings are evidence of his competence to judge architectural works. In the course of a letter to a friend he writes:—"After long absence from my native town I was delighted with the new Mill Street, which opens up a prospect to the old church in (what was to me) a quite unexpected way. But my delight was marred by the information given to me that the picturesque old gatehouse was threatened with demolition. Why? I ask. What has it done? Where is it in the way? Does it not greatly add to the interest (pictorially and historically) of the almost unique group of buildings of which it forms a part? With those who have authority in these matters, I would plead for at least a reprieve. These old buildings are increasingly rare, and, unless the need is absolute, should surely be preserved." After such a testimony from an artist who, like WOOLLETT, the engraver, has added to the renown of Maidstone, the authorities will, it is to be hoped, endeavour to preserve the old structure.

JUDGES, as a rule, are not favourable to arbitration with laymen as substitutes. It is, therefore, more remarkable to have one of the Scottish "sheriffs" or a county court judge saying:—"This case would have been better and more economically disposed of by being referred to a man of skill. It is deplorable to think that a four days' proof should have been necessary." The circumstances of the case, however, warranted the remark. A builder entered into a contract in 1904 to erect a small dwelling-house, stable, &c., for 384*l.* There were also extras to the extent of 20*l.* 10*s.* 9*d.* On the other hand, deductions were claimed amounting to 20*l.* 10*s.* 3*d.* The sum of 300*l.* had been paid, so that the sum in dispute was only 84*l.* 0*s.* 6*d.*, after extras and deductions were reckoned. Yet so petty a case occupied the Court during four days. No doubt the Scottish weakness for litigation was satisfied, and the parties in the case and their descendants can talk of it with gratification. But it seems absurd that a judge should be compelled to listen to a mass of details which would not be necessary if an expert were trying the case. It may be taken for granted that whenever a litigant or litigants in a building case decline to accept arbitration, there is something in the affair which will not bear the scrutiny of an experienced architect.

THE carpenters and joiners and the master-builders of Sydney have submitted a case relating to the hours of working to the Arbitration Board, appointed under the Conciliation and Arbitration Boards Act, a measure which is of great advantage to the building and other trades. After careful consideration the board fixed the working hours from 7.30 A.M. to noon, and from 12.45 P.M. to 5 P.M. for each weekday, and from 7.30 A.M. to 11.45 A.M. on Saturdays. This makes a working week of forty-eight hours. The decision does not satisfy the carpenters and joiners. They desired to avoid working more than eight hours on five weekdays, and half a day on Saturday. The subject has been for a long time in dispute, for while some favour a working week of forty-eight hours, there are others who do not expect to be called on to work during the whole of Saturday. The Arbitration Board have, however, arrived at a reasonable conclusion, and there is a hope in the Colony that it will be accepted, at least temporarily.

TRURO CATHEDRAL.

See Illustration.

THERE never was a time when so much enthusiasm in regard of building was exhibited as during the Middle Ages. There are sufficient contemporary accounts to enable us to realise the crowds of men and animals taking part in the operations. The wealthy gave money and materials, farmers sometimes supplied bullocks to draw timber and stone to the site, craftsmen offered their labour gratuitously. In spite of such assistance the erection of cathedrals in England and abroad occupied many years. When additions had to be made the original style had become antiquated. A modern contractor would be likely to explain the phenomenon by saying that the organisation was defective and that the over-numerous men interfered with one another.

That theory becomes more plausible when we consider the history of Truro Cathedral. In 1878, *i.e.* two years after the formation of the see, JOHN LOUGHBOROUGH PEARSON was selected by the committee as the architect for the new building. The works were commenced in 1880, and in 1887 services were held in the choir. A comparison between Mr. PEARSON's original design and the building as it appears at present will suggest how much has been accomplished in a quarter of a century. There are economists who condemn the modern contract system, but Truro shows that work can be accomplished under it in the most expeditious manner.

The architect deserved to be entrusted with so important a work. He had rendered himself competent by constant study and practice. A native of Durham, he was in his sixty-first year when the great opportunity was offered him. He was articled in his fourteenth year, and he served as an assistant in HARDWICKE's office. When he was twenty-four he was architect for a church in Yorkshire, and he was known by his London works from 1848. Mr. PEARSON was not a mere head of an office for the production of designs. Nor did he make diplomacy serve for invention. In such churches as St. Peter's, Vauxhall, St. Augustine's, Kilburn, St. John's, Red Lion Square, and St. Stephen's, Bournemouth, we see a different treatment in each case, and we believe he never allowed an old design to serve even for a part of another building. He also restored churches, and it was inevitable that objections should be raised to his treatment. But he was conservative in disposition, and the manner in which he has worked in the parish church of St. Mary to form part of the cathedral is enough to suggest his caution and respect for whatever was ancient.

The qualities which Dr. BENSON, who was the first Bishop of Truro, found in the design were grace, religiousness and simplicity. Among the cathedrals which Mr. PEARSON had under his charge was Lincoln, and the Early English of that building was deemed to be adapted for adoption in the new cathedral. The question of funds had to be considered, and it would have been unwise to have a more ornamental style and then to discover the building could be only partially used. The site, too, was not desirable. But as the committee had to deal with people on the same lines as if they were seeking ground for a new railway station, no better site could be found for the money at their disposal. The visitor who is accustomed to the positions occupied by the majority of English and foreign cathedrals generally expresses surprise on seeing Truro for the first time after passing through a mean environment. The newness of the masonry also appears to be a drawback to those who believe, they know not how or why, that for a building to be a cathedral it must be ancient. Truro will, of course, in time assume the characteristics of age.

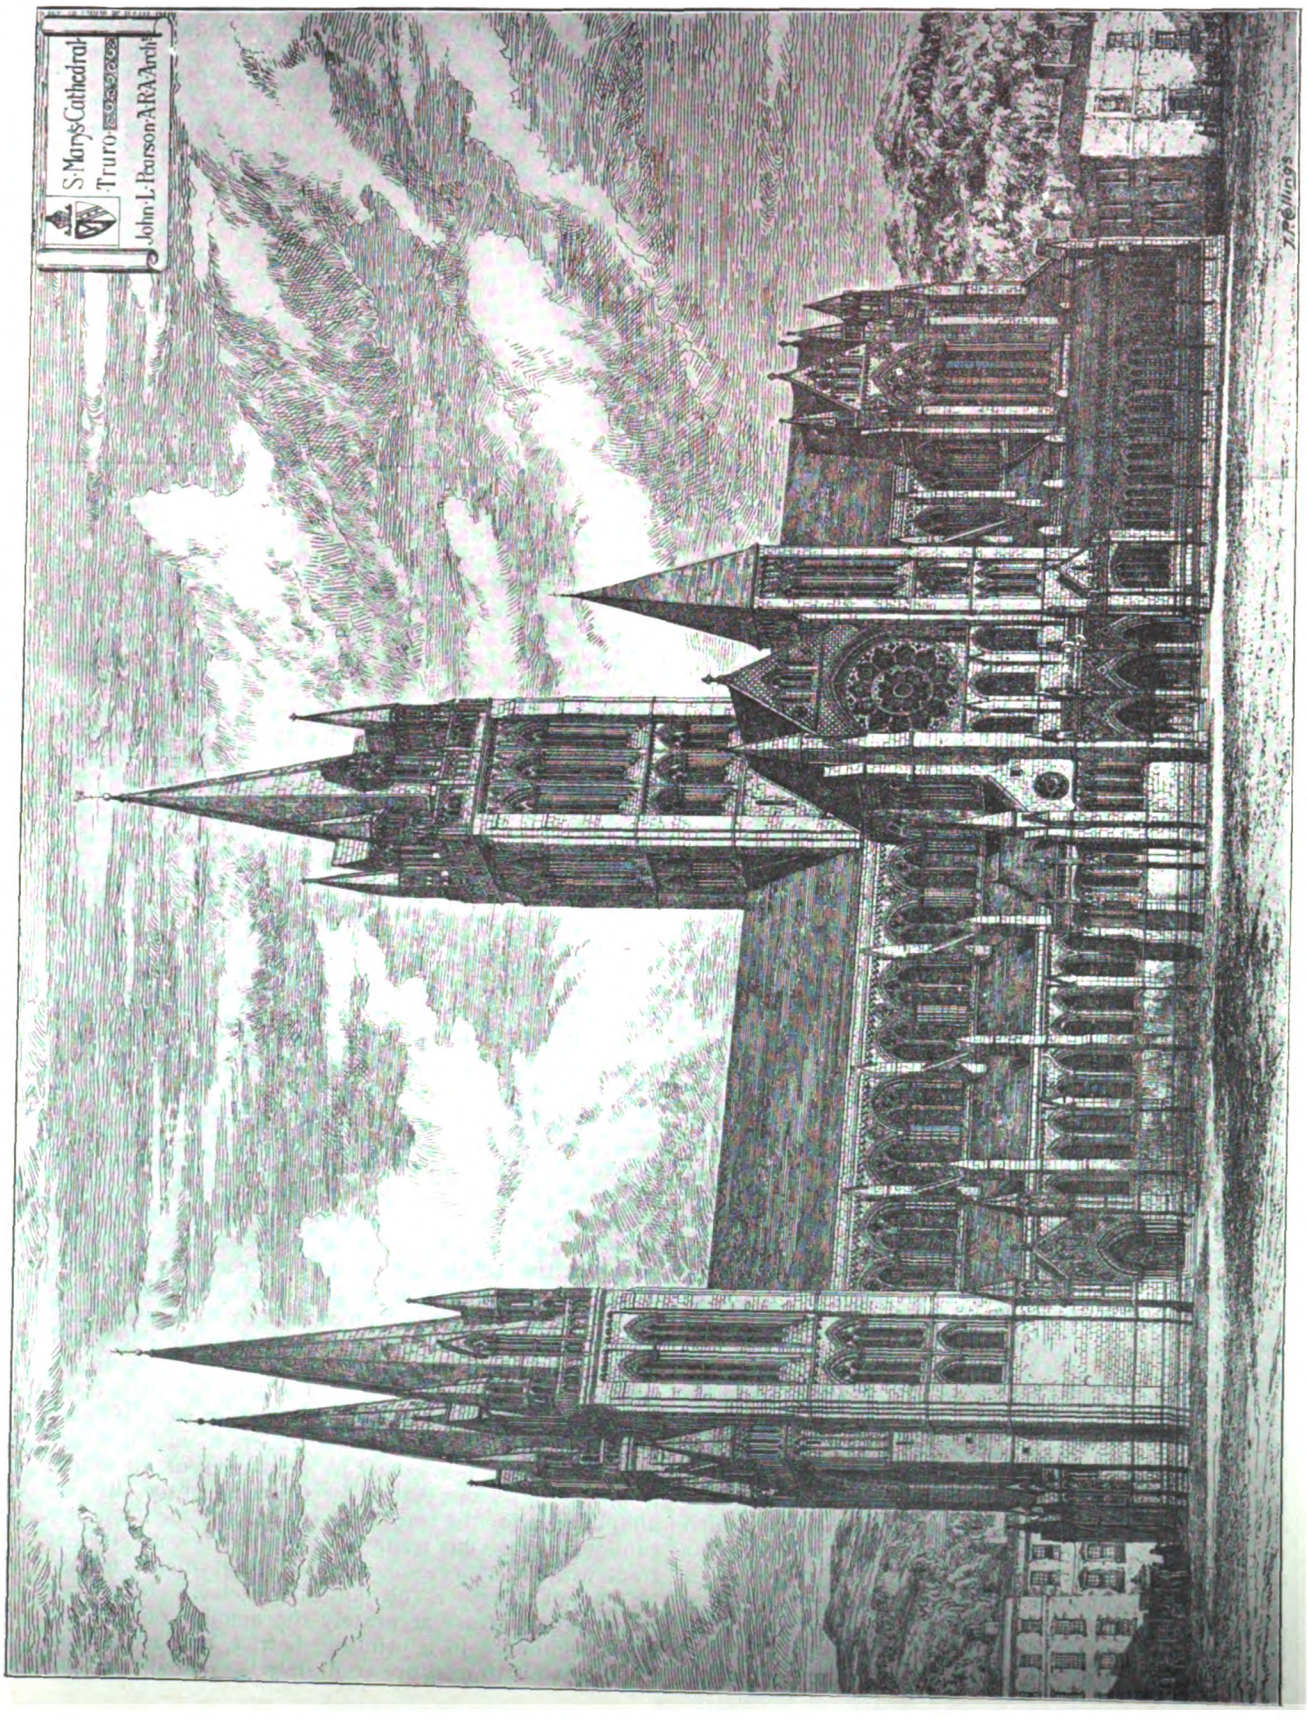
Mr. PEARSON believed that according to the English arrangement there should be a central and two western towers with spires. The whole of the space has been used for the building. The choir, which was the first part erected, is 115 feet in length, the nave being 136 feet. If the crossing be included the total length is 300 feet. The nave is 32 feet in width and each aisle 14 feet. The height to the ridge of the stone vault is 70 feet, and is continuous through nave and choir. The transept measures 110 feet from north to south. There is no lady chapel.

Mr. J. W. BORLAND, to whom we are indebted for photographs of the building, which were taken after careful inspection, supplies the following notes on Truro Cathedral as a subject for illustration :

"From the points of view of the Churchman, the Cornishman and the architectural student, the *chef-d'œuvre* of the late Mr. J. L. PEARSON, R.A., must be pronounced a great and striking success.

"To the first-named it means that the Church in Cornwall is no longer dependent for episcopal direction upon the far-off see of Exeter, as was the case from the Reformation until 1877, but that it now possesses both a bishopric and a cathedral, which form a centre for the revived activities of the National Church in the far west of our isle. To the second, even if not a Churchman, we venture to say that the cathedral is a source of pride, as showing what Cornishmen, headed by their Royal duke, His present gracious MAJESTY, were able to accomplish during, roughly speaking, the last quarter of the nineteenth century, and as providing a fitting place for the memorials of those sons of the Duchy whose deeds deservedly live in our island story. To the architectural student Truro is equally a source of gratification, as proving that in our own times it has been found possible to raise a cathedral worthy to be compared with many of its ancient sisters, and which all who visit it must admit to be really of cathedral rank and not merely a glorified parish church.

"It is a somewhat humiliating thought that while many a splendid ecclesiastical edifice in our land has been allowed to decay altogether since the Tudor break with Rome, and that most of the others have 'suffered many things of many physicians,' with the result that in many instances their state has become 'no better but rather worse,' the Anglican Church had not up to 1877 undertaken a single new cathedral with the exception of St. Paul's, which after all was merely a rebuilding. The only excuse is the fact that the pre-Reformation Church had, to its lasting credit, so amply supplied the needs of the country as to make only few additional cathedrals necessary. Truro, however (shortly to be followed by Liverpool), stands as an evidence of what modern Churchmen, architects and builders can accomplish, and proves that in the present day it is possible to erect a worthy successor to the great cathedral churches of Mediæval times.



"To the amateur photographer, however, who is anxious to secure good exterior views, Truro presents serious difficulties, owing to its having been wedged in as it were in the midst of closely packed and somewhat mean buildings, and placed on the site of a comparatively small parish church. Hence only glimpses of some portions of the exterior are at present obtainable, which in their picturesqueness rather recall some of the great continental churches than one of the typical English cathedrals with spacious close, round which at a respectful distance the characteristic cathedral city has grown up in the course of ages. Ecclesiastically it is no doubt an advantage to be so closely in touch with the city, and the architect of Truro is to be congratulated on having made the best of a cramped site. The unfortunate photographer, however, walks round and round, taking advantage of every bit of rising ground and open space, but finally discovers that certain aspects which he fain would record must be left unrecorded.

"The usual week-day entrance is by the south porch—a fine piece of work, which leads into the south transept, to the west of which stands the magnificent baptistery—a memorial to the famous missionary,

Digitized by Google

HENRY MARTYN, born at Truro in 1781. This unusual position of the baptistery is explained by the fact that the choir, transepts and baptistery were finished in 1887, when the authorities hardly dared to hope to complete the cathedral within the next generation; and thus, in the building as it then stood, the baptistery occupied a normal position. The death, however, in 1896, of the Archbishop of Canterbury, Dr. BENSON, who had been the first Bishop of Truro, gave an impetus to the erection of the nave as a memorial to him, and enabled it to be opened in 1903. Since then the very fine Victoria (central) tower and spire have been completed, being dedicated in January 1904, on the third anniversary of Queen VICTORIA'S death; and thus, with the exception of some comparatively minor features, the cathedral is now practically finished.

"Entering, as we said, by the south door, and advancing towards the centre under the tower, the visitor has on his left hand a view of the nave, splendid in its faultless simplicity, and terminated by the fine west

Digitized by Google

gallery, from whence the best full-length view is obtained. On his right hand is the more elaborate choir leading up to the magnificent reredos, which, with its beautiful setting forth of the Great Sacrifice and its types, very properly forms the chief glory of the sacred edifice.

"Perhaps next to the reredos and the baptistery the feature of the interior which calls forth the greatest admiration is the remarkably clever manner in which the architect blended the south aisle of the old parish church of St. Mary with his cathedral, of which it now forms the south choir aisle, though still possessing all the rights and privileges of a separate parish church. In a new building like Truro, whose very faultless regularity is naturally less attractive to the architectural student with an antiquarian bias than the mixture of styles seen in most of our older cathedrals, this link with the past is peculiarly interesting.

"As the difficulty of photographing this cathedral has been touched upon, it is only fair to acknowledge with thanks the courtesy shown to a humble amateur by Mr. E. C. ARGALL, photographer, of High Cross, Truro, who readily granted the use of his dark room, &c., and in other ways was most helpful." J. W. BORLAND.

HOUSEHOLDERS AND NOISY TRADES.

By W. S. HOLDSWORTH, D.C.L., &c.

THE question how far a man's liberty to carry on his business is limited by the rights of his neighbours to be free from disturbances which injuriously affect their physical comfort or the enjoyment of their property is a question which is constantly recurring. "So use your property that it does no harm to your neighbour" runs one maxim. "A man can do as he likes with his own" runs another. The law must lay down rules to decide which of the two competing views represented by these maxims will be applied to the facts of the various concrete cases arising for decision. The principles which the law applies are fairly well ascertained. To constitute a nuisance there must be a serious interference with the physical comfort of the plaintiff, or material injury to his property. What will be considered to be such a serious interference must depend to a large extent upon the character of the locality in which the acts complained of take place. "A dweller in towns," it has been said, "cannot expect to have as pure air, as free from smoke, smell and noise, as if he had lived in the country." A person who goes to live in Whitechapel cannot expect the same amenities as a person who lives in Park Lane. On the other hand, the mere fact that a man has gone to live near a factory will not prevent him from complaining of the nuisance caused by the factory. It is no defence to say that a man has come to the nuisance. Again, to be actionable the discomfort must be a sensible present discomfort. The mere fact that there is a chance that the defendant's acts may result in a nuisance will give no right of action. "It would have been wrong," it was said in a well-known case, "in the reign of HENRY VI. to have interfered with the further use of sea coal in London, because it had been ascertained or predicted that by the reign of Queen VICTORIA both white and red roses would have ceased to bloom in the Temple Gardens. If some picturesque haven opens its arms to invite the commerce of the world, it is not for this Court to forbid the entrance, although the fruit of it should be the sights, and sounds, and smells of a common seaport and shipbuilding town, which would drive the Dryads and their masters from their ancient solitudes."

Difficulty begins when it is attempted to apply these principles to the facts of concrete cases. When, taking into consideration the character of the locality, the line must be drawn between acts which do and acts which do not constitute a nuisance. The case of RUSHMER *v.* POLSUE & ALFIERI, LTD., which came before the Court of Appeal last December, is a very good illustration of a case which stands upon the border line. The plaintiff was a dairyman who resided at 8 Gough Square, Fleet Street. The defendants carried on printing works in the adjoining house, 10 Wine Office Court. They had recently set up printing machinery in their premises which, as the plaintiff alleged, caused an intolerable nuisance to himself and his family. The defendants denied that their machinery caused any nuisance, and said further, that since the house was situated in a district devoted to the printing trades, their acts done in that locality in the regular exercise of their trade could not constitute a nuisance. WARRINGTON, J., on the evidence, found that even in that locality the printing machinery as run by the defendants constituted a nuisance, and issued an injunction against its further use. The Court of Appeal have declined to interfere with this decision; but the judgment of VAUGHAN WILLIAMS, L.J., leads us to doubt whether it is entirely satisfactory. It was conceded that there was a printing establishment opposite which worked sometimes at night, while not far off were the printing works of the *Daily Telegraph*. It would be inconsistent with established principles, as the learned Lord Justice said, to hold that a nuisance was constituted by the fact that printing work carried on at night caused a serious disturbance to the plaintiff, seeing that such work was carried on in a locality devoted to this particular trade, and was carried on in the usual way. "Nor do I think," he said, "that the fact that the noise of defendant's printing machine was a substantial addition to pre-existing noises would amount to a legal nuisance, if such noise was only the result of carrying on the trade in the district devoted to that trade according to the particular and established manner." But he said that WARRINGTON'S, J., decision might have been based on the fact that the noise caused by the defendant was in excess of that which would have arisen from the proper and established way of carrying on the trade, and though he personally should not on the evidence have come to that conclusion, he did not think that he ought to interfere with the actual decision of the learned judge who had tried the case and seen the witnesses. This view was also taken by STIRLING and COZENS-HARDY, L.J.J. They treated the case as a case of an act in excess of what the defendant had the right to do even in that locality. "It does not follow," said COZENS-HARDY, L.J., "that because I live in the manufacturing part of Sheffield I cannot complain if a steam-hammer is introduced next door, and so worked as to render sleep at night almost impossible, although previously to its introduction my home was a reasonably comfortable abode, having regard to the local standard."

If a particular district is devoted to a particular trade it is a serious thing to throw any impediments in the way of the proper and legitimate development of that trade, not only from the point of view of those actually engaged in it, but also from the point of view of those who live by supplying to those who are thus occupied the things necessary for carrying on that trade. If it is proved that a particular district is thus occupied with a particular kind of trade, we think that there should be very clear proof that a defendant engaged in such trade has been carrying it on in an unusual manner, before the acts done in that trade are held to constitute an actionable nuisance. If every addition to the number of such traders in such districts is to expose the new-comer to the danger of an action it may be a serious matter for the trade of the district, and, indeed, for the trade of the kingdom; for if a trader cannot carry on his trade in a district devoted to that trade without creating an actionable nuisance *a fortiori* he cannot carry it on anywhere else. It is not possible to measure accurately the amount of printing noise legitimate in a printing district, any more than it is possible to measure accurately the amount of light

Digitized by Google

to which a plaintiff is entitled. The House of Lords in the case of COLLS *v.* The Home and Colonial Stores put a stop to such attempts at accurate measurement in the case of the right to light, and decided that it was only a substantial deprivation—a deprivation which amounted to a nuisance—which was actionable. We believe that the case on which we have been commenting is to be taken to the House of Lords. No doubt this view will be presented to their lordships. We hope, in the interests of all traders, that it will be duly emphasised by them as it was in the case of COLLS.

ARCHITECTURE IN 1905.

THE depression from which architecture and the building trade have suffered now for some years in 1905 reached a more poignant depth than even the low level it had reached before. This has been conclusively proved not only by the reports of practising architects, but by the more reliable signs of the returns of unemployed members of the trades unions, which month by month have, with wearisome reiteration, reported almost without exception that the proportion of unemployed was greater than for the corresponding period twelve months previously. This evidence is still further supported by the figures for the number of bankruptcies during the past year, which in the building and timber trades has increased from 628 in 1904 to 645 in 1905, the total number of bankruptcies in the United Kingdom being, for the whole country, the record for eighteen years. Not only the labour returns, but the business in prominent materials, tells the same story. The timber-exporting ports of Northern Europe universally report bad trade with England during the year. The great brickmaking district of Fletton has been in a state of stagnation appalling in its intensity. There, in the early part of the year, the "spot" price had fallen from 30*s.* to 12*s.* per 1,000, and many millions of bricks were in stock. The price of these bricks delivered in London has been dropping still further during the year, and at the present time is lower than it has been for many a long day.

There is, however, a gleam of hope for the future in the reports of improving trade in other departments of manufacture which have been made during the past few months, and there are signs of a gradual improvement in the conditions of the building and allied trades which are encouraging.

Not only in the matter of activity has the past year been a dull one for architects, but their position in the eyes of the law has been distinctly lowered by the judgment of the Court of Appeal in the case of

GIBBON *v.* PEASE,

in which it has been held that the decision in EBDY *v.* MCGOWAN applies to instances in which drawings have been prepared for executed buildings as well as to those in which the buildings have not been erected. So that, in effect, the law says that an architect is a man who makes drawings, not a man who designs buildings, and, being paid for his work as a draughtsman, must give up to his employer the drawings that he is paid for producing.

Nor in the domain of

ARCHITECTURAL POLITICS

can the record of 1905 be deemed a satisfactory one. Although we hold that registration or the enrolment of properly-qualified architects, call it what you will, would make for the better education of architects and a higher ethical standard of professional practice, and would benefit both the art of architecture and the position of architects, we are fully cognisant that registration is undesirable and can never become a reality unless the majority of architects, and still more the majority of the members of the Royal Institute as the representative body of the profession are in favour of the principle.

The Council election of 1904 led us and many others to believe that the majority of members of the Royal Institute was in favour of registration. What are we to make of the election in 1905? Does the complete reversal of the preceding verdict mean that the majority have changed their opinion on more mature thought, or does it mean that, as in our national politics, there is a considerable body of voters, sufficient to tip the balance, who can be swayed first in one direction and then in another by clever electioneering tactics? It would almost seem so, for undoubtedly both in 1904 and 1905 the winning party displayed better generalship in the election than the losers.

Electioneering, however, does not lead to progress but to vacillation and uncertainty, and until the bulk of the members of the Institute and of the profession are sufficiently firm and tenacious in their opinions to give unwavering support to one or other of the opposed parties there can be no hope of betterment for the art of architecture or the estimation of architects by the general public.

Both parties have made an advance during the past year towards their respective ideals.

The advocates of registration whilst in a majority on the Institute Council drew up a draft Bill for the enrolment of architects, and published the text of the Bill in the Institute Journal. They showed a lack of electioneering skill by deferring the publication until after their defeat in the Council election, for they should have encouraged their supporters and justified their re-election by producing the result of their labours before the election.

The opponents of registration followed up the tactical advantage obtained by packing the Board of Architectural Education with their own adherents, and bringing forward with a considerable flourish of trumpets their scheme of architectural education, with Mr. REGINALD BLOMFIELD, the newly-elected A.R.A., as their spokesman. The Board cannot be congratulated on the originality of their scheme, as it is no more than an adoption of the system established years ago at the Architectural Association under the leadership principally of Mr. LEONARD STOKES and Mr. SETH-SMITH, with the advice of the late Mr. ARTHUR CATES and the assistance of many hard workers who, as secretaries of committees, have done the donkey work, but have been ignored by the Board. The system brought into working existence by the Architectural Association has formed the model on which educational methods have been based by University College and King's College, London, by the universities of Manchester and Liverpool, and by many other bodies throughout the kingdom as far as local opportunities and requirements would allow.

The anti-registrationists have also during the past year made an advance toward what both they and we must recognise as the only ultimately successful means of avoiding registration, viz., the elevation of the Royal Institute in the eyes of architects and their employers to the position occupied in the estimation of engineers and the public by the Institution of Civil Engineers. We candidly admit that if the Royal Institute occupied in the architectural profession an equivalent position to that of the Institution of Civil Engineers, there would be no necessity for registration.

Doubtless this is recognised by the more far-seeing of those opposed to registration, and in the advancement towards this ideal the leaders of the anti-registrationists have induced a number of prominent outsiders to allow themselves to be proposed for membership of the Royal Institute with a view to their election at the first business meeting of the new year.

Another great step towards this objective is the attempt that has been made to procure the absorption of the Society of Architects by the Royal Institute, an attempt that has not yet been brought to successful fruition, but of which the present year may possibly see the accomplishment. If the opponents of registration are able to attain this end and to maintain their

Digitized by Google

position at the next Council election, they may feel justified in regarding the question of registration as relegated to obscurity, if not to the Greek kalends.

The subject of competitions has engaged attention at the Royal Institute, and a revised set of regulations for their conduct has been adopted, of which the most important improvement is the recognition of the desirability of three assessors "in the case of works of considerable magnitude." This is a step towards the adoption in England of the jury system, practically universal on the Continent.

There has been heard amongst the rank and file of members of the Royal Institute a certain rumbling of discontent at the tenor of the advice given by the Institute to promoters of competitions. It must be admitted that the personal opinions of the President for the time being tincture the nature of that advice to an extent that prevents the consistency which the public and the profession have a right to expect when promoters seek the guidance of the representative body of architects. It is clear, for instance, that the opinions of Sir Aston Webb and Mr. Belcher do not coincide as to the desirable form of architectural competition for buildings of importance. When the influence of the former prevails the form becomes that of a double-barrelled competition, open in the first place to all comers, from whom are selected a limited number for the final essay, whilst the leaning of the present President is towards a limited competition of architects selected by himself.

As the *raison d'être* of architectural competitions rests upon two points: the production of the best design and the discovery of latent talent—there can be no doubt that the method favoured by Sir Aston Webb is preferable. The objection that many architects of high artistic reputation will not enter an open competition is negatived by the practically universal result that these architects do not win in a limited competition when pitted against a successful contestant in the open arena. It is beyond question that Mr. Belcher's method induces suspicion of favouritism and entirely denies an opportunity to latent ability.

The general dulness of trade, accentuated as regards building by the pause induced in municipal activity by the stringency of money and the diminution of credit, has prevented any great activity in

Competitions.

The most important event decided during the past year—at least from the point of view of magnitude—was the limited competition for the new buildings of King's College Hospital, for which Mr. W. A. Pite was successful and whose designs will necessitate the expenditure of some 400,000*l.*

A more generally interesting struggle was the final stage of the double-barrelled competition for the new central home at Westminster of the Wesleyan Methodist Connexion. For this competition Sir Aston Webb was the assessor, and from the nine very admirable designs submitted he selected that of Messrs. Lanchester & Rickards for first place, from which, there is no doubt, a very fine and effective building will be erected, at a cost of about 140,000*l.*

The other competitors in the final round were Messrs. Mallows & Cross, Mr. J. S. Gibson, Mr. Flockhart, Mr. Vincent Harris, Mr. J. A. Swan, Messrs. Waddington, Son & Dunkerley, Messrs. Cheston & Perkin and Messrs. Crouch, Butler & Savage.

The limited competition for new buildings for University College, London, to be erected at Hampstead, resulted in favour of Mr. A. B. Mitchell, the other competitors being Mr. H. T. Hare, Mr. Paul Waterhouse, Professor Simpson and Mr. Chatfeild Clarke. For three public libraries at Belfast the designs of Messrs. Graeme-Watt & Tulloch were selected.

Amongst the few competitions of importance decided during the year was that for new offices for the Seacombe and Wallasey District Council, in which Sir William Emerson, the assessor, awarded the first premium to Messrs. Briggs & Wolstenholme and Mr. A. Thornely, the second to Messrs. A. R. Jemmett & G. T. McCombie, and the third to Mr. W. H. Ashford. For new schools at Taunton the designs of Messrs. Dare Bryan & Roberts were placed first, those of Messrs. Samson & Cottam second, and those of Messrs. Hans Price & Jane third.

In the competition for several schools for the Bucks County education committee, the assessor, Mr. T. W. Cutler, awarded the premiums for the new elementary school, Aylesbury, first, Messrs. J. M. & H. Kennard; second divided between Mr. A. Hendy and Messrs. Cash & Hack. For the elementary school, Wolverton, the awards were: First, Messrs. Harrington, Ley & Kerkham; second, Mr. F. T. Baggallay; whilst for the new secondary school, Wolverton, the designs of Messrs. Harrington, Ley & Kerkham were again placed first and those of Mr. G. Sedger second.

In a limited competition for the Davies memorial laboratories at Aberystwith for the University College of Wales the designs of Mr. A. W. S. Cross were selected.

The important and well-contested competition for new municipal buildings, Lambeth, was decided by Mr. H. T. Hare, the assessor, in favour of Messrs. Warwick & Hall, first; Mr. H. P. Burke-Downing, second; and Messrs. Crouch, Butler & Savage, third.

A limited competition for public baths and wash-houses at Hammersmith resulted in favour of Mr. J. E. Franck.

For the central public library of Islington the designs of Mr. H. T. Hare were successful in a limited competition. Mr. Belcher, the president of the Royal Institute, was not only the assessor, but selected the competitors, and the result of the competition was a foregone conclusion when the names of the competitors appeared, the list being made up, with one or two exceptions, of architects who have obtained a reputation for artistic ability unaccompanied by success in competition design.

For the new Mitchell Library, North Street, Glasgow, the designs of Mr. W. B. Whittie were selected by the assessors, Mr. A. B. McDonald, Mr. John Keppie and Mr. F. T. Barrett. In the same competition the second place, with a premium of 100*l.*, was awarded to Mr. John Arthur; the third place and premium of 75*l.* to Mr. S. K. Greenslade, and the fourth place and premium of 50*l.* to Mr. J. R. Rhind.

Simply as an illustration of the want of employment by architects at present may be mentioned the competition for a new technical institute at Rochester, a building to cost 8,000*l.*, for which 131 designs were submitted. The first premiated design was by Messrs. Russell & Cooper, the second by Messrs. Crouch, Butler & Savage, and the third by Mr. W. H. Knowles, Mr. F. T. Baggallay being the assessor.

A fine design by Messrs. Nicholson & Corlette was selected by Mr. G. H. Fellowes Prynne as the best in a limited competition for a new church at Epsom.

A remarkable result attended the open competition for a new public library at Hove, when, although over seventy designs were sent in, the assessor, Mr. Belcher, declared that none had complied with the conditions and that none was deserving of a premium. Needless to say, this dictum was received by competitors with a storm of disapproval and incredulity. We are glad to note that the best solution of the matter has been adopted, the authors of ten of the best designs having been invited to enter a limited competition. Let us hope that the conditions may be practicable and the necessity for essential or literal compliance made clear.

Important Buildings Commenced.

In addition to those which we have noted as forming the subject of competitions, the buildings of importance

Digitized by Google

commenced during the past year include: New Council Offices, Woodford, Essex, costing over 19,000*l.*, of which Mr. ARTHUR C. BLOMFIELD is the architect; a new Hydro at Peebles in replacement of that destroyed by fire, and to be carried out from the designs of Mr. JAMES MILLER at a cost of 37,000*l.*; new Post Office Buildings on the site of Christ's Hospital, for which the foundation-stone was laid by the KING on October 16; new County Asylum for Surrey, commenced at Merstham from the plans of Mr. G. T. HINE, and expected to accommodate 1,200 patients. A new theatre in Aberdeen has been commenced from the plans of Messrs. FRANK MATCHAM & Co., and a new theatre in Edinburgh to cost 70,000*l.*, from the designs of Messrs. J. D. SWANSTON & SYME.

NOTABLE BUILDINGS COMPLETED.

Amongst the interesting buildings completed during the past year is the "restoration" of No. 17 Fleet Street, erroneously called sometimes the "Palace of HENRY VIII. and Cardinal WOLSEY."

The continual growth of the suburbs of our towns in general, and of the Metropolis in particular, creates an ever-increasing need for hospitals, asylums and workhouses, and the Acton Urban District Council, in pursuance of the provision of an isolation hospital for their district, have completed the first portion at a cost of 13,000*l.* from the plans of their surveyor, Mr. D. J. EBBETTS.

In Glasgow an extensive out-patients' department, with seating accommodation in the waiting-hall for 400 patients, has been added to the Glasgow Western Infirmary, from the designs of Mr. J. J. BURNET, A.R.S.A. A large out-patients' department has also been added to the Leicester Infirmary, of which Messrs. EVERARD & PICK were the architects. An interesting addition to Cardiff Infirmary has been completed in the form of a new pavilion for electrical treatment, an illustration of the continually enlarging sphere of knowledge which the calling of an architect must embrace, and which must have entailed special study on the part of the architect, Mr. EDWIN SEWARD. A new workmen's hotel at Birmingham on the lines of the Rowton Houses in London has been completed from the designs of Mr. H. B. MEASURES at a cost of 62,000*l.* Another of the houses was recently opened in Camden Town. The Central Public Library of Hammersmith has been completed from the designs of Mr. H. T. HARE, selected in limited competition. For the Manchester Hospital for Consumption has been completed the Crossley Sanatorium for Consumptives in Delamere Forest, which has been erected at a cost of over 70,000*l.* from the designs of Mr. W. CECIL HARDISTY. A somewhat similar institution is the country branch of the Mount Vernon Hospital, Hampstead, which has been erected at Northwood, Middlesex, as a hospital for consumptives, from the designs of Mr. FREDERICK WHEELER, selected in limited competition.

The North British Station Hotel, Glasgow, has been completed after reconstruction from the plans of Messrs. BAIRD & THOMSON. A new lunatic asylum for 1,200 patients has been opened at Napsbury, St. Albans, on its completion under the superintendence of Mr. ROWLAND PLUMBE. The West Cornwall dispensary and Infirmary at Penzance has been completed from the designs of Mr. OLIVER CALDWELL. The Queen's Hall, Hull, a mission building and Sunday school for the Wesleyans, has been opened after erection from the designs of Messrs. GELDER & KITCHEN at a cost of about 23,000*l.* A new hospital for women at Sparkhill, Birmingham, has been completed at a cost of 45,000*l.*, from the plans of Messrs. MARTIN & MARTIN. The new town hall and Council house at Walsall, erected from the designs of Mr. J. S. GIBSON at a cost of 101,000*l.*, has been completed and opened. The new South Shields municipal buildings have been finished from plans prepared by Mr. ERNEST E. FETCH, which were selected in competition; the cost of the work has been 48,000*l.* The new workhouse infirmary, North Evington, Leicester, has been completed at a cost of over 100,000*l.*, from the plans of Messrs. A. GOUGH & TROLLOPE. A remarkable addition to the street architecture of London, completed during the past year, is the new block of premises erected in Oxford Street for Messrs. WARING & GILLOW, from the designs of Mr. R. F. ATKINSON. New municipal buildings at Tottenham have been opened after erection from the designs of Messrs. TAYLER & JEMMETT, selected in competition. Ingram House, Stockwell, with accommodation for 208 residents besides staff, has been completed and opened, the architect being Mr. A. F. BOLTON. A new isolation hospital at Rotherham has been erected from the designs of Mr. JOSEPH PLATTS, and finished at a cost of 19,285*l.* A similar hospital for Harrogate has also been completed at Knaresborough at a cost of 25,000*l.*, from the designs of the late Mr. G. H. STANGER, the works being carried out under the supervision of that architect's partner, Mr. A. W. WORRALL. The Gaiety Hotel and Restaurant, from the designs of Messrs. ERNEST RÜNTZ & FORD, is another notable addition to London street architecture, on which we may congratulate ourselves as a worthy example of modern English architectural design. The new municipal buildings at Deptford have been finished from the designs of Messrs. LANCHESTER & RICKARDS, selected in open competition. The new premises for Coutts's Bank, on the site of the old Lowther Arcade in the Strand, London, of which Mr. J. MACVICAR ANDERSON is the architect, have been completed and opened for business during the past year.

ECCLESIASTICAL BUILDINGS.

The ecclesiastical buildings completed during the year include the new church of the Good Shepherd, Rochdale, designed by Mr. E. H. LINGEN BARKER; the church of St. Cuthbert, Fir Vale, Sheffield, of which Messrs. WEBSTER are the architects; the restoration of Holy Trinity Church, Micklegate, York, from the plans of Mr. C. HODGSON FOWLER; the restoration of St. Bartholomew's Church, Elvaston, from the designs of Mr. G. F. BODLEY, R.A.; the new church of St. John, Kirkby Woodhouse, of which Mr. LOUIS AMBLER is the architect; St. Hilda's Church, West Jesmond, designed by Messrs. HICKS & CHARLEWOOD; All Saints Church, Grimsby, by Messrs. J. E. K. & J. P. CUTTS; the restoration of Finghall Church, Yorkshire, under Mr. BRIERLEY; Holy Trinity Church, Derby, of which Mr. C. E. HEWITT was the architect; Holy Trinity Church, Fernilee, near Buxton, designed by Messrs. CURREY & THOMPSON; St. Nathaniel, Liverpool, from the plans of Messrs. GEORGE BRADBURY & SONS; All Saints Church, Ealing, designed by Mr. W. A. PITE; All Saints Church, Hertford, erected at a cost of 28,000*l.* from the designs of Messrs. PALEY, AUSTIN & PALEY.

CATHEDRALS.

During the past year it has been the lot of Winchester Cathedral to fill the public eye as in urgent need of preservation by immediate repair. As in the case of Canterbury and other cathedrals the mischief is not newly commenced or suddenly inflicted, but has been gradually approaching for years, indeed, one might say for centuries, to the point of imminent danger. Briefly, the underground streams which permeate the lower part of the city of Winchester, until it is as honeycombed as a rabbit warren, have removed the soil on which the Mediæval masonry was planted, so that buttresses hang on to walls instead of supporting them, and walls bridge crevasses instead of standing on solid foundations. Within the last few weeks the continual shedding of fragments from the west front which has gone on for some time past has become acute to danger point, so that the western entrances are now closed and a hoarding is necessary to prevent the bombardment of passers-by with falling fragments. The further restoration of Chichester Cathedral is being taken in hand,

Digitized by Google

though the estimated cost, 5,000*l.*, is moderate compared to the 20,000*l.* that is needed for Winchester.

The cathedral of Iona has been reopened after partial restoration at the hands of Dr. Honeyman, and the restoration of the cathedral of the Holy and Undivided Trinity, Downpatrick, has been carried out under the supervision of Mr. W. Sampson Jervois. The extension of Wakefield Cathedral, commenced from the designs of the late Mr. J. L. Pearson, R.A., has been completed under the direction of his son, Mr. F. L. Pearson.

The new cathedral at Berlin, which has been for several years in course of construction from the designs of Professor J. C. Raschdorf and his son, Professor Otto Raschdorf, was consecrated in February last.

Exhibitions.

During the past year the biennial Building Trades Exhibition was held in the Agricultural Hall, London, and gained the success which the energy and tact of Mr. Greville Montgomery have now led us to expect as its invariable accompaniment. Later in the year an interesting and instructive Electrical Exhibition was held at Olympia, but the show that seemed to most catch the fancy was the exhibition of cheap cottages at the Garden City, Letchworth. The avowed object of this exhibition was to prove the possibility of erecting a farm labourer's cottage complete for 150*l.* The result was, however, to prove the impossibility of this save in exceptional circumstances, chief amongst which are that the landlord who builds must have sufficient knowledge and give sufficient time to enable him to save architect's fees and builder's profit, and must be able to utilise local unskilled labour and materials on the spot. Several cottages were, no doubt, built for the limited sum of 150*l.*, but excluding several little items, such as builder's profit, cartage, water supply, and so on, which in the usual way would run into another 50*l.* or 100*l.* There were several artistic cottages which were not suitable for the agricultural labourer, and which no one would suppose could be built for 150*l.* There were likewise several cheap cottages, which were also nasty, and others of an ephemeral nature that is scarcely commensurate with a 4 per cent. security.

London County Council.

The governing body of the Metropolis has scored a success in the opening of the fine thoroughfare of Aldwych and Kingsway, though the ratepayers have still some time to wait before any substantial recoupment can occur.

The Council have been only moderately successful with their Parliamentary campaign, the London Building Acts Amendment Act being very much reduced from the Bill as introduced. The Act as passed is, however, quite a sufficiently serious matter for property owners in London, as may be gathered from the fact that the Council have already deemed it necessary to indulge in the favourite pastime of municipal authorities, the formation of a separate department for the working of the Act, with a salary list, for the present, of 50*l.* a week for additional assistants.

A site has been found and provisionally adopted for the new County Hall on the Surrey bank of the Thames, adjacent to Westminster Bridge.

Charing Cross Station.

The fall of part of the roof of Charing Cross station has opened the eyes of the public to a fact that has been patent to architects for many a year, that the life of iron construction, protected only more or less by paint, is but brief, and that nothing short of unceasing vigilance and timely renewal will insure the safety of the public against the destructive agencies of corrosion and fatigue of material. We cannot be too thankful that the lesson has been so impressively taught at such a small cost of life and limb, serious enough as this has been to the unfortunate victims of the disaster.

The Law of Ancient Lights.

The importance of the decision in the celebrated case of Colls *v.* Home and Colonial Stores, Ltd., as determining the basis of the legal right to ancient light, has received exemplification in the case of Ambler *v.* Gordon, decided by Mr. Justice Bray, and in the case of Raphael *v.* Buck & Hickman which came before Mr. Justice Warrington.

Honours.

The honours granted during the past year to representatives of the art of architecture included the election of Mr. Reginald Blomfield as A.R.A.; the appointment of Sir C. Purdon Clarke, C.I.E., to the presidency of the Metropolitan Museum in New York, the national museum of America; the award of the royal gold medal to Sir Aston Webb, R.A.

One of the most interesting events of the year was the memorable gathering of pupils, colleagues and friends of Mr. R. Phené Spiers, in testimony of the appreciation universally felt for the great services rendered to architects and architecture by Mr. Spiers in his educational and literary work.

Obituary.

The losses from the ranks of the architectural profession during the year have been more than usually heavy, and include the following: Mr. A. E. Perkins, Mr. J. T. Wimperis, Mr. A. C. Wissenden, Mr. W. Goldsworth, Mr. G. H. Stanger, Mr. Thomas Blashill, Mr. W. Aston, Mr. J. Leaning, Mr. J. Thomson, Mr. J. Barnet, Mr. Cuthbert Brodrick, Mr. G. Fowler Jones, Mr. J. B. Arding, Mr. C. Pertwee, Mr. E. H. Pritchett, Mr. S. J. Nicholl, Mr. F. S. Waller, Mr. T. D. Barry, Mr. G. Henderson, Mr. Frank Caws, Mr. W. G. Scott, Mr. J. Tweedale, Mr. W. Drew, Mr. R. P. Wheelock, Mr. W. H. Dunn, Mr. Joseph Wood, Mr. C. H. Howell, Mr. C. A. Buckler, Mr. C. Forster Hayward, Mr. Alfred Waterhouse, R.A., Mr. J. Weir, Mr. J. K. Colling, Mr. C. G. Maylard, Mr. T. E. Knightley, Mr. Brightwen Binyon, Mr. G. H. Luff, Mr. J. Melvin, Mr. J. G. Waller, Mr. O. F. Stenning, Mr. Helier Harrison, Mr. W. H. Chaney, Mr. J. Bowden, Mr. A. W. Mills, Mr. J. Weller, Mr. John Eaton, C.B., Mr. H. H. Collins, Mr. J. J. O'Callaghan, Mr. W. Moss Settle.

THE ACADEMY WINTER EXHIBITION.

William Hogarth was, we suppose, a dreamer, like other artists; but he could never have anticipated a time when his name would appear for the first and second entries in a catalogue of an exhibition at the Royal Academy. He died before that institution was established; but he was aware of the project and was opposed to it. There is fitness in having so essentially English a painter brought before the eyes of the visitor on entering the first room, for this year's exhibition, with very few exceptions, is devoted to the works of English painters. Hogarth's portraits are indicative of its character, for out of 107 works in the three rooms sixty-two are portraits. The collection suggests, like others of recent years, that it was not carried out on a definite plan, and the arrangement of the pictures is rather confusing. Indeed, chance appears to have had much to do with the contents of the exhibition. But when it is found that the artists range from William Dobson, who worked in the seventeenth century, down to the unhappy Simeon Solomon, who died not many weeks ago, it will be evident that we have varied materials for tracing the progress of the English school. There are, of course, gaps, arising no doubt from the absence of an initiatory idea; but taking the works as they are, they comprise many which are both creditable and interesting.

Dobson, who succeeded Vandyke as sergeant-painter to Charles I., probably painted the king more than

Digitized by Google

once. The half-length portrait which is in the exhibition will be taken at first glance by visitors who do not consult the catalogue as a work by VANDYKE. With such a subject as the king there must be similarity between his portraits. But DOBSON suggests a nervousness which is absent in all the king's portraits by VANDYKE we have seen. DOBSON introduces himself in a portrait group, his companions being Sir CHARLES COTTERELL and Sir BALTHAZAR GERBIER, a work which Dr. WAAGEN considered to be the masterpiece of the painter, who, it may be remarked, suggests that he is the most important figure of the three, and there can be no doubt he is the handsomest. GERBIER'S career was lately described in *The Architect*. He succeeded INIGO JONES as surveyor of the royal palaces, and he opened an academy for the teaching of art and other things. His "Three Chief Principles of Magnificent Building," "Encyclopædia of Art" and "Caution and Advice to all Builders" prove him to be an early writer on construction, and his portrait is therefore worthy of a glance. There is no work to exemplify a period of nearly a century. When the Royal Academy was founded ALLAN RAMSAY held the appointment of principal painter to the king. He was a scholarly artist, but for some reason he was passed over when the first Academicians were selected. There is one portrait by him, *Lady Erskine*, which probably will receive attention on account of the prominence given to the lace, shawl, ruff and sleeves. The same matter-of-fact treatment is seen in the countenance and hands, and we may say it exemplifies the prose of painting. HOGARTH'S portraits are of a different kind, and are among the best in the exhibition. *Edward Montagu* is a boy, not a young prig. *Mrs. Desaguliers* proves that the artist was competent to paint beautiful women, which some critics deny, and the *Painter's Wife* is evidence that Mrs. HOGARTH believed her husband could paint high art, for she is seated beside an easel with a large canvas on it.

Coming next to the period which was marked by the foundation of the Royal Academy, we find that there are no less than eighteen examples by REYNOLDS. The most interesting are his own portraits; one belonging to the Rev. W. H. WAYNE has been often engraved, but in the plates the peculiarity of REYNOLDS'S mouth is exaggerated and made to appear as a defect. The second portrait is nearly similar, but the wig is absent. The grandiose portrait of Dr. ASH, the founder of the General Hospital at Birmingham, is nearly 8 feet in height, and the surroundings are more varied than usual. He holds a plan of the hospital, and behind him is introduced a statue with "Benevolentia" inscribed on the base. Some of the President's journeymen must have been long occupied with this work, and we may also confidently assign to them the wonderful embroidered robe which Queen CHARLOTTE wears, as well as the robes, curtains and architectural background which appear in the King's portrait. The figures in the *Venus and Piping Boy* are not of the Greek or an elevated type. There is a small study for the picture of Mrs. LLOYD as ROSALIND cutting her husband's name on the trunk of a tree. This also is a favourite with engravers. But REYNOLDS would not recognise that the heroine was suited at all points like a man. In truth, he is not seen in force this year, and the same may be said of his great rival. GAINSBOROUGH'S *Two Daughters* will always have value on account of the subjects, but it must be allowed that he was less flattering to them than to ordinary young ladies. One has a portfolio on her lap, the other looks with lacklustre eyes, as if deficient in intelligence, at a statuette. If GAINSBOROUGH desired to reveal that they were not born for art he succeeded. His *Miss Ogle* must have been a charming work; the arm on which the lady rests her head is represented with unusual power; unfortunately the colours are faded. The contrast between this work and his *Felice de' Giardini*, a man whose scarlet coat is as bright as if it were painted a year ago, is remarkable. The other parts of the costume are finely rendered, and GAINSBOROUGH never painted a more characteristic head or a more dexterous right hand. He had a weakness for musicians. Dr. JOHNSON, in reply to a statement of GOLDSMITH'S about GIARDINI earning not more than 700*l.* a year, remarked "that was but little for a man to get who does best that which so many endeavour to do." The violinist was the JOACHIM of his day. Another portrait which must have pleased GAINSBOROUGH while painting it is *William Lewis, the Actor*, who wears the finery of the age. At one time the *Miss Martha Ray* would have had a crowd before it, for the original was the victim of HACKMAN, a clergyman, who shot her in a fit of jealousy and was executed for his crime.

RICHARD WILSON is represented by four landscapes, suggestive of the pseudo-classicism of the eighteenth century, *Lake Nemi, Cicero and His Villa, The Lake of Albano* and *The Unransomed*; the last shows a man in stage costume of the time about to stab a figure who is kneeling. Near them are queer rocks over which water rushes with great force. It is not difficult from the others to realise the principles he adopted for composition. JOHN CROME'S *Preston Town, on the Orwell*, is conventional in parts, but *The Bathing-place, Norwich*, is more natural. Wood, sky and water recall nature. Paintings by WILLIAM MARLOW are not often seen. The view of Florence now appears to be little more than a monochrome, but the detail of the bridge and the houses along the Arno resemble the views of London bridges by SAMUEL SCOTT, who taught MARLOW.

GEORGE MORLAND'S small *Tea Gardens* has been engraved. The chief figure is a woman with a very tall head-dress who is holding a baby; there are other children and two men. *Children Playing at Soldiers*, by the same painter, and his *Nut Gatherers* suggest that the unfortunate prisoner of publicans was at heart a child. Happily, the colours are in keeping with the subjects, and are still fresh and natural. JOHN OPIE, the Cornish wonder, merits more attention as a portraitist than he has received. GAINSBOROUGH would have approved of the *Mrs. Warde*, who looks out from beneath a very large straw hat, of which the strings are tied in so curious a way they divert attention from the face. A second work is *Master Impey*, an experiment mainly in browns, and which may be the picture he first exhibited in London before he had enjoyed opportunities for studying painting. Sir HENRY RAEBURN found a noble head in one *John Gilbert, Esq.*, and his broad manner has done justice to it. It is the most satisfactory of the examples by him in the galleries. We cannot see one of ROMNEY'S most successful class of paintings. There is a head of *Mrs. Yates*, the actress, who does not appear to be posing; although it is only a half-length the figure in some way suggests a physical defect. The *First Earl of Yarborough*, another half-length, is effective without any sign of artifice. A full-length *John Bensley Thornhill* shows a boy in a most unboyish attitude with his head supported on his right hand, his feet crossed and his right arm resting on a ledge. If it were not for the latter he could not stand in such a position. *W. R. Cartwright of Aynhoe* continues to be very brilliant, and suggests either a lawyer or a parson. The *Elizabeth Lady Holland* represents a châtelaine who exercised despotic power over Whig politicians when they visited her house at Kensington. ROMNEY has not only painted the face with an appreciation of her beauty, but has condescended to give the details of the dress with unusual attention. The one portrait which is supreme is HILTON'S *Mrs. De Wint and her Daughter*. If called *Maternal Affection* or *Child Worship* it would have made a popular engraving. A young woman in white holds a plain child in her arms, who plays with her hair. The mother looks on the child with love and wonder, like a votary before an idol. HILTON was devoted to high art, and suffered in consequence. If he could have humbled himself to paint portraits it is evident from

Digitized by Google

this example he would have surpassed his contemporaries in the early part of the nineteenth century.

It is with a sense of relief the majority of visitors will enter Galleries No. IV. and V., which contain works of English artists who recently were working. Never before was such an opportunity presented of appreciating the work of SIMEON SOLOMON, and the conclusion must be drawn that through his own waywardness he failed to do justice to his extraordinary talents. Mr. HOLMAN HUNT made efforts which must be called heroic to present to the world types of the Israelites. But as if by instinct SIMEON SOLOMON realised those types in a way which has never been presented more impressively. In his daily life he was as irregular as MORLAND, but in the sixteen paintings and drawings at the Academy we can detect no careless strokes. In spite of depravations the man was a mystic and he was especially successful when his subjects were beings who were endowed with a like gift. Priests have been often represented holding a monstrance, but when was worship of the unseen shown with such power as in the figure of a young priest, called *The Mystery of Faith?* Another figure of the same kind is a young Israelite harper, who in a balcony is raising his hosanna. *The Finding of Moses* and *The Mother of Moses* should be recognised by publishers of the Bible as adapted for illustrations of the scenes in Exodus. His power was not restricted to one class of work, for in *Love and Winter*, an almost nude figure of a woman, we have a painting which is worth acres of the BURNE-JONES class of allegories. In water-colours SIMEON SOLOMON was as skilful as in oils. His paintings have the rare quality of suggesting much more than appears on the canvas or paper.

There is only one oil-painting by JOHN FREDERICK LEWIS, *An Intercepted Correspondence: Cairo.* It will sustain a comparison with any pre-Raphaelite work, for when was an Egyptian interior represented with greater fidelity? The colours could never have been more brilliant. His *Spanish Fête*, one of the water-colours, contains many figures of peasants enjoying themselves under a vine-covered pergola, which allows a display of that light and shade in which LEWIS delighted. There are other drawings of eastern subjects also by him. By ALBERT MOORE is one work, *White Hydrangeas*, the plants being accessories to a nude female figure who stands near an inlaid doorpost. This is a painting to which the term harmony could be applied without abuse. Few pictures caused so much excitement as *Sir Isumbras at the Ford* when it appeared at the Academy in 1857. It was hieroglyphics to many, but it is easy to understand CHARLES READE appearing as a lunatic before Mrs. MILLAIS and declaring fiercely, "I simply must have that picture though I am but a poor man. I would write a whole three-volume novel on it, and then have sentiment enough to spare." Afterwards he wrote to MILLAIS, saying, "I am very proud to possess it. Either I am an idiot or it is an important work." Later it came into the possession of Mr. ROBERT BENSON, who lends it. A Colonel CAMPBELL was the model for the knight, and MILLAIS's eldest son for the little boy. The bridle and trappings were originally simpler than they now appear, having been altered at Mr. BENSON's desire. RUSKIN, who had broken with the artist, declared that he was unable to comprehend the meaning of the picture, and it might mean either a knight returning weary in the evening, or a type of human life tried in war, or the angel of death bearing children whither they know not. But, on the whole, he regarded it as no more than a rough sketch of a great subject in which everything was wrong. Although it was evening the figures were treated as brightly as in sunlight. The water was brighter than the sky, the armour does not reflect colour, the saddle-cloth and the peacock's feather were considered to be alone worthy of praise. Whatever may be its meaning the painting seems destined to be enduring, and the human expression of the faces of the old man and the children are fatal to the monstrous *Mnemosyne* of DANTE GABRIEL ROSSETTI and the doleful inanities of Sir E. BURNE-JONES which are near it. To place examples of BURNE-JONES and ROSSETTI in a room containing works by MILLAIS, SOLOMON, ALBERT MOORE and WATTS was to submit them to a test which they could not withstand. The Winter Exhibition of 1906 should at least dispel two delusions.

In the same room there are two views of Whitby by A. W. HUNT, which he never surpassed often as he selected the same subject. He is more scenic in the *Drachenfels on the Rhine*, which is in the next room. The painting of the *Grand Mosque of Damascus*, by Lord LEIGHTON, would not at first sight be taken for his work. The building no longer exists, but the painting appears to represent the interior with fidelity, although the artist has sacrificed his own peculiarities. There is a single painting by P. R. MORRIS, *The Mowers*, in which the rhythmic movement of the men is suggested simply but forcibly. Water has been introduced into several of the paintings of the exhibition, but the only painting which indicates its power is *Running Water*, by GEORGE P. CHALMERS. He did not always do justice to his abilities, and he is mainly known as a portraitist. But here we have a spate of a kind which not one of the artists who makes such subjects a specialty has been able to rival: a companion picture of a wave should have been obtained to show the power under different conditions. DAVID ROBERTS should have popularised the ecclesiastical architecture of Belgium, that is, if paintings were competent to overcome the public indifference to the art. His interior view of St. Gomar, Lierre, is characteristic, and the only fault Mr. RUSKIN could find with it was that the painted glass of the windows appeared to be darker at the bottom than the stone used in the jambs. C. R. LESLIE's *Picnic* is not in his usual style, for he was most successful in what are known as costume paintings. Here we have a modern picnic of humble people, and the principal figure appears to be enjoying himself by reading a newspaper. All the parts are carefully painted, and by an artist like JOHN LEECH would be considered an excellent production for a journal. But LESLIE is not associated with anything later than the eighteenth century, and we expect more dignity in anything from his hand. *Milton visited by Andrew Marvell* is one of BOUGHTON's careful works, introducing the faces which became familiar in other paintings. ETTY's *Homeric Dance* is vigorous enough, but it would not serve as an illustration to either the "Iliad" or the "Odyssey." J. W. INCHBOLD began by painting moorlands, and some critics supposed he was competent for no other class of work. But his *Drifting* is a delightful view of Lake Leman and the mountains of the background.

In the Water-Colour Room TURNER reigns. Mr. F. H. FAWKES has lent six or seven drawings which are marvels as presenting scenes mainly in the Alps. The two *Falls of the Reichenbach* fortunately do not appear to have much faded. Among the oil-paintings is a surprise in TURNER's *Venus and Adonis*. There are also some gems of art by FREDERICK WALKER, which originally appear to have been prepared for the illustration of stories. The *Cassandra Fedele*, by Sir F. W. BURTON, is not the Trojan prophetess, but it is enough to refute those who assert that the artist could not draw. *A Side Canal, Venice*, by JAMES HOLLAND, is faithful, but his best work is the view of the Campo di San Giovanni e Paolo, with VERROCCHIO's equestrian statue of COLLEONI. The Black and White Room is filled with about eighty studies and drawings by G. F. WATTS, which he has bequeathed to the Royal Academy.

The foreign masters are not numerous. By VANDYKE is a very large *St. Sebastian*, which seems divided into two equal parts, one occupied by the nude figure of the saint, the other by a mounted officer who superintends the preparation for the martyrdom. The body of the saint does not suffer from arrows. The

Painter and His Family, by FRANK HALS, measures 6 feet 7 inches by 9 feet 4 inches. The artist and his wife, a son and daughter all stand in a line, and all are grinning. The work is evidently an artistic freak, which no doubt gave rise to much laughter from visitors at the house in Haarlem, especially as FRANK HALS is booted and spurred as if he were a cavalier. The figures are dressed in black varied by a little white. The painter knew as well as any of his contemporaries the value of the principle expressed in the words *rien de trop*, and black and white are not colours which afford perpetual delight. In another picture JORDAENS represents himself as if he were a satyr looking through a stone opening along with his wife, who is a buxom blonde. By HENDRIK DUBBELS is a *Calm with Boats*, in which the water is as white as the sky, and the boats appear to be resting on some novel support.

CHRIST CHURCH CATHEDRAL, DUBLIN.

A LECTURE was delivered in Christ Church Cathedral, Dublin, on St. Stephen's Day, by Sir Thomas Drew. Addressing a large audience from Strongbow's tomb, he again related the history of that warrior, of his sister Basilea, the wife of Raymond-le-Gros, and of Laurence O'Toole, their ally, the Hiberno-Danish Bishop of Dublin, who received the invaders in friendship and joined with them. Laurence was no Dane, but an Irishman of gentle birth. He was educated at one of the famous Irish seminaries, travelled much, and was known in Rome as a distinguished man, and at Dublin as the friend of the poor. The character of Laurence was succinctly sketched by the lecturer, who also described the method by which he sought to reform the administration of the service of the Church by bringing from Flanders a community of canons to supersede the community of Danish seculars. Further, Laurence, according to his "Life," first "caused men and boys in the cathedral at Dublin to stand in order about the altar, and lend to their service decorum and to their voice harmonies." It is possible, therefore, to date at 1165 the introduction of choral worship, which has been maintained by unbroken devolution, if in varying form, in the church of Laurence for over 700 years. Laurence influenced the gentlemen immigrants to mark their possession of the land by founding for him a nobler church, such as he had seen in other lands, and Strongbow, FitzStephen and Raymond-le-Gros were, according to the record, the co-founders, with Laurence himself, of that church. The lecturer then described other interesting events which have found a place in the history of the cathedral, and which, as they occurred in comparatively modern times, are known and understood by the general reader.

Application is to be made to the Local Government Board by the Essex education committee for a loan for the enlargement of the Vange schools, the plans for which they have just passed. They have also accepted the tender of Mr. J. T. Ruffell, of Hockley, Essex, for the enlargement of the Hawkwell school, and are about to erect new schools at Thundersley.

SMALLPOX HOSPITAL, WALSALL—CARETAKER'S COTTAGE.

THE accompanying illustration represents a cottage recently erected by the Corporation of Walsall for the caretaker of the Walsall smallpox hospital. Messrs. Wootton & Sons, of Bloxwich, near Walsall, were the contractors for the work, which has cost 250*l.* The plans were prepared in the office of Mr. R. H. Middleton, Assoc.M.Inst.C.E., borough surveyor, Walsall.

NOTES AND COMMENTS.

THE Royal Victorian Institute of Architects have displayed courage in suggesting an amendment of the Melbourne by-laws to the effect "that the official referees be empowered to approve plans of buildings, provided that such plans are in accordance with the building regulations of certain of the principal cities of the world, the list of such cities being agreed upon. The above to be applicable to additions to and subdivisions of old buildings, as well as to new buildings." The Melbourne City Council must be more generous than similar authorities if they will agree to be bound by foreign precedents. For other amendments the practice followed in Chicago is recommended. The use of steel or iron construction is suggested as a remedy in some cases. For example :—"That the official referees be empowered to allow buildings to be raised to additional heights without thicknessing the existing walls provided that sufficient extra strength and stability be obtained, by steel or iron construction attached to such existing walls, but with independent foundation; that the centre of gravity of an external cornice be that of the whole cornice (including the portion in the wall), and that the centre of gravity shall be within the wall, in lieu of present by-law, and that steel construction for cornices combined with fireproof materials be allowed." In the case of alterations to existing buildings, it is suggested that slow-combustion materials, such as Uralite, asbestos, &c., should be allowed in ceilings, &c., in lieu of party arches. Evidently in Melbourne they are advanced in their ideas, and it will be satisfactory if the proposed amendments are sanctioned.

IF a plot of land is vested in a public body under the provisions of the Metropolitan Open Spaces Acts, 1877, 1881 and 1887, and the Disused Burial-Grounds Act, 1884, the obligation imposed by those Acts of keeping such plot free from buildings does not prevent the public body from taking measures to prevent the adjoining landowners from acquiring an easement of light, even though this involves the erection of a screen. This very sensible decision was arrived at by the House of Lords in the case of the Mayor of Paddington *v.* The Attorney-General, reversing the decision of the Court of Appeal, and restoring the decision of BUCKLEY, J. The decisions are numerous, and possibly conflicting, as to the circumstances under which a screen may be a building. But it was perfectly obvious that there was no intention in this case to erect a building. There was merely an intention to do what every prudent landowner would do, and what every public body which has land vested in them for public purposes ought to do, *i.e.* take good care that the value of the land in question was not deteriorated by allowing others to acquire easements over it.

AT the last meeting of the Glasgow Corporation the subject arose of the erection of buildings in Hope Street on ground which had been obtained in the course of the widening and improvement of the street. It was recommended by the statute labour committee that Mr. JOHN KEPPIE, of Messrs. HONEYMAN, KEPPIE & M'INTOSH, should be appointed architect, and that the property to be built should consist of shops, with dwelling-houses not exceeding five rooms and kitchen on the upper floors—the precise accommodation to be again considered in consultation with the architect. Some of the members advocated that the city engineer should be appointed architect. Others considered that smaller houses would be more suitable. After a discussion the appointment of Mr. KEPPIE was carried by a majority. The conclusion is satisfactory, for in Glasgow, as in a great many other places, there is a desire to give a monopoly of as many buildings as possible to the engineer or surveyor. The advantages that are said to follow are rather indefinite. As regards economy it is difficult to judge, for the preparation of the accounts of corporations and local authorities is a branch of science into which there must be a special initiation.

THERE is much commotion among the house painters of Paris at the present time because the Government propose to prevent by means of a new law the use of *céruse*, or carbonate of lead, which is commonly known in England as white lead. The workmen arranged to have an interview with the President of the Senate on Monday last in order to remonstrate with him, but steps were taken to disperse the crowd. It has been generally understood that for more than half a century the danger of *céruse* was recognised by Frenchmen, and that oxide of zinc or zinc white was preferred. But the old belief still prevails that there is a connection between high wages and danger. There are many house painters in Paris who take a reasonable view of the Governmental project, for they have suffered by using white lead. Between the two divisions the authorities will have to judge, and their decision will not be determined by any threats.

IT is believed that a new building will be erected in Manchester which will serve for a reference library and a museum of art. The Manchester Art Gallery committee have prepared a report suggesting the extent of the accommodation which is desirable. At present the only paintings are representative of the modern British school. But it is considered desirable to have works of other schools and of other periods. There should be a collection of casts, but more complete than what is seen in Aberdeen. A print-room and an art library are necessary, and the contents should not be confined to drawings, engravings and etchings of the classes admired by amateurs, but should also include a collection resembling one at Cologne which would be of special utility to the workers and craftsmen of the Manchester district. Provision should be made of separate galleries for temporary and periodic exhibitions. A lecture-hall is also necessary. It is suggested that there should be special rooms for collections relating to Old Manchester, illuminated manuscripts, bookbinding, &c. It is considered by the committee that when a home is provided for collections gifts will be soon forthcoming.

ALTHOUGH the American Society of Civil Engineers could not agree to Mr. CARNEGIE's conditions for erecting a building in which several societies were to meet, the electrical, mechanical and mining engineers have adopted his views. Messrs. HALE & ROGERS with Mr. H. G. MORSE are the architects for the Union Engineering building, while Messrs. WHITFIELD & KING have received the commission for the Engineers' Club. The floors are arranged in such a way that each will have a separate location. There will be in addition rooms in which members of all the bodies can unite. On the first floor there is a hall which will hold a thousand people. There are smaller lecture halls for ordinary meetings of the societies, and on the two upper floors will be their libraries. Members can utilise all the libraries, and in that way will have at their disposal an exceptional amount of varied information. Provision will be made to accommodate other societies. Care has been taken to prevent adjoining premises from attaining a height which would interfere with the lighting of the Union Engineering Building, which has a frontage of 125 feet and a depth of 100 feet. The structure will be ten storeys in height.

BRICK CHURCHES IN NORTHERN GERMANY.

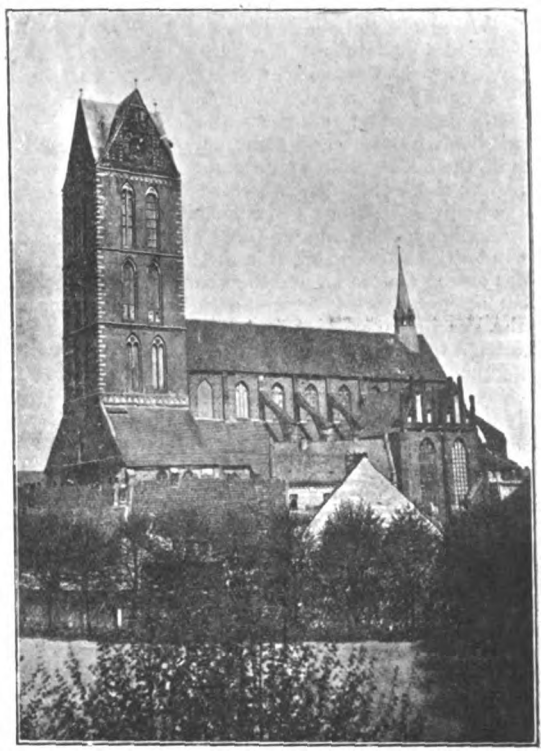
By T. FRANCIS BUMPUS.

TO one who has grown up with an admiration for the sturdy breadth, the long, low proportions and the simple dignity of the Gothic churches of England, the vast sky-aspiring thirteenth-century churches of France, or their contemporaries with which the Rhenish provinces are so richly endowed, those of North and North-East Germany hardly make so strong an appeal. But the true spirit of progress is to have a receptivity of mind which will enable one to discriminate and absorb as much of the good quality of every varied style as may be consistent with a sound view of art, and there is much to be learnt from a study of the great churches which so proudly dominate the cities of Mecklenburg, Pomerania, Prussia and Silesia.

The surface of that part of Europe which I have indicated is composed of sand or clay, and affords no other building stone than granitic boulders, supposed to have been transported thither from the Scandinavian mountains. These boulders furnished the stone from which many churches were built in the twelfth and earlier part of the thirteenth centuries; but the deposit, being superficial, was soon exhausted, and the hardness of the material precluded the use of ornamental detail. When, therefore, the progress of civilisation and luxury created a desire for buildings of grander proportions and greater wealth of detail it was necessary to seek for other materials. These were found in the clay of the country, and brick came into use, either exclusively, as in Prussia and Pomerania, or partially, as in parts of Poland and Silesia, where sufficient freestone for dressings and ornamental parts could be obtained at a moderate cost. Elsewhere stone, when wanted, had to be shipped from Scandinavia, an expensive process in Mediæval times.

In the hands of people like the North Italians, or of the country about Toulouse, brick was generally manipulated with much skill, but as the Baltic Germans were of all European peoples the least artistic, it is impossible to assign a premier place in the history of Mediæval architecture to the churches of these northern states.

Still, if no very high degree of merit can be claimed for them on the score of graceful contour, these structures deserve notice as well from the student of architecture in general as from him who confines his attention exclusively to those of the Middle Ages: from the first, as affording remarkable and perhaps suggestive examples of decoration in a material usually treated as little susceptible of ornament, and from the latter as exhibiting a peculiar phase of Pointed architecture.



It is as interesting as it is instructive to observe in the best examples how the architect, instead of forcing his material into forms and combinations for which its nature was but ill-suited, took advantage of its peculiarities, and gave us buildings which, if not elegant, are dignified and impressive, frequently picturesque, and from their height and spaciousness presenting us with not a few subjects for imitation in our own town churches.

Romanesque and early Pointed churches are scarce in this part of Germany. This is attributable partly to the late introduction of Christianity into these regions, and partly to the predominance of the Hanseatic League in the fourteenth and fifteenth centuries, when their cities, like those of the Low Countries, having reached the zenith of their importance and prosperity, buildings of a humbler class were superseded by others of grander dimensions.

Brick is used intermittently all over the north of Germany, but its almost exclusive employment is confined to a trapezium, whose lines, if traced on the map, would extend from the mouth of the Elbe to Dresden and Cracow on the west and south, and from Cracow to Königsberg, along the Baltic coast, to Lübeck on the east and north.

ST. GEORGE'S, WISMAR. INTERIOR, LOOKING EAST.

ST. MARY'S, WISMAR, FROM THE SOUTH-WEST.

Starting at the north-west corner of our trapezium we find Lüneburg. Next, a little to the north-east, comes Lübeck, and then, keeping close to the indented shores of the Baltic, Ratzeburg, Schwerin, Wismar, Rostock, Stralsund, Greifswald, Anclam, Prenzlau, Stettin, Stargard, Colberg, Danzig, Marienburg, Frauenberg and Königsberg.

Then, following the courses of the Elbe and Oder, with their tributaries the Havel and the Neisse, are Havelberg, Stendal, Tangermünde, Jerichow, Brandenburg, Frankfort, Breslau and Neisse. In addition to these there are innumerable places lying off the beaten track, whose ecclesiology could only be thoroughly investigated by those with overmuch leisure.

In Westphalia and Saxony the prevailing type of church during the thirteenth, fourteenth and fifteenth centuries was that thoroughly indigenous one having a vaulted nave and aisles of the same height, and in some instances of the same breadth,* included beneath one high-pitched roof, and a choir—shallow if the church were parochial, deep if collegiate or conventual—and terminating sometimes rectangularly, but more frequently in an apse of three or four sides, and generally without an aisle round it.

This "hall" type of church makes its appearance in the

* In the Dom at Erfurt the aisles are wider than the nave.

Digitized by Google

brick district now under review, as, for instance, in the vast Marien Kirche at Danzig, at Königsberg, at Rostock, and in the graceful church at Prenzlau, but most frequently in the city of Brandenburg, where almost every church is what is termed a "dreischiffige," literally "three-naved" or "shipped" church. Even more common in the extreme north is the lean-to aisled and clerestoried church with the apse and procession path, from which chapels occasionally radiate. This brick architecture moved with the German colonists from the Weser to the Vistula, and if, as is supposed, its original home was in the Netherlands, the *raison d'être* of the clerestoried and chapel-surrounded church is made clear.

The cruciform plan is not very frequently met with, being confined chiefly to churches that were the seats of bishops or the centres of conventual establishments, as, for instance, in the purely Romanesque cathedral of Ratzeburg, in the mixed Gothic ones of Brandenburg and Lübeck, and in the complete Gothic one of Schwerin; in the Romanesque Premonstratensian church of Jerichow, near Stendal, and the fourteenth-century Cistercian one of Doberan, near Rostock. Occasionally we find a great cruciform parish church such as the clerestoried ones of St. George at Wismar and St. Mary at Stralsund, and the vast "hall" one of St. Mary at Danzig, but the most usually adopted plan appears to have been that which consists simply of a clerestoried nave and choir under one line of roof, after the model set by St. Mary's, Lübeck, and which was followed at Stargard, Stettin, Stralsund, Wismar and elsewhere.* Founded as they were by the citizens, and standing as they did in the closest connection with the civic community, the modest dimensions of the choirs of these great town churches distinguish them from those in which accommodation was required for a large body of regular or secular clergy. The civic mind likewise finds expression in the singular mixture of boldness and sobriety exemplified in the loftiness of the nave and towers on the one hand, and the sparing use of superfluous ornament on the other, as well as in the preference shown for the spacious, the airy and the perspicuous. To find several churches over 100 feet high internally is by no means uncommon in these parts.

There is one feature in these great Baltic churches rarely if ever found in the central and southern States of Germany, viz. the private chapels formed between the buttresses, and in some instances extending completely round the church.

The extraordinary number of these chapels is accounted for by the desire of the rich burger to perpetuate his name, and where, as for instance in St. Nicholas at Wismar, these chapels have succeeded in retaining some of their ancient furniture and decoration, the effect is very picturesque.

(To be continued.)

MR. F. H. KIMBALL ON SKYSCRAPERS.

(By our New York Correspondent.)

SEATED chatting with Mr. Francis Henry Kimball, New York's pioneer architect in "skyscrapers," one soon becomes so engrossed in the subject of a modern American city's office buildings as to forget the position of a professional draughtsman's working room on a twenty-second storey, nearly 300 feet above noisy Broadway's street level. Yet a look out of the window through the balustrade shows you the Hudson glistening far below, with ferry boats darting hither and thither in the passage to and from the Jersey shore. Away to the north stretches New York proper on Manhattan Island, but immediately in the foreground, across the churchyard of Old Trinity, the eye on the same level rests on the topmost storey of the latest triumph of the New York architect's art, the Trinity Building. We are in the Empire Building, a towering structure with the narrow front of 78 feet along Broadway, but enjoying a façade twenty-two storeys high and more than 200 feet long, directly facing the open area of Trinity churchyard. The "pioneer skyscraper" of New York is the Manhattan Life Building, within a stone's throw across Broadway. High office buildings of more than twelve storeys and the era of rapid construction date from its erection, and that is only thirteen years ago. Mr. Kimball brought wide and valuable experience to the mastery of the new difficulties confronting the builders. He solved problems which had never before claimed the attention of architects, and introduced new methods of construction hitherto unattempted in buildings. He sunk foundations to bed-rock through treacherous soil by caissons under pneumatic pressure, first introduced in this instance, and the fresh experience gained was later utilised with full success in the erection of the Empire Building, executed between May 1897 and May 1898, and later in the case of the Trinity Building, also begun and finished within a year and opened with a full supply of tenants last May-day. Behind the Trinity Building the foundations are now being laid for a twin skyscraper on the site of the old Boreel Building, adjacent to Thames Street. This in the same way is to be finished and ready for occupation in 1907 on May 1, the customary date for tenants in New York to begin their leases.

Francis Henry Kimball, *Architect.*

The last few weeks have been a strenuous time for Mr. Kimball, the architect employed by the United States Realty Company, the owners, to carry out their undertaking. For two months or more the architect and draughtsmen are working at full pressure, drawing out plans and specifications, and busy with the multitudinous details in supervising the work of the contractors, who have done the wrecking of the old building and are preparing to excavate the site and lay the foundations by sinking caissons and embedding them in concrete. The invention of the elevator, or lift, rapidly and safely worked by pneumatic or electric means, created the skyscraper, making buildings of twenty storeys possible, perhaps of forty in the future, though it is hardly conceivable that these will pay their owners.

"How did I invent the caisson?" said Mr. Kimball after my question. "It was like this. I was employed on the New York Theatre and had to build up the stage wall next to a property whose owner would not let me underpin his wall or use it for support. I came to the conclusion to build my foundation by setting concrete round caissons. There was no contractor then willing to undertake the job, but eventually I obtained cylinders of the size and strength I required and dropped these down to the bed-rock. When the wall, based on these, went up, the owner brought suit that his wall was interfered with, but the judge ruled him out of court. Then came the Manhattan Life Insurance Building. I knew the nature of the ground, and used the same method. Broadway is the backbone of Manhattan, and on either side the rock is crumbly. However, we laid a sure foundation after sinking the caissons, and in the new skyscrapers bordering Trinity Church have raised our immense buildings on a base, if possible, still firmer.

"Just as the Empire Building was the most complete structure of the advanced class of American office buildings combining architecture and utility, so the Trinity Building is a conscious endeavour to give a type of modern high-storeyed office building exhibiting magnificent strength and a high degree of beauty without affectation, with symmetry of proportions, and complete and agreeable harmony of parts. In the Empire Building the main expression is

* A quasi double transept, of the same height as the aisles and gabling out of them, occurs at St. Mary's, Lubeck, and at the Wismar churches of St. Mary and St. Nicholas.

Digitized by Google

Early Italian Renaissance, with features that are Græco-Roman. New York's best buildings exhibit detail founded upon the work of the Italian Renaissance, and the Empire Building's simple lines and Classic details recall the spirit of the palaces of Florence and Genoa and Rome, as distinct from the Chicago buildings, whose

NEW YORK'S PIONEER SKYSCRAPERS—NEW TRINITY BUILDING ON LEFT.

designers have largely borrowed their detail from the Romanesque work of the South of France. In the Trinity Building, however, I have tried to introduce greater harmony with the Gothic style of Trinity Church. That of course is the ecclesiastical Gothic"—and we had only to look upon the crocketed spire, the apex of which barely reaches the top of the skyscrapers adjacent, to illustrate the remark. "But I should prefer to call the new office building an adaptation of the Gothic style, a 'Civic Gothic,' differing from the strict Ecclesiastical and from the Gothic as used by the Victorian Gothicists in England, who use it, as in the case of Street's Law Courts in London, with all the detail of Mediæval turrets, traceried windows and Pointed vaulted corridors, at the expense, I am afraid, of light and ventilation. In the Trinity Building as originally designed there were turrets at the ends. These, it was thought, could be dispensed with, but in the completed design, when the twin sister skyscraper is completed on the Boreel site, the tower which you see in the original design will bring the roof into harmony.

"In the execution of the Trinity Building I suppose I have been influenced by the feeling I acquired early in my career in my training under Burges, your one great architect. I naturally have a preference for his design of the Strand Law Courts, which was in competition with Street's, though it lost the award." Here Mr. Kimball brought down from a shelf the book of the Burges design, showing how that architect would have worked in Temple Bar, or rather a substitute bridge from the Temple to the Courts, instead of the griffin which now marks the site of the old gateway.

"You know," he continued, "I was for a year or two a draughtsman in Burges's office, and well I remember my arrival in London with my wife one Christmas Eve. I had to report on the day after Boxing Day. We stayed at the Golden Cross Hotel, and I recollect how the bells of St. Martin's started ringing soon after our arrival dead tired, and kept us awake all night. We stayed there that I might be near Burges's office in Buckingham Street. Northumberland House was just about to be pulled down, and the lion's tail is firmly fixed in my memory.

"With one difference in the practice of English and American architects I was much struck. The system of employing the distinct professional class of 'quantity surveyor' is unknown in America. Is it dying out in England? His special work increases the period of construction, I imagine. In the American system the process of the quantity surveyor's estimate taking is eliminated, and when the plans are drawn and the contractor gives in his estimates, the architect himself 'takes off' and checks them. This adds greatly to the architect's responsibility, and he has often to employ experts, to whom he gives part of his own commission. Often, too, he is not an expert engineer, and must employ one fully qualified to deal with the great engineering problems that confront him. He is the supervisor, however, and nowadays must be familiar with modern requirements of sanitation, elevators, ironwork, fire-escapes and fire-prevention appliances, and many other necessaries of a building, so that the architect's commission does not cover all his requirements. Owing to the development of the tasks thrown upon the architect it is only reasonable that the owner should bear more of the expense in retaining expert advisers than has hitherto been the custom. As regards the engineering proper, the elevator system to be carried out in the up-to-date office building is of primary importance, the elevator and the telephone being rivals as chief factors in the demand for the speedy conduct of business. By the easy and ready working of the elevators is engendered confidence in the safety of the topmost storeys. In the Empire Building gathers daily a population of 8,000. For the Trinity Building we prepared ourselves to convey from 3,000 to 4,000 people to their desks in their offices, by installing eleven elevators each holding twenty-five people. By a system of local and express service the demands of

FAÇADE OF TRINITY BUILDING.

Digitized by Google

the 'rush hours' are provided for at the opening and close of the business day, when traffic is likely to be as congested as on Brooklyn Bridge. The round trip up and down takes two minutes and a half. Ten elevators are for passengers, one for freight. They are of the 'plunger' type, the cylinders being sunk to a depth of 300 feet. The main corridor of the building, with its gilded ceiling and great bronze doors, is one of the most interesting in New York. The Gothic elevator enclosures are an entirely new feature in commercial architecture, and is likely greatly to extend the application of the Gothic style to modern needs."

"And what are the chief precautions to insure the safety of the building's inmates against fire and other calamities?"

"The equipment to meet a sudden outbreak of fire is believed fully adequate to cope with any emergency. There is plenty of fire-extinguishing apparatus on each floor, and the precautions are so numerous that the danger is believed to be minimised. In any case there is not much to burn in the individual offices, and each can be easily isolated. The flooring is fireproof and the steel beams are embedded in cement. The windows and elevators are 'grilled,' so that the glass cannot fall out with a sudden heat, and this ought to give time for the firemen to come to the rescue."

Incidentally, it may be mentioned, the building is fitted with fireproof mahogany and impervious brickwork. There are 12,000 pulleys used in it. There is a complete clock system, all the clocks being synchronised electrically. Prompt despatch and receipt of letters is secured by the mail chutes which run from top to bottom, and the cleaning of the building and offices is effected by the vacuum sweeping process.

In the mass of detail relative to the Trinity Building, it would be easy to obscure the main characteristics of even such a gigantic building. I can only add that as the headquarters of some of the greatest financial and industrial concerns of the United States, numbering some seventy-five tenants for its 308 rooms, with a rental value of over 100,000*l.*, the rent for the floors above the first bringing in from 12*s.* to 14*s.* per square foot of floor space, the new Trinity Building carries on the traditions connected with its predecessor on the same spot as a focus of New York's business interests. Here was formerly the real estate auction-room of the city, and its offices were the centre of the wholesale coal trade. Now, as of old, Trinity Building is closely associated with Wall Street, down which looks Trinity Church, whose architect, as of the old Trinity Building, was Richard Upjohn, the foremost leader of his profession in his time, and whose shade may well still haunt the structure that has replaced his own city office and those of his brethren.

CATHEDRAL OF ST. MAGNUS, KIRKEBO.

A CORRESPONDENT of the *Scotsman*, writing from the British Consulate, Faeroe Islands, says:—

On the exterior of the east end wall of the ruins of St. Magnus Cathedral, Kirkebo, Faeroe Islands, is a carved and engraved stone representing the Crucifixion, with the Virgin Mary and Mary Magdalene on either side. Around the sculptured stone is a Latin inscription, much fractured. The legible portions, however, had been deciphered as—

> Hæc est habitatio harum sac...rum reliquiarum de ligno
> Domini de hostio ecce il (?) virgo Maria S.....e ossa
> Sti Magni mr..... de tumulo sti Thorlacii,

from which it had been surmised that "there had been deposited here holy relics of the true cross, the sacrificial lamb, the Virgin Mary, Mary Magdalene, bones of the martyr St. Magnus, and of St. Thorlacius." The last is an Icelandic saint.

A Danish architect, Mr. L. Koefoed-Jensen, had been deputed by his Government to carry out certain works of exploration and restoration at Kirkebo, and on June 9, 1905, he was to remove this stone to see whether the relics mentioned were still *in situ*. The Amtmand (Governor) kindly invited me to attend this most interesting operation. Accompanied each by some members of our family we left Thorshavn, the capital of the islands, early in the morning for a five-mile walk over the hills to the south-eastern extremity of the island, Stromo, where the ruins stand.

The name of the founder of Kirkebo Cathedral only became known in 1899, when a manuscript was discovered known since as "Archbishop Henrik Katteisen's Copy-book." He was Archbishop of Trondhjem A.D. 1452-8. In the section dealing with Kirkebo, from information supplied by the Faeroese bishop, Johannes, in the beginning of the fifteenth century, it is stated that Bishop Johannes had, with others, taken up from a grave in Kirkebo the bones of Erlend, who was bishop of the islands from 1268 to 1308, and had had them washed with a view to canonisation. In his grave was found a leaden tablet, with a Latin inscription in Runic characters, which states that Erlend more than his predecessors enriched the Faeroeses church with privileges, property and worldly goods; that during his time the church and bishop's see were damaged by incendiarism; that afterwards he began to make stone buildings, and laid the foundations of a stone cathedral and nearly finished the walls. But later on the bishop met with strong opposition from the Faeroese because he laid heavy taxes upon them for the building of the church and because he confiscated property.

After Bishop Erlend's death the cathedral was not continued, owing to the unwillingness of the islanders, and because shortly after this the "Black Death" nearly exterminated the population. In the same unfinished condition it still stands to-day in weather beaten beauty, a monument of unachieved ambition. The outside measurements of the cathedral are:—Length, 84 feet; breadth, 34 feet; height, 28 feet. The walls are about 5 feet thick. By the side is a sacristy 31 feet by 18 feet.

Slowly and carefully the stone was being loosened from its surrounding cement, pronounced by the architect to be the original, a circumstance which considerably raised our hopes of finding the relics said to have been deposited there 600 years ago. Tradition says that anyone attempting to remove the stone would meet with an accident; only one such attempt is recorded, and resulted years ago in a broken arm. While supervising work a few days before, the present architect had been struck by a falling stone, from which he was still deaf. If the relics were still so potent, surely they were still there. Finally the stone lay face downwards on a small cushioned scaffold prepared to receive it. We peered into the recess and saw nothing but solid masonry. The stone tablet itself, however, was 16 inches thick, and proved to be the sought for receptacle. Slightly raised in the centre of the inner side was a flat stone covering a hole in the tablet 3½ inches long, 3 inches broad and 2 inches deep. This hole was filled with a tightly pressed quantity of brown clay like mould, said to be unlike any local soil. Amid this lay a small oblong leaden casket, pressed into an irregular shape, no doubt to hold the contents immovable. The lid merely required lifting for removal, but this was deferred. In the middle it had been punctured, probably in the pressing, by a round blunt instrument. There was a fracture or cut also along one side of this leaden casket through which could be seen some mould inside the casket of the same kind as that which filled the hole in the stone. Wondering whether the relics still remained more or less in their former condition, for it now seemed certain that something had been deposited there, we followed the architect and Amtmand into the farmer's house, where the casket was to be opened.

This old house is now being searched, and is to be restored by the architect. It stands close to the ruins, and consists partly of a "block-house" two storeys high, one of the upper rooms of which is said to have been the bishop's library. The stone cellars and foundations were doubtless built by Bishop Erlend. They are 60 feet long, 38 feet broad and 9 feet high, with walls 5 feet thick, built of the same stone and in the same manner as the cathedral. In the cellar is a square stone enclosure, entered only by a trap-door in the floor of the room overhead. This is considered to have been a prison. This deep black hole was perhaps used to compel submission from recalcitrant taxpayers. The present occupier of these historic buildings is Mr. John Patturson, a member of the Danish Parliament, who enjoys hereditary rights as manager of the agricultural farm of Kirkebo for the Danish Government, to whom the ecclesiastical properties have passed. He takes a keen and intelligent interest in his surroundings. In the ancient days of the bishopric there was a college here for the education of the priests of the islands, and it apparently continued to be so occupied until the Reformation (1538). An "evangelical bishopric" (Lutheran) was established in 1540, but the first bishop, Jens Gregersen Riber, left the islands in 1557, since when there has only been a provost residing in them, under at first the Bishop of Bergen (Norway), but from the beginning of the seventeenth century under the Bishop of Sjaelland (Denmark). But the

Digitized by Google

provost does not nowadays reside at Kirkebo. The old church, however, built (in 1300 ?) before the cathedral was begun, has been restored, and still serves for Lutheran worship, the faith of the Faeroese. It is dedicated to the Virgin Mary, and is now the only church on the islands dating from the pre-Reformation period. On the shore are the foundations of an even older church. When the bishopric was abolished by Christian III. a "Latin school" was established in Thorshavn (first mentioned in 1547), in charge of the priest residing there, where a church was first built in 1609.

What a contrast a picture of the quiet removal of the lid of the casket by the Amtmand in this little room, with scarcely a dozen persons present, would present to one of the assembly 600 years ago of the half-heathen Vikings and their wild, warlike companions, to witness its entombment in the same stone, with all the impressive pomp of an ecclesiastical ceremony of the Roman Catholic Church. To-day scepticism as to the probability of finding interesting relics prevented a larger attendance.

Beneath the lid was found a small folded piece of hide, 4¾ inches long, 1 inch thick, with the sides sharply cut. Under this was a small packet, measuring less than 2 inches on each side, consisting of a material of a yellowish silky nature, tied in a knot in the centre and thus containing a smaller linen wrapped package. This piece of material when untied and spread out measured 19 inches by 4 inches. Under this wrapping, but outside of the smaller linen package, were found two distinctly separate small pieces of material: one of 1¼ inch long and ⅝ inch broad, with a green thread through it; within were two small splinters of wood; the other was a triangular piece of aded red material (resembling silk), 1 inch long and ½ inch broad, fastened by its own thread to an extremely narrow strip of cloth, which was 15 inches long. The inner linen-wrapped package next received attention, and was with the greatest care and caution, as, in fact, had been the case throughout, unfolded and untied, while an accurate record was being kept. Separately in one end, within a knot, was a small bone, or possibly two bones, lying in a brown, mould-like substance. But the centre of the linen strip had another knot, within which, when untied, were found seven small packages, to each one of which was attached a narrow strip of hide. One of these seven packages was opened, and contained a diminutive splint of wood. The others were left unopened. The piece of linen was 11¼ inches long and 6¾ inches broad, with a narrow seam on each side but not on the ends, which appear to have been partly cut and partly torn from the original piece of linen to which it had belonged. All that had been found within the stone, including the mould, was carefully packed and sealed. I understand they will probably be next submitted to experts for a thorough investigation, and, if possible, verification.

Some of the islanders, fearing they might lose their "treasure" if it left the country, begged that it might not be sent away. Their request was heeded, and the relics are again interred *in situ*, unexamined by any expert though writing could be traced on the parchments.

WEDNESBURY ELECTRICITY SUPPLY.

By F. J. WARDEN-STEVENS, A.M.I.E.E., &c.

THE Wednesbury Corporation obtained a provisional order in 1899, an agreement having been previously entered into with the Midland Electric Power Company.

In accordance with this agreement the Corporation did not oppose the company's application for a provisional order to supply within the borough, on the understanding that in the event of the Corporation also applying subsequently for a provisional order the company would not offer opposition, the objects of the Power Company being rather to supply in bulk to large consumers, such as mines, extensive engineering and other works rather than to distribute electricity in detail to private consumers. The arrangement now is that the Corporation supplies electricity in detail to all consumers in Wednesbury, the company supplying the Corporation only in bulk.

The electricity is generated on the two-phase system at a pressure of 7,000 volts at the Power Company's station at Ocker Hill. It is then transmitted to the company's sub-station in Wednesbury, where it is transformed down to a pressure of 2,700 volts and again to 200 volts.

The supply is delivered at the company's sub-station to the Corporation's "receiving mains" on the two-phase system at a pressure of 200 volts. The Corporation's sub-station contains transforming plant to convert from two-phase to continuous current. After conversion, continuous current is supplied by feeding mains laid from the Corporation's sub-station to five feeding points which supply the distributing network of mains laid in about 3½ miles of the principal streets. Thus the Corporation's mains are complete in themselves, and are so arranged that at any future date they may be supplied from separate works should that become advisable later, whereas the two-phase supply would not be economical from a separate plant owing to the nature of the borough and the demand in Wednesbury. It may here be mentioned that both the two-phase and continuous current systems of distribution were very carefully considered, and, after taking all circumstances into consideration, the latter was decided upon notwithstanding the additional expenditure necessitated by the transforming plant.

A portion of the Corporation's land has been utilised as the site of the sub-station. The buildings consist of the following:—Generator-room and switch gallery, accumulator-room, workshop, office, test-room and stores. The three last named are connected to the main building by a corridor. The buildings are arranged so that they may be easily extended; in the case of the office, &c., building, provision has been made so that another floor can be added at any time with little or no alteration. The contractor for the main and office, &c., buildings was Mr. F. J. Smith, of Wednesbury.

The transforming plant includes two motor-generators manufactured by the Phœnix Dynamo Manufacturing Company, Ltd., of Bradford. These each consist of a two-phase induction motor direct coupled to a continuous-current generator capable of delivering a current of 300 amperes at a pressure of 250 volts. There are two special pillars which contain the starting-gear; these pillars are fixed adjoining the machines.

The battery of accumulators consists of 117 cells, each capable of delivering 325 amperes for three hours. The containing cases are constructed entirely of lead, the crate being in the form of an antimony ⊥ section frame burnt together and lined with 6 lbs. sheet lead at sides and 10 lbs. lead at bottom, and supported on a slate base. Each cell has twenty-seven plates, the positive plates being of the Planté type and the negative of the pasted type. The cells have been supplied and erected on heavy pitch-pine stands by the British Accumulator Company, Ltd., of Westminster.

There is a charge and discharge booster of the Highfield type manufactured by the British Westinghouse Company, Ltd. The booster dynamo is capable of a maximum back boost of 75 volts during charging of the battery, and is capable of keeping the pressure practically constant on charge or discharge automatically within a limit of 30 volts difference of battery and line voltage, under all conditions of load (up to 325 amperes) and battery voltage.

The exciter is direct coupled to the booster, and the machine may be driven by either a continuous-current motor of 30 h. p. or a two-phase motor of similar size. The continuous-current motor is connected to the booster through a clutch, and the two-phase motor is similarly connected to the continuous-current machine. These clutches enable the following arrangements of use:—(1) Two-phase motor driving continuous-current machine as a dynamo-booster disconnected; (2) two-phase machine driving booster through continuous-current shaft, the latter idle; (3) the same as (2), but continuous-current machine, being run as a generator as well; and (4) continuous-current machine only driving booster.

In addition a portable "milking" booster has been provided, consisting of a 200-volt two-phase motor coupled direct to a shunt dynamo capable of delivering 150 amperes at 6 volts. This plant is mounted on a truck for convenience in moving about the accumulator-room, to enable one or two cells to be charged as required.

The switchboard, which consists almost entirely of metal and marble, is arranged in a "bay" form, the central portion being reserved for the two-phase feeder gear and the continuous-current main ammeter, voltmeter and timepiece. On the left side of the bay the continuous-current feeder panels are fixed, and on the right the machine panels.

The switch gallery is raised about 1 foot from the floor level, and contains also the starting pillar of the booster. Behind the switchboard ample space has been allowed, which forms practically a separate small room, and contains,

Digitized by Google

in addition to the switchboard connections, the main two-phase meters and the main continuous-current meter. The switchboard is arranged to control the following:—Duplicate two-phase "receiving" mains, three motors (two main and one booster), a spare panel being allowed for an additional machine, five continuous-current feeding cables, and two spare feeder panels, two main dynamos and two boosters on the continuous-current side, one spare panel being allowed for each. A system of subways leads from the switchboard to the machines, battery, &c., and to the street, for conveying the connecting cables. The switchboard was manufactured and erected by Mr. W. Sanders, of Wednesbury, the instruments being of the permanent magnet edgewise and sector types, and mostly by Nalder Bros. & Thompson.

The mains consist of two-phase twin concentric .3, .3 and .45 square inch lead-covered "receiving" cables (connecting the Corporation's sub-station with the Power Company's sub-station), concentric lead-covered continuous-current feeding cables, and single lead-covered cables for distributing mains. The distribution is carried out on the two-wire system, the pressure of supply being 230 volts. All cables are laid on the solid system, being supported on wooden bridges in wooden troughs, filled in solid with bitumen and protected by hard-burnt tiles. Generally where there are tramway lines and in important streets the distributing mains are laid on both sides of the roadway under the footpaths, but in the less important streets on one side of the road only. The cables were manufactured and laid by Messrs. W. T. Glover & Co., Ltd., and are of their well-known diatrine paper insulated type.

The contract for meters, &c., was divided, the electrolytic and motor meters, maximum-demand indicators, as well as the house service fuses and fuse-boards having been supplied by the Reason Manufacturing Co., Ltd., and the prepayment meters by the British Thomson-Houston Co.

The charges for the supply are as follows:—Lighting, 6*d.* and 2*d.* per unit on the maximum demand (one hour) system; power, 3*d.* and 1½*d.* per unit, or a flat rate of 1½*d.* per unit in the daytime and 3*d.* during lighting hours.

An important point in connection with a distribution undertaking such as this is that there is no risk of excessive cost of production in the early years. The charge for electric power in bulk to the Corporation is 3*d.* for the first hour of maximum demand for each day and .825*d.* per unit for all further supply. The losses as regards inefficiency of transformation and losses in mains appear principally in units at the lower charge, and the losses in the accumulators are entirely low-rate units. The supply of electricity to each individual consumer is on the maximum-demand system, yet, owing to the diversity of the time of the maximum load, the total maximum load of the Corporation is less than the sum of each individual consumer's maximum demand during each quarter. Further, as the accumulators reduce the Corporation's maximum demand on the Power Company, the load is more even; or, in other words, under the system of working, if the maximum load on the Corporation's sub-station is, say, 150 kilowatts, the demand by the Corporation on the company need only be 75 kilowatts, so again there is a large transfer of units from the 3*d.* to the .825*d.* rate, and the units lost in the battery are entirely at the low rate as before mentioned. Further, in an undertaking of this nature the increase in the Corporation's capital charges as the load increases will not be heavy.

A few figures as to the results of eighteen months' working may be of interest. The consumers number about ninety, and the connections have reached the equivalent of 5,258 8 c.p. lamps, including 28 h.p. in motors; also 596 lamps of 8 c.p. equivalent have been applied for in addition, but have not so far been connected. Various extensions of the mains have been carried out by the staff to cope with the demand which has arisen.

A noticeable point has been the even pressure which has been maintained, rendering the use of Nernst lamps very satisfactory. It would not otherwise have been possible to compete successfully with incandescent gas-lighting in the borough.

The technical negotiations with the Power Company were carried out by Mr. F. J. Warden-Stevens, A.M.I.M.E., A.M.I.E.E., of Westminster, who has acted as consulting engineer to the Corporation, and under his supervision the undertaking has been completed and operated. Mr. W. Fennell acted as assistant to the consulting engineer and Mr. T. H. M. Swinburne as clerk of works. The undertaking has been carried on for eighteen months under the instructions of the consulting engineer, and the position of resident engineer is held by Mr. W. Fennell.

It is to be noted that electricity has been introduced into the following public buildings: Town hall, municipal offices, art gallery, public library and public baths, the arrangements having been planned and the work supervised by the consulting engineer.

THE COLONIES AND COLONIAL ARCHITECTURE.

IF any apology were needed for making reference to the above subject at the present time, it would be found in the desire shown by the people of this country for a closer union with the inhabitants of the various Colonies, and which it is to be hoped the latter will reciprocate. Then, again, it may be urged that there is some justification for treating the subject, in view of the expectation that trade with the Colonies, or at least some of them, is likely to be increased at no distant period, with mutual advantage to all concerned.

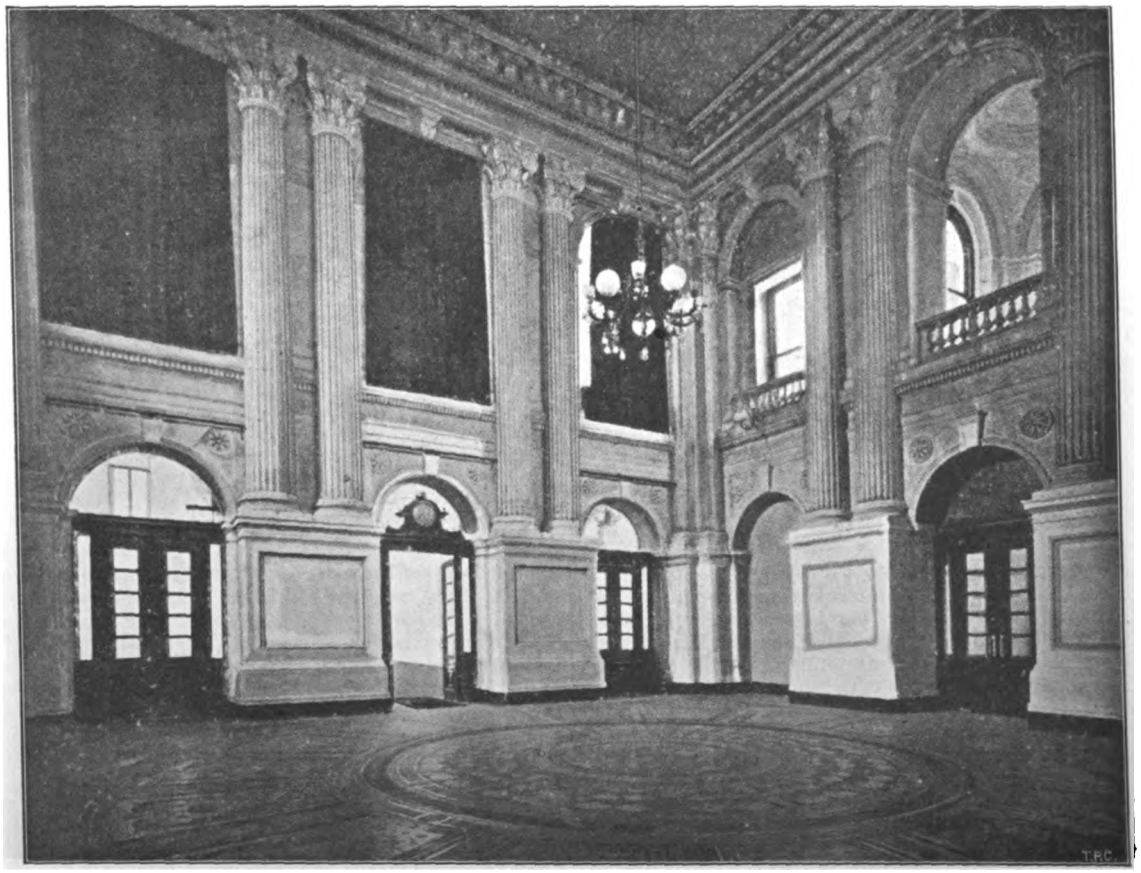
In the limited space at our disposal it would be impossible to give anything like a survey of the whole of our Colonies, or enter into wearisome statistics of their imports and exports, nor is there any necessity for so doing, inasmuch as there are other sources of information which are available for those who desire to be thoroughly posted in the subject. Nevertheless, we have deemed it fit and expedient to give a cursory glance at the principal portions, and to illustrate a few of the typical buildings, in order to show that in colonial towns architecture is not neglected.

THE AUSTRALIAN COMMONWEALTH.

The Commonwealth of Australia, or the confederation of the six original States of New South Wales, Victoria, Queensland, South Australia, Tasmania and Western Australia—with which we propose first of all to briefly deal—has an area, it is estimated, of 2,972,575 square miles, and the population is about 4,000,000. The capitals, as is well known, are Melbourne, Sydney, Adelaide, Brisbane, Perth and Hobart. The township of Dalgety, New South Wales, however, is likely to be adopted as the site for the capital of the Commonwealth, but meanwhile the seat of Government remains at Melbourne.

VICTORIA.

This colony, although the smallest, is one of the most prosperous of the various colonies situated in the Australian continent, of which it occupies the south eastern portion. Well-favoured as it is in regard to the primary sources of production, the State has also for a number of years taken a lead in the direction of its manufactures. The policy of successive Governments during nearly half a century has been to foster manufacturing enterprise, and the result is that Victoria presents a remarkable instance of industrial progress for such a young country.



Melbourne is regarded as a beautiful capital, and it is also the most populous and important city in the southern hemisphere. It is laid out with wide and regular streets, and is well paved and lighted. Many of the buildings possess architectural merit. The cathedrals and churches, schools, Parliament House, Treasury, town hall, post office, law courts, Custom house, university, museum, free library, national gallery, clubs, theatres, and other public institutions are worthy of admiration.

The most important building in the city is the fine group of the Houses of Parliament. In November 1881 we were enabled to publish the original drawings. Mr. Peter Kerr, the architect, who happily is still active although he has retired from practice, is a native of Aberdeen. He was born in that city in 1820, and became a pupil of Archibald Simpson, who enjoyed a considerable practice. Then he acted as an assistant to George Fowler Jones. He afterwards joined the staff of Sir Charles Barry and prepared some of the working drawings of the Houses of Parliament. One of Barry's principal clients was the Duke of Sutherland, and Mr. Kerr superintended works at Cliveden, Dunrobin Castle and Trentham—the last being the mansion which the present duke has made over to Staffordshire for an industrial college. Mr. Kerr emigrated to Australia in 1852, and became a member of the firm of Messrs. Knight, Kemp & Kerr, architects, of Melbourne. When designs for the Houses of Parliament were sought in competition the firm's design was successful. For over half a century Mr. Kerr has been connected with the legislative palace. He was appointed sole architect by a commission in 1877. In the

course of so long a period several alterations have been made and the building may now be considered as an architectural triumph.

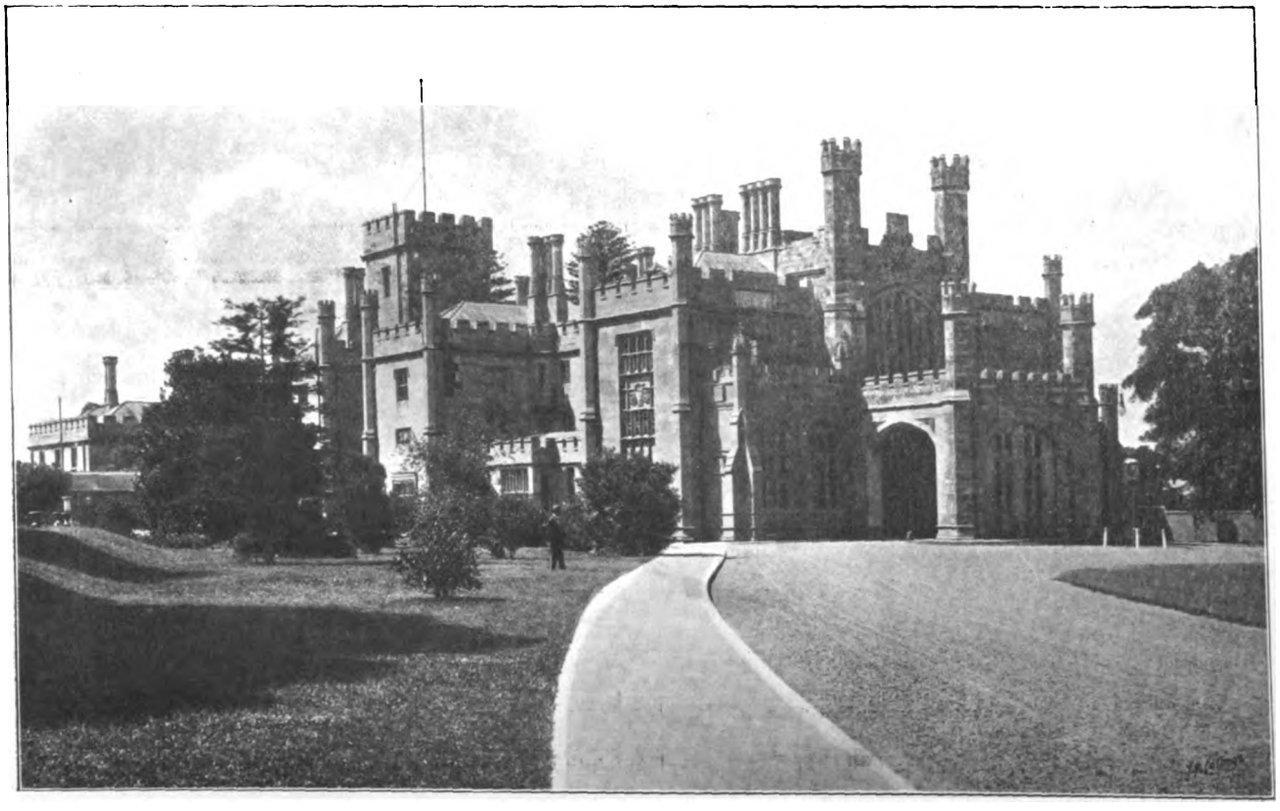
It will be seen that a Classic treatment was adopted, and indeed, no other was to be expected from a Scottish architect who had worked under Barry. The plan is compact. Roman Doric is used for the substructure. The four façades have fluted columns and pilasters, plain moulded bases and moulded and enriched capitals, standing on panelled and moulded pedestals 4 feet 6 inches high, with plinths and caps and balustrades between, crowned with mutular entablature, having triglyphs and enriched metopes; the windows in the first range have alternately raised rusticated piers, with plinths and caps, enriched archivolts and

MELBOURNE HOUSES OF PARLIAMENT—COLONNADE.

rusticated vermiculated voussoirs, the key voussoir of each supporting an enriched semi-projecting bottom, which sustains the balconettes of the upper windows. The windows in the second range have square heads, with pilasters, architraves, trusses and mutular entablatures, and balconettes having pedestals with plinths and caps, and, segmental on plan, balustrades.

Generally the west façade, facing Spring Street, consists of a grand portico with wings on each side, the projecting centre inter-columniations having grouped columns and pilasters. The architectural features of the rear façades, or east front, and the north and south façades are similar to those of the west, except that they have colonnades on the principal floor, recessed from the general face line of the building, with balconies over.

One important feature of the building, *i.e.* the dome, has yet to be erected, and wanting it the structure, as a composition, is necessarily incomplete. The massive columns in the entrance vestibule may now seem to be excessive in dimensions, for the height of the ceiling is no more than 45 feet. When the tower and dome are built, however, the interior will be about 140 feet high, and the vestibule columns will then be in proportion to the parts above it. The illustrations are taken from the Journal of the Royal Victorian Institute of Architects and were photographed by Mr. J. H. Harvey, architect.



Ballarat, the second city in the colony, aptly bears the title of the Golden City, and Anthony Trollope said with justice of it that it struck him with more surprise than any city in Australia, that "in point of architectural excellence and general civilised city comfort, it is certainly the metropolis of the Australian goldfields." The principal buildings are the city hall, post office, Mechanics' Institute, banks, theatre, hospital and several large churches. Costly memorials are to be seen of Robert Burns, Bourke, Wills, Thomas Moore and Her late Majesty the Queen. At the Botanical Gardens there is a fine collection of Carrara marble statuary, including the "Flight from Pompeii." Ballarat, in fact, is noted for its sculpture, as well as for its pictures and other art treasures.

Geelong ranks fourth among the cities of Victoria, and is picturesquely situated on Corio Bay. The public institutions are numerous, and include the Geelong College. The Geelong Free Library and Museum is located in a handsome building, originally built by the Chamber of Commerce at a cost of 11,000*l*. Bendigo is a little over 100 miles from

Melbourne, and the most prominent buildings are the post office, the masonic hall, the town hall and hospital, together with a very fine theatre.

The hard woods of Victoria are becoming known beyond Australia, and for wood paving or heavy constructive works, where durability in water or wet ground is required, they cannot, it is claimed, be surpassed. For wood paving, the red gum, blue gum, iron bark, box and grey gum are of the highest value and importance. In the city of Melbourne all the woods named have been in use in the main streets and have given satisfaction. For railway sleepers these

woods have also stood all tests. In addition there are other eucalypts well adapted for cabinetwork and commercial purposes.

NEW SOUTH WALES.

The total area of this colony is estimated at 310,700 square miles, or a little over two and a half times the size of Great Britain and Ireland, while its length from Point Danger on the north to Cape Howe on the south is 680 miles, and its breadth from east to west is 760 miles. Sydney, the chief city and capital, stands on the shore of Port Jackson, surrounded by fine scenery. Among the noticeable public buildings is the General Post Office, which is mainly built of Hawkesbury sandstone; the great pillars supporting the long colonnade are of polished granite. From the centre rises a clock-tower, the loftiest in Sydney. Then there are the massive buildings of the Victoria markets, 610 feet long by 100 feet wide. Standing side by side are the town hall and Anglican cathedral. The style of architecture of the town hall is sometimes regarded as too florid. Its principal chamber has seating accommodation for at least 5,000 people. The cathedral is, of course, a Gothic structure. At the intersection of Bridge Street is the Exchange, which is another example of the use of that sandstone to which the architectural beauty of the city owes so much. From Hunter Street to King Street there is a range of lofty buildings, one of the most effective being the offices of the Mutual Insurance of New York, which, like the Equitable Life Insurance buildings in George Street, testify to the suitability of the native syenite for grand architectural effect. Then there is the building erected for the Lands Department, while further along are the offices of the

Digitized by Google

Colonial Secretary and the Minister for Public Works, besides the Treasury. Among other important buildings may be mentioned St. Mary's Cathedral, which is regarded as the noblest specimen of ecclesiastical architecture in Sydney. The residence of the Governor-General is described as of the Elizabethan or Tudor period, of fair elevation (being 41 feet high), and surmounted by a number of turrets and tall chimneys. A lofty portico gives access to the front. The halls and state rooms are spacious, and are suitably decorated.

New South Wales is rich in timber. An authority expresses the opinion that it is one of the most richly endowed countries in the world, and the report of the Royal Commission on Forestry in Victoria, which includes an account of the forestry resources of other States of Australia, states:—"While the forest area of Western Australia greatly exceeds that of New South Wales, the latter probably possesses a greater variety of trees of commercial value than any other State of the group." It is estimated that the forest area of New South Wales comprises 20,000,000 acres, of which up to the present 7,503,200 acres have been reserved for forestry purposes.

QUEENSLAND.

A country of vast extent, thoroughly explored, but only sufficiently developed to reveal the immensity of its latent resources, is an interesting study. Queensland has arrived at that stage, and, viewing what has already been accomplished by one of the youngest of the British Colonies, some are sanguine enough to believe in its ultimately outstripping all the rest in material prosperity. In every direction we gather that there are signs of activity and progress. Looking, for instance, at the miles of streets in Brisbane, the gardens and recreation grounds, the churches, hotels and public buildings, it is difficult indeed to realise that the single life of many an individual spans the interval between a primeval condition and the present scene of bustling interest. Nor are evidences wanting that the refinements of life have not been neglected in the race for wealth, as witness the pretty homes that dot the suburbs, with all their amenities. A noble bridge spans the river and bars the further advance of ocean vessels, although small steamers follow the winding reaches for 40 miles further to the town of Ipswich.

Unlike the southern States of New South Wales and Victoria, whose commerce passes almost exclusively through a single port, Queensland's coast line of 2,500 miles presents a number of harbours which have become the sites of important towns. Going north from Brisbane, the most important ports of call are Maryborough, with its timber, saw-milling and foundry industries; Bundaberg, whose prosperity is largely due to the sugar production of its neighbourhood; Gladstone, with its meat-preserving works, the outlet, too, of numerous small goldfields; Rockhampton, the principal port of Central Queensland; Mackay; Bowen, with its beautiful harbour; Townsville, the leading port of North Queensland; and further north, Ingham, Cardwell, Cairns, Port Douglas and Cooktown.

The area of Queensland is 668,497 square miles, and but little over half a million of people occupy this vast territory. Although the inhabitants are comparatively few in numbers, it is admitted that they have made a splendid record.

THE UNITED SERVICE CLUB.

THERE is so much severity about the exterior of the United Service Club, which Thackeray called the "Martium," it is not generally recognised that John Nash was the designer. It was opened in 1828, and was one of several which were erected about the same time. The Athenæum, by Decimus Burton, formed the pendant to it, and Barry soon afterwards erected the Travellers' Clubhouse and the Reform Club. Owing, we suppose, to official regulations there was a general agreement between them. Two storeys and a basement were reckoned to be sufficient. Land at the time was far less expensive than it is at present, and the clubhouses were able to be extended to a great depth. In the United Service Club the principal rooms are lighted by windows on the western side. At one time it was considered that Nash had produced the most commodious club in London.

It would be strange, however, if a building, which is so closely connected with the Army and the Navy, did not reveal shortcomings when compared with later buildings of the same class. Just as in the Services there was indifference to reform, the clubhouse until recently caused inconvenience to the members, but which they were unwilling to remedy. At last changes could not be avoided, and the commission to improve the building was given to Messrs. Isaacs & Florence. Under their direction works have been executed by Messrs. Aldin, Bros. & Davies, of South Kensington, the contract amount being 15,000*l.*, but which will probably be exceeded. As every architect and builder is aware, the carrying out of work in such a building as a clubhouse is necessarily costly. The entire premises cannot be surrendered at once. The men have often to work in closets and small rooms where their action is restrained. Care has to be taken too to avoid injury to whatever is permitted to remain, and that is another obstacle to freedom of action. The whole of the work has in this instance been performed in a manner which must be deemed creditable to all concerned in it.

When the Pall Mall clubhouses were erected, it was considered indispensable to introduce an imposing staircase. That for the United Service Club is not visible from Pall Mall. It is characteristic of the members that it has to be approached by an indirect route, where strangers can be challenged and prevented from further advance, if necessary. On reaching it the inner hall is found to be capacious. If Nash had employed a more massive balustrading instead of light rails the appearance would be enhanced. The architects by improving the lighting have increased its interest and utility. A great lantern has been constructed, with window openings at the sides. The ceiling is decorated in delicate colours with graceful ornament. It is not often that so much architectural treatment is to be found in connection with upper lights. All walls have been painted in subdued colours. In the rooms, as well as the staircase, quiet tones have been adopted. This is peculiarly advantageous in the United Service Club. There are a great many paintings —although not always originals—of full-length figures of British officers, which give character to the building by expressing its connection with the Services. These paintings gain by the contrast offered between the brilliant colours and the quiet surface of the wall, the latter furthermore affording a desirable repose to the eye. Some additions were made to the club in 1859, and it is now difficult to increase the size. The architects have contrived to add to the dimensions of the smoking-room, which will be appreciated by the members who congregate there.

The basement has been completely transformed. In the early Pall Mall clubhouses the lower part was thought to be a part which it was wise to exclude from view, and for that purpose a massive wall was erected. The basement in the United Service Club is not revealed to the public gaze, but it is no longer a dark region. Light has been obtained by means of an inner court. The walls are glazed with tiles by Messrs. Doulton & Co., which are of a light and soft yellow colour, with the result that the lower part of the building is as well illuminated as any of the great rooms. No part of the works will cause as much surprise to the members as those in the basement. A large portion has been arranged as lavatories, dressing and bedrooms, with the latest appliances of Messrs. George Jennings, Ltd. The kitchen and domestic offices have been altered and improved, and the heating and cooking apparatus of Messrs. J. Slater introduced. What will prove a great convenience is the electric passenger lift from the basement to the first floor, which has been supplied by the Otis Elevator Company. In connection with the kitchen is a buffet in the coffee-room formed in a recess, and therefore not diminishing in any way the original area. A new drainage system has been introduced under the direction of Messrs. Shone & Ault.

The works were carried out for Messrs. Aldin Bros. & Davies under the supervision of Mr. Leslie Shingleton, their manager, with Mr. Robinson as general foreman. Mr. Sutton, as clerk of works, has watched the interests of the United Service Club.

TESSERÆ.

Mediæval Shrines.

IN Mediæval periods the shrines of saints were sometimes monumental structures, standing detached and complete in themselves, and sometimes they were enclosed within or actually formed the body of the altars—often the splendid high altar of the church built in honour of the saintly personage. Very few examples of either kind of these shrines have come down to us in their original unaltered state. The influx of wealth from devout worshippers, and the never-ceasing desire to do greater honour to the saint, in nine cases out of ten caused the primitive structures

Digitized by Google

to be remodelled, added to and embellished, or even reconstructed from age to age, on scales of ever-increasing magnificence. Thus the earlier or primitive receptacles provided for the remains were more often than not, in the long run, discarded. Stone and marble were replaced by bronze, silver and gold, florid metalwork, marble inlays, mosaics, gems and enamels. In this country we have two ancient detached shrines of great archæological interest, viz. King Edward the Confessor's shrine in Westminster Abbey and the shrine of St. Amphibalus at St. Albans. Of the one paramount structure of this kind which once adorned this country, the shrine of St. Thomas at Canterbury, the wonderful description is all that remains to us.

Colour Decoration.

It has been argued that there are two schools of colourists. First, that of harmonious contrast; second, that of melodious intervals; but melody appears to be the proper manner of arranging harmonious colours, in the same way that harmonious notes are uninteresting till a melody is composed. Melody in one colour is to some extent similar to playing on one note. This being the case, how is it that so many apparently inharmonious compositions have been successful? There are many reasons, mostly unrecognised or unthought of. Many rooms have been decorated entirely in dull greens or blue greens, but contiguous rooms may be in hues of yellows and browns, consequently the two apartments together would be harmonious, separately, melodious; indeed, our colour appreciation would be momentarily increased on passing from one room to the other. Then furniture and art objects generally bring in some contrasting colours. The chief cause, however, is due to the low key in which the large surfaces were coloured, the actual amount of pure colour being very small, the greater portion being grey, in which the three primaries are present in harmonious proportion. It is seldom, perhaps never, that the three primary colours are absent in decoration, taken as a whole, and including carpets, furniture, everything. All in the room, and all that can be viewed out of the room, must be taken account of, as also the amount of light received into it and the colour of that light. A room decorated in melodious tones of reds, in which no opposite colours were permitted, having a large window looking out upon a green lawn, might be strictly harmonious in daylight, though at night, when the green was shut out, the impression would doubtless be hot and oppressive.

GENERAL.

The King of Spain has conferred the Commandership of the Royal Order of Isabella the Catholic upon Mr. William Rome, F.S.A., of Creeksea Place, Essex. Mr. Rome was chairman of the committee which organised the exhibition of Spanish art held at the Guildhall in 1901.

A Committee of American architects has been formed to report on a national school of architecture. The chairman is Mr. Walter Cook, and among the members are Professor Des Pradelles, Mr. Trowbridge, Mr. Carrere, Mr. Lloyd Warren and Mr. Whitney Warren.

The Sculpture Galleries in Aberdeen, which were opened in April last, have been visited by about 300,000 people up to November 30. The expenditure has exceeded the income by 452*l.*

An Effort is being made in Edinburgh to raise 1,500*l.* to pay for a cast in bronze of the "Physical Energy" of the late G. F. Watts and erect it in a prominent position in the city.

Lord Iveagh has disposed of to the Government, on favourable terms, the lands on the north side of the river Liffey near Dublin, known as the Long Meadows. The acquirement was arranged in order to preserve the view from Phœnix Park.

Mr. H. O. Wills has presented to Bristol "The Guards' Cheer," by Professor Herkomer, now on loan at the Bristol Art Gallery.

The Watts Exhibition was opened in the gallery of the Royal Hibernian Academy, Dublin, on Monday, by Lord Drogheda. It will be kept open for at least one month.

Mr. Harrison Weir, who was the Landseer of illustrated literature, died on Wednesday night at his residence, Poplar Hall, Appledore, Kent, in his eighty-first year.

Mr. George Clausen will begin his lectures at the Royal Academy on Monday next. Mr. T. G. Jackson's course on "Reason in Architecture" will commence on February 5.

An Exhibition of pictures by the Glasgow school has been held at Buffalo, U.S.A. Twenty five of the seventy-seven exhibits which were for sale found buyers. Seven were bought in for the permanent collection of the Fine Arts Academy.

The Late Mr. H. C. Richards, K.C., M.P., bequeathed a sum of 5,000*l.* to the Dean and Chapter of St. Paul's for rebuilding and sustentation of St. Paul's Cross.

The Will of Mr. Henry Hugh Armstead, R.A., the sculptor, has been proved at 14,602*l.*

Mr. F. Simmonds, deputy-surveyor of Windsor parks and woods, for nearly thirty years' service has been decorated by the King with the Fourth Class of the Royal Victorian Order on his retirement. Prince Christian handed him the Order at Cumberland Lodge before a large gathering, and also presented him with a cheque for 500*l.*, and an illuminated address from the residents on the royal estate.

The Building and Sites Sub-Committee of the Farnworth education authority have invited Messrs. Brown & Dutch (Manchester), Messrs. Henderson & Brown (Bolton), Messrs. Ormrod & Pomeroy (Bolton), and Mr. J. T. Proffitt (Farnworth) to submit sketch plans for a new school in Plodder Lane to accommodate six hundred children. The school is to be built in two storeys, on the central hall system, and to be of Accrington brick on the outside, and, whilst being complete, to be so planned as to admit of future extension providing increased accommodation.

The Quantity Surveyors' Association. The adjourned discussion upon Mr. F. B. Hollis's paper, "Some Thoughts on the Quantity Surveyor, and his Relation to the Building Owner, the Architect and the Builder," will take place on Wednesday, January 17, at the "Chinese Room," Holborn Restaurant, at 7 P.M.

The Exhibition of the International Society of Sculptors, Painters and Gravers opens in the New Gallery, Regent Street, on January 8. The president, M. Rodin, will exhibit his "Le Baiser" and a smaller work, "Paolo and Francesca." M. Bartholomé sends an heroic Adam and Eve. The executors of the late Constantin Meunier, the Belgian sculptor, who was an honorary member of the Society, send some twenty works, including his series of reliefs and figures glorifying labour; and Mr. Paul Bartlett, the American sculptor, will contribute a large group of his bronzes.

The Manchester Incorporated Law Association propose to forward to the Lord Chancellor a memorial as to the Manchester and Salford County Court. They ask:—That the County Courts of Lancashire holden at Manchester and Salford may be combined and become one court. That new County Court buildings suitable for the requirements of the combined courts may be erected upon the site of the existing County Court of Manchester in Quay Street, Manchester, or upon some other suitable site equally convenient to Manchester and Salford. That the existing County Court buildings in Encombe Place, Salford, which are wholly unsuitable for the purposes of a County Court, may cease to be used for that purpose.

An International Exhibition of Photography will be held in Paris in July at the Grand Palais des Beaux-Arts.

The Egyptian Gallery at the British Museum is in process of rearrangement. It is believed that a sectional catalogue dealing with this gallery is in course of production.

Mr. W. H. R. Crabtree, borough surveyor of Doncaster, died last week at the age of forty-eight. He was the son of Mr. William Crabtree, for many years borough surveyor of Southport, and was brought up in his father's office. In 1879 he became connected with the late Mr. Mansergh, and under his direction helped to carry out many important works, including sewerage and water schemes at Sherburn, Bethesda and Withington, and the Rotherham waterworks. Seventeen years ago he was appointed borough surveyor of Doncaster, and has carried out many important undertakings. A few days before his death he had completed plans for carrying out three important schemes—the erection of schools in Chequer Lane, of a higher municipal school and a model lodging-house, involving an expenditure of over 50,000*l.*

The Essex County Council on Tuesday approved of the purchase of a site at Colchester, to cost 10,650*l.*, for the erection of a lunatic asylum.

The Architect of "Courtbrac," published on the 22nd ult., is Mr. W. B. Stonebridge.

The Architect.

THE WEEK.

MEMBERS of the Architectural Association will no doubt be pleased at the election of Mr. F. W. POMEROY as an Associate of the Royal Academy on Monday. He was the teacher of modelling, and although only a limited number of students joined his class, that was not owing to any indifference on his part. He is one of the products of the Lambeth School of Art, which might be considered as a nursery for Royal Academicians. He gained the Gold Medal and Travelling Studentship of the Academy twenty years ago, and he has been fortunate in obtaining commissions for statues for public places. His *Nymph of Loch Awe* was purchased out of the Chantrey Fund. Mr. EDWARD STOTT, the painter, has during the last dozen years lived at Amberley, in Sussex, and his paintings of the district and its inhabitants have secured for him a distinct position among painters. He studied in Paris, and traces of French influence will be observed in his work. Engraving has not of late years received its due recognition in the Academy, and there is no doubt this indifference has had a depressing effect upon the art. It is, therefore, satisfactory to find that Mr. FRANK SHORT has been elected an Associate-engraver. He has adopted a wide range, and in each variety he has succeeded. His plates have been more appreciated abroad than in this country. Mr. WILLIAM STRANG, who was likewise successful at the election on Monday, is known as an inventive and powerful etcher. He is indifferent to prettiness, but his portraits are among the best of their class, and will bear comparison with those of VANDYKE. Mr. S. J. SOLOMON, whose paintings are usually among the attractions of Academy exhibitions, although sometimes in unsuitable positions, has attained the rank of Academician, a distinction which is well deserved. The election of JOSEF ISRAELS as an Honorary Foreign Academician has been too long delayed, and cannot give much pleasure to so old an artist. Many Dutch painters have represented humble life before him, but none of them with so much sympathy and reverence. The work of Mr. SAINT-GAUDENS, the other foreign member, is much admired in America, yet his preference to M. RODIN is difficult to understand.

IT is not wise to suggest to Frenchmen that the law of change not only operates on all things, but now works with unprecedented activity. Statues when once erected were accepted as immobile. Their inauguration was therefore always an important affair, for something was being set up which was believed to be enduring. In modern times a different practice has been followed. After a great deal of diplomacy between committees and authorities, a site is obtained in a public place, a pedestal is constructed, a statue is placed on it, a crowd of people assemble, orations are delivered and there is mutual congratulation. But if somebody who is interested in the subject could not attend the ceremony which was described at great length in the newspapers should go to the place a few days afterwards in order to gaze on the memorial, he is likely to find neither pedestal nor statue. Adverse critics explain on such an occasion that the statue was ashamed of the exposure and ran away. A statue of poor CAMILLE DESMOULINS, the Revolutionary journalist, was recently placed in the garden of the Palais Royal, where he used to harangue the people. On the day following the inauguration there was no sign of it. Another instance was the memorial of GEORGE SAND in the garden of the Luxembourg. A stranger may now in vain seek it. It appears that the reason given in several cases is that what was erected was incomplete. But then the question arises, Why should so much fuss be made over a plaster cast? Apparently it is supposed that the assembling of a crowd, speeches from notabilities, journalistic descriptions and illustrations help to increase the funds, which at the time are insufficient to pay for the block of marble or the casting in bronze. Parisians must, however, in time grow tired of such a system.

IT is difficult at the present time to believe that art ever received countenance in Russia. But the life of LEO LAGORIO who lately died reveals that artistic talent of that kind receives encouragement. He was born in 1826, and in his youth attracted attention by the drawings he made at school. The Governor of the State felt it was his duty to bring him to St. Petersburg, where he was immediately received into the Imperial Academy of Art. He gained annually medals and other rewards, and in 1852 was awarded the great gold medal. That entitled him to travel at the expense of the Government beyond the limits of Russia. Naturally his goal was Italy, but as a landscapist he was eager to visit the wild scenery of the Caucasus before proceeding to the south. He was enabled to remain eight years in Italy. Then he returned to the Caucasus and witnessed some of the contests which took place in the discontented districts. Afterwards he set up his studio at St. Petersburg. He was able to visit from time to time various parts of Eastern Europe and Asia, and he received numerous official commissions. His paintings of scenes in the Crimea and on the shore of the Black Sea were considered to be most successful. Of late years he suffered from weakness and could only paint with difficulty.

THE fate of the "Auld Brig" at Ayr seems to be as far from settlement as ever. It will be remembered that the Town Council could obtain a bequest of 10,000*l.* for the rebuilding of the bridge. After a long inquiry restoration was preferred to rebuilding. But in December 1903 counsel expressed the opinion "that under no circumstances can the bequest be used for mere repairs. Rebuilding, which may be in whole or in part, is, we believe, the only object to which the memorialists are entitled to apply the bequest." The Council simply resolved to take down the bridge, to mark all the stones and to rebuild it, using as many of the old stones as was possible. There was a movement against that proposal, for it was considered that the bridge could be preserved without demolition and rebuilding. A committee of gentlemen who took interest in the structure proposed that there should be some compromise with the heirs-at-law of Mr. TEMPLETON who made the bequest. Counsel were again consulted, and their opinion was considered at a meeting on Monday last. They recommended that a private Bill should be introduced to obtain power to enter into such a compromise, as a more preferable course to petitioning the Scottish courts for the desired authority. The Council are divided about the advantage of the proposal, and it was decided to hold a conference between the works committee and representatives of the advocates for the preservation of the ancient bridge. For a time at least subscriptions towards the expenses are not to be sought, and the bequest cannot be utilised without a special Act. The reparation of the "Auld Brig" is therefore a question for the future rather than for the present year.

THE record of the meetings and excursions of the Upper Norwood Athenæum during 1905 has been published under the editorship of Mr. T. PITT, F.C.S. The majority of the papers relate to places in the vicinity of London, and there is no exhausting their interest; but the members have ventured further afield, for Stratford-on-Avon is fully described. The volumes form a valuable series, and contain the pith of many larger works. The Society is conducted on economical principles, for the annual subscription is only 10*s.* 6*d.*, with an entrance fee of the same amount. Pleasant and intellectual entertainment is insured in return.

Digitized by Google

THE CHARING CROSS ROOF.

AFTER a short deliberation on Monday the coroner's jury, who were inquiring into the cause of the catastrophe at Charing Cross, through which six men were killed on December 5, brought in the following verdict:—"We find that the cause of death was accidental; that the cause of the accident was the breaking of a tie-rod through an unforeseen flaw, and attach no blame to the company's officials. The jury wish to express great sympathy with all concerned in this calamity." No other conclusion could be come to after hearing the evidence of the engineers and other witnesses. The "unforeseen flaw" probably dated from the time when the material used in the tie-rod was piled or forged. It would therefore have been unjust to hold any of the officials of the railway responsible for the defect of an ironmaster. It is easy for people to imagine that the entire roof is in a defective condition, and its removal is to a great extent a concession to clamour and the apprehensions of neurotic people. But the evidence showed that the cause of the accident could not have been obviated by any painting, for it was of a kind that was invisible.

It is generally admitted that flaws can arise in cast-iron. Many cases have occurred which proved that, in spite of great care in the manufacture, air-holes or similar defects originated either when the metal was in a molten state or during the process of cooling. The late Professor SORBY devised an electrical apparatus which, he maintained, could detect flaws in cast-iron. He considered that it would supersede the unscientific method of tapping with a hammer, which is still in use, and which, like the majority of empiric processes, is not always trustworthy. SORBY'S apparatus did not, however, find favour with engineers, and it cannot be said that any means has been invented to discover concealed or internal defects in either cast or wrought-iron.

Fortunately the defects rarely cause such a disaster as occurred in the Charing Cross terminus. Cast-iron is not utilised in construction to the extent that belongs to so useful a material, and wrought-iron is now superseded by steel. With steel it would not be necessary to unite the different parts of the fatal tie-rod by welding, and on that account there need not be much alarm about the safety of modern roofs. If steel is deemed to be an unsuitable material for roofs, it should also be prohibited from employment in connection with any structure where life can be lost through a defect in the material. Do passengers in steamers used for pleasure excursions ever consider the thickness of the material which is between them and death? The plates of a vessel like those of a structure on land are liable to rust, and the strains to which they are subjected are only assumed. It is an old maxim that a chain is not stronger than its weakest link, and few are able to calculate the force of the tugging on the links of a cable when the colossal mass of a vessel, aided by the force of wind and waves, is exerted to break the connection between the ship and the anchor. There is no doubt danger in steel beams, for there is a possibility of failure in nearly everything made by human hands. If we cannot use metal in roofing, beams and columns, then it would only be reasonable to abandon its use where the risks are greater and return to wooden boats and hemp cables. Peace may have its victories as well as war, but it has also its casualties, and they seem to be as unavoidable in cities and towns as on the battlefield.

The Charing Cross bridge was erected some forty years ago under the direction of Sir JOHN HAWKSHAW, who was a very cautious engineer. Sir JOHN WOLFE BARRY, who gave evidence on Monday, was as a pupil-assistant engaged in the erection of the roof, and was therefore aware of the tests employed. He stated that one of the principals was placed on a timber scaffold for the purpose of testing, and that pig-iron to the extent of 105 tons was suspended from the structure. The load was not merely distributed, but was applied unequally. Every deflection was noted. The principal was said to have borne the test remarkably well. It was probable that a special test was also applied to the tie-rods. The iron used was from Lord DUDLEY'S works, and Messrs. COCHRANE, who constructed the roof as well as the bridge over the Thames, were contractors who had gained the confidence of civil engineers by the excellence of their work. All that could be done by skill and prudence to make the roof safe was adopted.

It has been agreed that the cause of the accident was the unforeseen flaw in the tie-rod, and that it arose from imperfect welding. Sir BENJAMIN BAKER admitted that when he first saw the fracture he was unable to form a conclusion about the cause of its rupture. The strain was not more than a third of the breaking weight. On further examination it was found that the tie-rods, which varied from 4¾ inches to 5 inches in diameter—the broken one being 4¾ inches—were made up out of no less than eight bars welded together. With such a pile two short bars might be interposed, and as they could not be closely united from the ends there would necessarily be a flaw. There is no doubt that it arose in the making and was not caused by any strain after its erection in the roof, although unquestionably that strain must have increased the extent of the flaw until it became not less than two-thirds the area of the rod. Painting would not have prevented the evil; for although the rod lost about the eighth of an inch through rusting, that was an insignificant depreciation, for it was only $\frac{1}{16}$ of the diameter. In modern practice two tie-rods would be used with such a roof, and failure would therefore be avoided.

It was made evident that the tie-rod did not suffer from rusting. According to Mr. TEMPEST, the chief engineer of the railway, the only part of the roof which showed signs of rust was the underside of the glazing bars and the intermediate rafters. Sir BENJAMIN BAKER in discussing the subject said that an indefinite life could be given to iron. The danger in railway stations arose from the gases of locomotives and the inability to make the paint adhere. He described the anchorage chains of the Menai Bridge which was built by TELFORD eighty years ago, and said he had expected they would be oxidised, but on removing the paint he found the original blue scale and marks of the blacksmith's hammer. He considered that the Charing Cross roof had only lost about 6 per cent. of its original strength in about forty years.

Whether the wall was a factor in the catastrophe will be determined in the Law Courts, assuming the action taken by the lessee of the Avenue Theatre will not be settled. Mr. TEMPEST stated that after an examination of the viaduct on which the wall was built he could discern no cracks or settlement of any kind. But he admitted that if there had been a slight yielding of the wall the flawed tie-rod would be subjected to additional strain. Sir JOHN WOLFE BARRY said that the wall was never intended to support the roof in case of a failure of a tie-rod. If all the parts acted properly one of the principals, according to Sir BENJAMIN BAKER, could have been loaded with railway carriages without any collapse. The span was 164 feet, and there were fourteen main principals which were about 35 feet apart.

The report of the Board of Trade officers has yet to appear. But it is not likely that their examination will add to our knowledge of the subject. There does not appear to have been any deterioration beyond the wear and tear which was to be anticipated in so exposed a situation. The loss of life is to be regretted, but in the carrying out of the reparation and glazing it cannot be alleged that the contractors and their men were careless. An inspector said that he considered there was a little more material on the roof at the time of the collapse than was necessary for the work. But with principals that were tested up to 105 tons, a "little more" of

Digitized by Google

such materials as were being used could not affect its strength.

The inquiry has localised the cause of the catastrophe, and in that way has demonstrated that the reliance upon the strength of iron construction was not unfounded. The ironworkers no doubt believe that when the whole of the bars were fused by great heat and under enormous pressure into a homogeneous mass, the want of connection between two of the bars was of no account. In fact, the defective weld could only be discovered by brightening the metal and holding it in the light at a particular angle. That is a discovery which is not of so much account now that iron is superseded. But it will, of course, be taken as a lesson by steel manufacturers to have a more rigorous supervision of all parts of the process. With the exception of that defect the whole roof was in a sound state and could have lasted for several years. Indeed, it might be supposed that one of the results of the periodic examinations was to increase the confidence of the engineers, although it cannot be said that any painting or rapping of the tie-rod would have averted the catastrophe.

THE INTERNATIONAL SOCIETY'S EXHIBITION.

IT is rarely we find so much importance attached to sculpture as we see in the sixth exhibition of the International Society of Sculptors, Painters and Gravers at the New Gallery. The central hall is well adapted for the display of the art, and this year it may be said to be improved by the introduction of a soft canvas hanging which obviates the clashing of marble against marble. M. RODIN is the president of the Society, and two of his works have been contributed. The principal is *Le Baiser*. Presumably M. RODIN believes in the ancient theory, legend or myth that a figure is concealed within a block of marble. By the mass of rough stone which he retains he appears to suggest that he has been no more than a discoverer and revealer. The action of the nude woman, whose arm is round the man's neck, is passionate, and the figure, although not completely extricated from the marble, is graceful. The man, however, is to some extent passive, and the hands are very awkward. The *Paolo and Francesca* is a smaller group, and in this case also the left arm is ungraceful. The figures seem to be recumbent, the woman being above. But this is a suggestion of their whirling in the Inferno. The two works by M. BARTHOLOMÉ are disappointing. His splendid effort to suggest the mystery of death which is to be seen in Père la Chaise has made many an architect wish he had the sculptor's services at command. But for his *Adam and Eve* he has adopted types unnecessarily ugly, as if he wished to indicate that masculine and feminine beauty were the results of long years of evolution. His *Jeune fille se coiffant* is a statuette, and she may be using a stream for a mirror.

All things considered, the most interesting works this year are the panels in relief and figures by CONSTANTIN MEUNIER, the Belgian sculptor. During many a century the representation of mere labourers was avoided by sculptors. When there was a change agricultural labourers were preferred. MEUNIER was not afraid to adopt men who had to follow the varieties of toil which are most exacting on the muscles—miners, puddlers, quay porters, sailors and glass-blowers. They at once rivet the attention, as they are placed opposite the entrance, and the visitor will be wise who returns to them again and again from other rooms. They are not graceful, idyllic or superfine men. There is no suggestion of the *Apollo Belvedere* amongst them. Yet MICHEL ANGELO would have rejoiced at such a display of muscle. The sculptor was no sentimentalist, and he makes little attempt to excite the pity of the observer for the labourer. The men have to do hard work, but it must be felt that their frames are equal to the strain. Those who compare MEUNIER and MILLET do not understand either artist, and we cannot help feeling that the brawny Belgians would be insulted if they were said to resemble the pessimistic peasants of France. Mr. PAUL BARTLETT'S bronzes and torsos of girls are suggestive of his studies in a good school. The gloom of BEETHOVEN has been often expressed by painters and sculptors, but never in so strange a manner as by M. BOURDELLE.

The English sculptors hold their own in the assemblage. The *Orpheus* of Mr. BENJAMIN CLEMENS attracts more attention by the small dragon or giant lizard at the base than by the excellent nude figure. Mr. H. WILSON has a *Pietà* in high relief for the private chapel at Welbeck Abbey. Mr. STIRLING LEE has had to take to portraiture, but *Mrs. George Brown* and *Tommie* are two busts revealing unusual skill. Mr. ALFRED DRURY has a rather stern head for his statue of *St. George*, and a beautiful head of a woman called *The Spirit of the Night*.

There are nearly 200 oil-paintings by English and foreign artists. M. RAFFAËLLI has a vigorous view of Notre-Dame de Paris, which is no doubt produced by the aid of his new colours. HANS VON BARTELS, of Munich, in his *Flemish Inn*, suggests a day when the trees are bent by the wind and the sky full of heavy clouds. It is unpicturesque, but it is expressive of time and place. Mr. TARBELL'S *People at Breakfast*, which is lent by the Pennsylvania Academy, is one of those scenes of which the meaning is not apparent. A woman in evening dress seems to have found her way into a large room and is sitting down with a man who shares a roll with her. Very different is the banquet introduced by M. GASTON LA TOUCHE in *Le Mariage de Riquet à la Houppe*, which is one of the most brilliant pictures in the South Room. M. A. BESNARD'S paintings are more remarkable for their clouds than for their figures.

In the West Room Herr WENDLING, in his *News from Sea*, which belongs to the National Gallery at Berlin, reveals the care taken by some foreign artists in their works. The room is lofty, and everything is in the position that would increase the effect. The woman in it is reading aloud to a man in red seated at the entrance. Looked at as an instance of stage management the picture deserves some commendation, but the scene does not excite any interest. JOSEF ISRAËLS is usually fascinated by any subject which affords an opportunity for contrast of light and shade. But his *Indoors and Outdoors*, which represents a child standing in a doorway, was perhaps intended to suggest an hour when the contrast was less marked than at other times. Mr. JOHN LAVERY has a vigorous portrait of the *Bishop of Birmingham*, who appears in a purple cassock. The *Ladies Evelyn and Nora Hely-Hutchinson* offer a very strong contrast of dark blue and white in the dresses, and it becomes more marked by the absence of any accessory which would diversify the severity. Sir JAMES GUTHRIE'S presentation portrait of the *Marquis of Tullibardine* as commander of the Scottish Horse is a good example of that class of portrait which is intended for an heirloom. Mr. LAMBERT'S *Alethea* is clad in a black dress showing the bare arms and is accompanied by a greyhound. The rather wild landscape is out of keeping with the costume, but may hereafter give rise to conjectures. *The Enchanted Wood*, by Mr. MILLIE DOW, fully bears out the title. There is an air of mystery over the whole scene, and a glimpse is given of a woman near a lake who may be under a spell. The portrait of *Lord Justice Vaughan Williams*, whose black and gold robes stand out well against the red background, is a capital work of the late ROBERT BROUGH. The strong head would tempt any painter to exert himself, and in this case the likeness is expressive.

In the North Room the early contest for a recognition of realism is recalled by EDOUARD MANET'S *Le Linge*. He was the doughtiest combatant, and he sometimes adopted more crudeness than was necessary in order to assert the artist's right to do what he

Digitized by Google

pleased. The painting shows a woman in a garden, where she stands by a wash-tub, and a child looks on as if assisting. The incident is simple, but English people would prefer a different treatment. *Les Blanchisseuses*, by M. DEGAS, can hardly be considered as impressionist, for a very definite outline is suggested; but it must be admitted that the painting is not finished. It is therefore more likely to be an experiment of another kind. The two women are each carrying a basket of linen, and stand in relief against a yellow wall. For the circular portrait called *Mother and Child*, by Mr. J. DE FOREST BRUSH, the Society is indebted to the Pennsylvania Academy. It is another example of the perfection to which American artists have attained, for it would assert itself among any collection of portraits.

Water-colours, etchings and drawings have not been included in the collection, but they will appear at an exhibition to be opened on February 20. Without them the exhibition as it stands is well worth visiting. The general absence of incident pictures may disappoint those who wish to have a series of stories brought before their eyes which do not require the trouble of reading. That, however, is an advantage, because the majority of the paintings depend for any interest they possess on their technical qualities. The French have long given up the creation of little dramas or the illustration of scenes which are familiar in books. It is satisfactory to find so many English artists now following them. What is, however, desirable is that amateurs and collectors will adopt the painter's theory and judge the paintings simply by their merits and their correspondence to rules of art.

THE LATE FREDERICK SANG.

THE veteran architect and artist, the late Mr. Frederick Sang, was born in August 1813, in Offenbach-on-the-Main, Germany. As a young man he entered the Royal Academy of Munich, and studied architecture under Baron Gaertner. After this he went on his travels through Germany, France, Italy, Greece and Asia Minor, and then came to England to settle. In England a special Act was passed making him a British subject. He was the father of coloured architecture in this country, as, previous to his settling in England, all artistic decorative work was carried out by foreigners, principally Italians and French and a few Germans. He practised as an *architecte-decorateur* until about ten years ago, when he had to retire on account of his great age, although he was still active and working, &c., until the day of his death. Many important works in this country have been successfully carried out by him; amongst others, for the Corporation of the City of London, the decoration of the Royal Exchange when it was opened by Her Majesty the late Queen Victoria and the late Prince Consort. These decorations still exist, especially in the ceilings of the grand ambulatory, some of them being real frescoes. He also decorated the Coal Exchange and several other important buildings in the City. In the West End he decorated all the principal clubs, the chief mansions of the nobility and gentry, &c., as well as numerous celebrated mansions and public buildings in this country and abroad. In architecture he has also done a deal of work during his long career, viz. he received the first prize for covering the quadrangle of the Royal Exchange with a glass roof. This, however, was done years later by Mr. Barry. His Westminster improvements and concentration of Government offices with a new National Gallery in Trafalgar Square were exhibited in the Royal Academy, and were highly commended and approved by the authorities then in power. He also sent in a design for the Albert Memorial, the proposed Royal Mint on the Embankment, the Roman Catholic Cathedral in Westminster, the Oratory, Brompton, and other works too numerous to mention. In 1895 his scheme for an Imperial Chamber of Commerce in the heart of the City of London was submitted to the authorities; at the same time he submitted a scheme to Mr. Chamberlain and Mr. Balfour for expressing "the unity of Great Britain and her Colonies, and Protection to be restored to England." Abroad he planned the overland route to India by way of North Africa and the Euphrates Valley Railway; also the docks and granaries on the Danube. In this latter scheme the present veteran Emperor of Austria, as well as the then King of Bavaria, took a great interest, and granted him audiences to explain his scheme and approved the same. The last decorative work he did was in 1804, when he redecorated the Conservative Club, St. James's Street. After a busy life he passed away peacefully on December 27, and was laid to rest in Harrow-on-the-Hill cemetery on December 30, 1905.

WORCESTER CATHEDRAL.

A CORRESPONDENT of the *Toronto Globe* gives the following account of the impressions he received from a visit to Worcester Cathedral: –

There is nothing in the first glance at the exterior that would suggest the antiquity of the building or the storms which have raged about it when Royalists and Roundheads fought to the last gasp. The restoration, which lasted many years, was completed in 1874, and, as far as one can judge from the literature obtainable, the exterior, at least, represents practically a new edifice. As for the interior, it took skilled workmen a score of years to pick out the plaster which coated all the exquisite decorations in carved stone, and only after an incredible amount of toil was the vandalism of the Roundheads effaced. What it must have cost them in labour to cover up the marvellous carvings it is hard to say, but it certainly cost in wages the price of a moderate-sized church to undo their handiwork.

The proportions are marvellous, the groined roof, 68 feet in height, the tower 170 feet, are objects of beauty and of joy for ever. The first thing which struck the writer on entering was the pleasant warmth after the cold, bleak atmosphere of the outer world. But there was hardly a suggestion of antiquity in the first glimpse of the interior, and it came as a shock of surprise when one found oneself close to the tomb of King John, with his effigy cut in stone. Here he lies, wearing royal robes, with a crown of metal. The face has a moustache and beard, the hair is long, and a rather curious touch is that of the sandals with spurs inserted. It is said that this is the earliest royal effigy in England, and that it was carved shortly after the death of the king, hence it is supposed to be a good portrait. So here is a well-preserved relic of 1218. And a little further on, and taking up the whole of the bay on the south side of the altar, is the gem of the cathedral, the exquisite Gothic chantry containing the altar tomb of the young princeling of sixteen, Arthur, eldest son of Henry VII. Neither photography nor written description can do justice to this marvellous piece of carving in open and closed panelwork, enriched with figures and heraldic devices, with its flat-groined roof and curious flying supports. The east wall of this little chantry is covered with a rich mass of tabernacle-work with niches, each with some beautifully carved figure within. How one longs to be learned in architectural lore to picture this work of indescribable beauty and grace. This is the only portion of the cathedral which escaped mutilation by the Cromwellites, and possibly the charm, the exquisite beauty of the workmanship, implored in almost articulate pleadings to be left undisturbed.

These vast cathedrals always bring before one's visions those days when perfect hordes of sandaled monks filled the choir and nave. Can it be wondered at if a member of the Roman Catholic Church feels not a little "piano" when wandering through these churches and cathedrals which were once the property of their especial communion? Times have changed and the wheel turns slowly, but it is difficult often to distinguish the ornamentation, the altar fittings, the vestments used in these great cathedrals from those common to all the churches under the sovereign Pontiff. Here are the embroidered altar cloths, the candlesticks of metal, the central cross, often bearing the figure of the Crucified. Usually there is the lady chapel, where daily service is heard and where the members of the congregation are found before the altar, absorbed in silent meditation.

What delighted me most in the lady chapel was the tablet erected to the wife of Izaak Walton, the famous wielder of rod and line. The inscription was quaint in the extreme, and ran somewhat as follows, "A woman of remarkable prudence and of the primitive piety."

In the south transept is a case containing some really curious relics, amongst other things a golden paten, found in the coffin of one of the bishops, and this is used in the celebration which takes place in the crypt once a year when the anniversary of the patron saint comes round. Among

Digitized by Google

other curious things was a bit of the skin of a Dane who had been flayed for sacrilegious theft and his skin nailed to the door of the church. It might have been the hide of a modern politician, it was so tough. There beside it was Wycliffe's translation of the New Testament, exquisitely illuminated by the monks, the gold and scarlet as bright as if done yesterday. Speaking of illuminating, the cloisters to the south of the church are something one cannot forget. Here are the "peeping slits" where one of the monks looked through to watch that his brethren did not doze instead of work, and one could picture the row of monks, each engaged on some piece of work, feeling that they had an overseer to keep them up to the mark. Just off this cloister is the chapter-house, an immense decagonal chamber, where the authorities of the cathedral meet each year, but the stone seats carved in the wall have been removed. From the cloisters we were taken to the crypt. "Early Norman apsidal, and remarkable for its beautiful groining," announced our guide, and we looked at him with awe and reverence, his sentences were so learned, his manner so superior. To me it was peopled with shadows of bygone tragedies. It mattered little if it were Early Norman or Early English; it spoke of the mighty dead, of struggle and of bitter woe. "Don't, for Heaven's sake, become depressed by the shadow of the dead," an Englishman said to the writer the other day. "You colonials bring such an inspiring sense of the future in this land of the past, and if you stay here too long you will get like the rest of us, hunting in dungeons for the gloom of a gory past." How true it is. One whiff of the prairie air would dispel the vapours of the mouldy crypts, and the very sight of something resembling a huge iron stove, reminiscent of Canada, as we emerged from the greyness and chill of the crypt gave one a sense of cheer and encouragement.

Such is life. This beautiful edifice, wonderful in its proportions, in its mass of detail, its glory of stained windows, carving and priceless reredos of alabaster, simply reeks with the memories that one would fain consign to oblivion. In passing out I noticed a chapel in one of the south bays I had not seen before. You entered a door, a portion of a marvellously carved wooden screen, and found what looked like a private oratory. This was the Jesus Chapel, with an enormous crucifix carved in wood, flanked on each side with wonderful carved wings, and in the dim, rich light from the stained window one discovered a score of prie-dieus where one or two women were kneeling in meditation and prayer. I could not find out the history of that chapel, which interested me greatly, for the work was assuredly by one hand and the carving of an excellence rarely seen outside of Italy.

But time waits for no man. It was only a hasty visit, all too short, and yet perhaps leaving all the more vivid impression because of its brief character.

DUTIES ON AMERICAN PLANS.

A MEMORIAL from Canadian architects has been presented to the chairman of the Canadian Tariff Commission, respecting the necessity of the imposition of duties on plans sent by American architects for buildings in Canada. It is as follows :—

Sir,—The Ontario Association of Architects and the Toronto Architectural Eighteen Club beg respectfully to call your attention to the injustice done to Canadian architects by the present tariff on architectural drawings. Prior to December 1901, the duty on drawings coming into Canada from the United States was as follows :—

"Each set of original drawings, or single set of blue prints of same if brought into Canada as a substitute for the original drawings, 2 per cent. of the estimated cost of the building to be erected thereon.

"Same, if accompanied by details, 3 per cent. of such estimated cost.

"Details or blue prints of same, if imported separately, 1 per cent. of the estimated cost of such detail.

"When additional sets of blue prints of the same set of drawings are imported, such additional sets of blue prints are to be valued for duty at 5 dols. per set, in addition to the value of the original drawings or first set of blue prints imported in lieu thereof, as above."

This schedule was cancelled after the above date, for what reason we are unable to state. The duty as now in force is practically nominal, being a charge upon the value of the paper only and the time spent in making copies, such as blue prints.

As an evidence of the unreasonableness of the present tariff and the hardship inflicted on Canadian architects, American architects may erect expensive buildings in Canada, having all the draughting done in the United States, whereas Canadian architects are practically debarred from carrying on work in the United States under any condition by reason of the duty and the alien labour law.

We would suggest a tariff as follows :—

Each set of original drawings or single set of copies or blue prints of same, if brought into Canada as a substitute for the original drawings, 40 per cent. of the architect's fee, the architect's fee being at 2½ per cent. on the estimated cost of the building, for working drawings and specifications. The same, if accompanied by full details, or for full details afterwards furnished, 40 per cent. of an additional fee of 1 per cent. on the estimated cost of the building.

When additional sets of copies or blue prints of the same set of drawings are imported, such additional sets of copies or blue prints are to be valued for duty at 5 dols. per set, in addition to the value of the original drawings, copies or blue prints. A declaration to be taken that such sets are merely duplicates of drawings or copies or blue prints already imported.

The following is a comparison of the 1901 and the suggested schedule as they would work out in a 100,000 dol. building :—

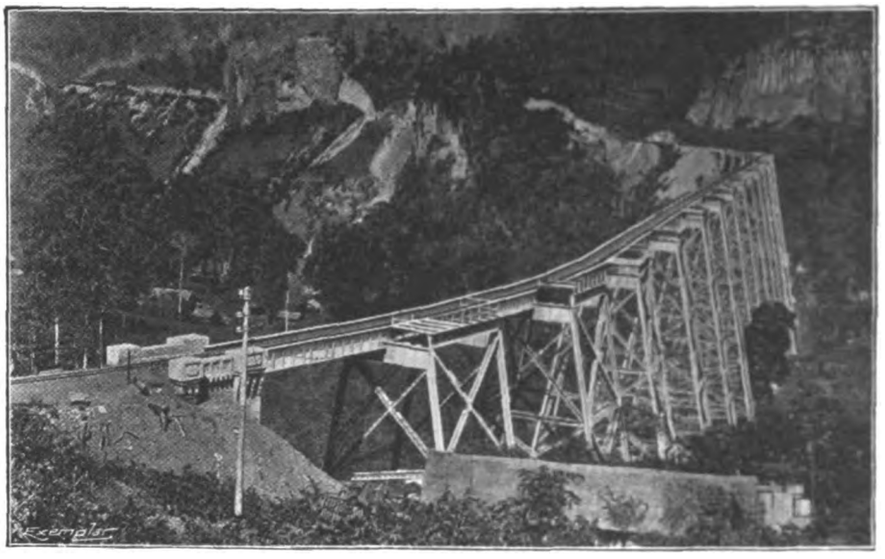
THE 1901 SCHEDULE.

	Dols.
2 per cent. on cost of building (100,000 dols.) . . .	2,000

THE SUGGESTED SCHEDULE.

1 per cent. on cost of building (100,000 dols) . . .	1,000
Or, instead of the above by a rating of 40 per cent. on the architect's fees which should be put at 2½ per cent. on the cost of the building for plans and specifications. (Example) the duty on a building costing 100,000 dols. would be, architect's fee at 2½ per cent., 2,500 dols., and a duty of 40 per cent. on such fee would be . . .	1,000
For detail drawings the architect's fee should be put at 1 per cent. on the cost of the building. (Example) the fee on details of a building costing 100,000 dols. would be 1 per cent. on 100,000 dols. or 1,000 dols., and a duty of 40 per cent. on such fee would be	400
Note.—The present duty on drawings of a 100,000 dol. building is the nominal sum of say	5

THE BRITISH SCHOOL AT ROME.



THE first open meeting of the British School at Rome for the current season was held on Thursday, January 4, and was attended by the British Ambassador and by many foreign scholars and British residents in Rome. The assistant director, Dr. Ashby, read a paper on sixteenth-century engravings illustrative of Classical sculpture, pointing out the importance of the subject in relation to the catalogue of the Capitoline collection of sculpture, which is in course of preparation by the school. The evidence of engravings is often of value with regard to the condition of a statue at the time of its discovery, and also as to its provenance and subsequent history. He then exhibited a copy of the first edition of the famous plan of Venice in six sheets, a woodcut of 1500, the author of which is unknown, though it is often attributed to Jacopo de Barbari. Mr. A. J. B. Wace, librarian of the School, followed with a paper upon two Roman historical reliefs preserved in the Louvre, which were formerly in the Borghese collection. By the combination of evidence drawn from various sixteenth-century sources he was able to demonstrate that they were discovered in Trajan's Forum about the year 1540, and thus to make an important addition to our knowledge of the decoration of this series of buildings.

The Caversham Urban District Council have asked the following architects to submit designs in a competition for a library :—Mr. F. W. Albury, Messrs. Cooper & Howell, Mr. J. Hugh Goodman, Mr. W. G. Lewton, Messrs. Millar & Cox, Messrs. Joseph Morris & Son, Messrs. Ravenscroft, Son & Morris, Messrs. Charles Smith & Son, Mr. James Haslam, Mr. S. Slingsby Stallwood, Mr. Geo. W. Webb, Mr. W. Wing, Mr. N. T. Salmon and Mr. W. G. A. Hambling.

A BURMESE RAILWAY VIADUCT.

A CORRESPONDENT in Burma has sent us the photographs, now reproduced, of a railway bridge which not only excites the wonder of the inhabitants, but terrorises some of them by its height and apparent frailty. Since the country was subjected to British control efforts are being made for its improvement. Burma is rich in minerals and forests. Although there were facilities for internal communication by means of rivers and canals, they cannot compete with railways. In 1877 one railway was commenced and another in 1884. The annexation of Upper Burma gave an impetus to railway works, and the system has now, we believe, a length of nearly three thousand miles. In Lower Burma, part of which has been held by Great Britain from 1826, railway construction is comparatively easy. But in Upper Burma there are several mountain chains which require tunnelling, as well as viaducts over gorges. The gradients are sometimes so steep that a carriage can travel for several miles without any aid from a locomotive. The approach to the Gotick bridge is of that kind. It will be seen from the illustration that a tunnel had to be opened close to the bridge. The framed piers of the bridge were constructed at points where they could be raised economically, and the central piers are not more than 350 feet above the rocks. But the depth of the gorge near them, in which there is a waterfall, is increased to 800 feet. The whole of the district is more remarkable for its wildness than its fertility. It is expected that the station will be used mainly by travellers who are eager to view scenery which before the construction of the railway was inaccessible to them. In order to accommodate them a bungalow has been erected, and it can be taken advantage of by passengers wishing to make explorations in the country. Landscape-painters could not discover a region which affords more novel subjects. Indian scenery has not been appreciated by Europeans, but in Upper Burma there are localities which deserve to be considered as revelations of the sublimity of nature. It will be observed that there is no handrail to the bridge. This suggests how few passengers stop there, for it requires a strong head to be able to look down into the chasm. In course of time more precautions for safety will be taken.

RURAL BY-LAWS.

ONE of the results of the new *régime* at the Local Government Board is the following letter to rural district councils:—

Local Government Board, Whitehall, S.W.:
January 5.

Sir,—I am directed by the Local Government Board to state that it appears from a Parliamentary return which they have recently caused to be prepared relating to the by-laws with respect to new streets and buildings in force in the rural districts of England and Wales, that throughout the whole of 169, and in parts of 114 rural districts, by-laws are in force based on what is known as the Urban Model Series. This series is a comprehensive one, including clauses on most of the subjects upon which urban district councils are authorised under section 157 of the Public Health Act, 1875, to make by-laws.

Since the issue of this code, which was primarily intended for use in urban districts, it has been strongly urged that its adoption in districts which are of a rural character has led to interference with reasonable building operations, and the Board feel that a series of by-laws so extensive as the Urban Model is not necessary for a district or part of a district quite rural in character, where little building is going on and aggregations of population are not likely to develop in the near future. In such cases it is considered that a less elaborate code of building regulations would generally be found sufficient. In order to meet the requirements of such localities the Board in 1901 compiled a model series of building by-laws for rural districts, dealing only with the subjects which appeared to them to be most in need of regulation and control in such districts from a sanitary point of view. This series has commended itself to rural district councils in a large number of cases, and, as appears from the Parliamentary return, by-laws of the character of this model have already been adopted throughout 106 and in parts of thirty-two rural districts.

The Board are aware that there are in not a few rural districts areas possessing urban characteristics, or containing considerable aggregations of rapidly growing populations for which a more comprehensive series of by-laws is desirable. Indeed, in areas of this kind the by-laws might properly and desirably approximate to those in force in urban districts. Parts of rural districts having such special circumstances can always be separately dealt with if such areas can be suitably defined. But the Board think it probable that amongst the rural districts in which the Urban Model Series is in force there are many parishes or other areas which cannot be said to have urban characteristics, and in which the by-laws in some respects impose undue restrictions on building and are more onerous than the circumstances require.

The Board are desirous that no obstacles should exist which can properly be avoided in the way of an extension of housing accommodation, whether by local authorities or private persons, and the object of this circular is to secure that whilst sanitary requirements should be strictly observed, all unnecessary impediments in the development of building should be avoided.

The Board would be glad if the rural district council would carefully review the circumstances of their district for the purpose of seeing whether any modification of the present by-laws is desirable, and whether any part of the district might more suitably be placed under a series based on the Rural Model, or, if this is not thought suitable, by such a series supplemented by a limited selection of clauses from the Urban Model. In some cases relaxation has already been given by a clause exempting detached dwelling-houses from certain of the restrictions as to the construction of walls. Even where it is considered that the full code of by-laws should be retained, the existing by-laws, unless made very recently, might with advantage be reviewed in connection with the latest form of the Urban Model. This contains many additions and modifications based on the experience of the working of the old model, and at the same time is framed so as to give more elasticity in the administration of the by-laws.

The Board wish to be informed of the result of the consideration of this letter by the rural district council, and they will be pleased to supply draft forms for use in connection with any revision of the present by-laws and to afford any information which they have at their disposal on the subject of by-laws of the kind in question.—I am, Sir, your obedient servant, S. B. PROVIS, Secretary.

NOTES AND COMMENTS.

In the United States architects are likely to be offered opportunities not only to design buildings but to produce plans for the remodelling of cities. Mr. D. H. Burnham appears to be in favour for the latter class of work. He has prepared a plan for the improvement of San Francisco which will cost at least 50,000,000 dols. The work would, however, require about half a century, to be carried out in its entirety. San Francisco was only a mission station prior to 1846, and the population was less than 500. The discovery of the goldfields for a time seemed to be likely to give rise to a city which would supersede it. But there was a reaction, and the old city has since advanced at a rapid rate. The population in 1900 was 342,782. Being a comparatively new city it is practicable to introduce improvements at a more moderate cost than in New York or Boston. If the people will accept Mr. Burnham's propositions it will be an example which is likely to be followed in other parts of the States.

There is almost a terrible responsibility cast upon a committee appointed by the Municipal Council of Paris. That city in imitating London was bound to have an underground railway. It was out of place in Paris, where there is so much to gratify the eyes of people. It has been alleged that the Metropolitain is in many places carelessly constructed, and that catastrophes await not only the passengers, but also the inhabitants of houses along certain parts of the route. The workmen who have been employed on the underground operations are the strongest witnesses against the work in which they have been engaged. Their statements may be exaggerated, and may not be of more value than those recently expressed in Dublin respecting the new sewers. The engineers declare that generally the railway is in a safe condition, although in parts there may be irregularities. It is impossible, however, to arrive at any decision on the subject until the report of the commission appears. It may be found that any unsafe work was executed in order to compel the public to have less confidence in a costly undertaking.

One of the treasures of St. Petersburg is a piece of stuff richly adorned, which is supposed to have been part of a robe worn four centuries before our era. It is beautifully ornamented and suggests the character of Greek costume. It has often been illustrated, and apparently deserves all the praise it has received. In interest it must be considered as inferior to another fragment of a textile which is at present in the museum at Cairo, and which Brugsch Bey believed to be at least 3,330 years old. It is therefore a thousand years more ancient than the Macedonian or Greek example of which Russia is the possessor. Evidently it is a State robe worn by the Egyptian monarch, and yet it is as much remarkable for its simplicity as for its ornament. There are seven rows of flowers, including the lotus and the papyrus. There is also a symbolic serpent. The figures were not embroidered or painted but were woven, proving that in so remote an age the art had attained a high standard. The dyes used in those days, and especially red and blue, were equal to any which are now known.

ILLUSTRATIONS.

13 HYDE PARK PLACE, BAYSWATER ROAD, W.

The accompanying illustration of the above mansion flats which have been recently completed shows in the design that an advance has been made in the right direction for the architectural treatment of a large building. The front elevation overlooking Hyde Park is five storeys high, and is composed of a recessed centre flanked by two projecting wings. The windows on the front are coupled, and with the projecting balconies and rich ironwork form groupings subordinate to the general scheme. The whole building is surmounted by a finely proportioned cornice and balustrade. The entrance hall and staircase form part of the same architectural scheme, and have been carried out in stucco, a similar material to that used at the Scala Theatre. The materials employed for the elevations were Ham Hill stone and cast-iron for the balcony railings, the contractor being Mr. Frank Bush. The whole of the work has been carried out from the designs and under the superintendence of Mr. Frank T. Verity, F.R.I.B.A.

BISHOP'S THRONE, ROMAN CATHOLIC CATHEDRAL, SALFORD.

This throne is in the Catholic cathedral of Salford, one of the conspicuous buildings of the earlier revival, designed by Messrs. Weightman & Hadfield on the lines of Selby Abbey, that is, as regards the choir portion seen in illustration. The throne is of oak. The three angels bear on their shields in proper heraldic colours the cognizances respectively of Pope Leo XIII., then reigning; Dr. Bilsborrow, the then Bishop of Salford; and of Cardinal Vaughan, his predecessor in the see and at that time Archbishop of Westminster. The summit is occupied by the figure of St. John the Evangelist, patron of the church. Portions of the figures are gilt. The architect is Mr. W. Randolph, of 8 King Street, Manchester (now of the firm of Messrs. Randolph & Holt). The body of the work was carried out by Messrs. Hatch, of Lancaster; the figures were carved by Mr. Bridgmans, of Lichfield; the faldstool and seats executed by Messrs. Cox & Buckley, of London. The side curtains intended to complete the arrangement have not been added.

DESIGN FOR PROPOSED MUNICIPAL BUILDINGS, LAW COURTS, AND TOWN HALL FOR BOURNEMOUTH.

The design for the Bournemouth Municipal Buildings, Law Courts and Town Hall by Mr. F. W. Lacey and Mr. C. E. Mallows has been considered as too expensive. But from the character of the design it merits a place among our illustrations. The principles upon which the scheme is based are (1) that the form of the plan in mass should be determined by the outline of the site, as it was considered essential that each elevation should conform to the lines of the roadways; (2) that the northern centre of the group of buildings should be occupied by the town hall; (3) that the law courts be placed on the east side and the municipal buildings on the west. The varying levels of the ground have afforded an opportunity which may be considered as unique of planning a building in such a manner that three distinct ground-floor levels are obtained, each with a separate entrance from the street. In that way obvious facilities in the everyday work of each department are secured. The style adopted was that employed in this country during the seventeenth and early part of the eighteenth centuries, and which has the advantage of allowing large window spaces. The view, which is taken from the Christchurch Road on the south-east side, shows that a balanced and dignified elevation is given to each frontage. The general effect of the building, from whatever point of view it is taken, is concentrated on the dome, which rises from the exact geometrical centre of each elevation, and dominates the whole of the composition. With regard to the construction, care was taken that walls should come over walls, piers over piers, and windows over windows throughout the design. And as a consequence steel construction is almost avoided. The estimate for the municipal buildings and law courts was 78,000*l.*, with an additional 48,000*l.* for the town hall. The basis of calculation was 1*s.* per cubic foot of space. The estimate included the internal completion of the dome, but not the upper external portion, which would cost about 8,500*l.*

THE COLONIES AND COLONIAL ARCHITECTURE.

(Continued from last week.)

SOUTH AUSTRALIA.

THIS colony has a total length of 1,850 miles, the extreme breadth being 650 miles, and the total area about 903,000 square miles. The population at the last census was about 365,000. There is an endowed university at Adelaide, founded in 1881. A State school of mines and industry has also been established. The public library, museum, art gallery and local institutions are supported or assisted by the State at an annual cost of about 10,000*l.* The total value of the commerce in 1903 was about 15,000,000*l.* in imports and exports. The length of Government railways open in 1903 was 1,739 miles, the total cost being about 13,500,000*l.* Adelaide, the capital (founded in 1836), is situated on the river Torrens, in the middle of a large plain, and possesses excellent buildings, churches of many denominations, clubs, libraries, and all the conveniences of a modern city. It is, moreover, said to be the best drained city in Australia. In the south-eastern division of the colony is the town of Mount Gambier, near to which good building stone is found.

WESTERN AUSTRALIA.

This embraces an area of 1,000,000 square miles, or something like eight times the extent of the United Kingdom. A portion of it is situated in the tropics, but the greater part is in temperate zones. It contains some of the most paying gold mines in the world, the output of the colony being estimated at 9,000,000*l.* worth every year. In the temperate portion there are very large areas of agricultural country which are being rapidly occupied, and in consequence of the gold production, the extension of agriculture and the extensive exports of jarrah, there is a great deal of building, especially in the larger towns, of which Perth is the chief. The jarrah forests embrace an area of 8,000,000 acres, and the timber is now almost exclusively used in the State for building, its only rival being karri.

With regard to the illustrations:—(1) The Government House at Perth is the residence of the Governor appointed by the Crown—at present Sir Frederick Bedford. The style of building is considered to be very much in common with what one sees in the country houses of the well-to-do in England. There is also shown a small portion of the well-kept grounds. The interior fittings and decorations are of highly polished jarrah, which has a beautiful effect. (2) The hospital at York is more typical of colonial architecture, showing how verandahs are added to protect the woods from the direct rays of the sun.

We have before us a copy of some notes on the jarrah timber of Western Australia by the late Mr. C. Y. O'Connor, who stated that:—

"For durability in general construction work of all classes jarrah is undoubtedly one of the very best of all known Australian hardwoods, and in regard to strength compares fairly well with most foreign timbers. For wharves and jetties jarrah is exclusively used in this colony, and of all Australian timbers is the best to resist the devastations of 'Cobra' and 'Teredo navalis.' Of all the West Australian timbers jarrah is also the most successful in resisting the ravages of white ants; hence the principal reason for its being of late years exclusively used for railway sleepers."

Mr. C. S. R. Palmer, the former engineer-in-chief of Western Australia, and now the colony's consulting engineer, has also favoured us with the following further notes on the uses of jarrah timber:—

"In September 1899 the late Mr. O'Connor, then engineer-in-chief of this State, dealt with the uses of jarrah in positions where it is pre-eminently suitable owing to great density, strength and toughness; but in addition to these uses the timber has been employed more or less in all classes of building operations in this State, and as its qualities have become better known, and the difficulties inherent in working so dense and hard a wood have been overcome, its employment has been increasingly great. The one defect to be guarded against is the tendency of jarrah to warp when exposed to the direct rays of the sun. It has of late years been used almost exclusively in public buildings, more especially in connection with engineering works in the rougher portions, such as railway platforms, fencing and kerbing, wall frames with brick nogging or weatherboards, verandah posts, roof timbering and beams, and, in fact, wherever lightness is not a desideratum, and for such uses possesses the especial quality of not suffering from rot when built into masonry or let into the ground. In buildings where there is much traffic, and also in private houses, jarrah planks furnish a durable, cleanly floor, capable if desired of high polish. Skirtings, dados, rails, architraves, door frames, transoms, mullions, doorsteps, staircases, mantelpieces and furniture, more particularly in public buildings and large houses, have been and are being increasingly made of this wood with very handsome results."

Nor should we omit to mention the splendid services that jarrah has rendered for street-paving purposes, in which connection we have before us the table of returns issued by Millars's Karri and Jarrah Company, Ltd., showing that in the judgment of a very large number of the municipal engineers of the Metropolis and the leading provincial towns of the United Kingdom, karri and jarrah paving blocks are the most durable in common use, while in Australia, the country of origin, the testimony is equally if not more satisfactory. On the score of durability, economy, hygiene, safety, as well as quietness and ease of traction, the evidence is decidedly in favour of the woods named for street-paving purposes.

TASMANIA.

This island, which was formerly known as Van Diemen's Land, is separated from Australia by Bass Strait, 120 miles wide, and its greatest length is about 230 miles, while its greatest width is about 190 miles. According to a rough estimate, its surface is 26,215 square miles, or about 4,000 square miles less than the whole extent of Ireland.

Hobart, the capital, has a picturesque position on the river Derwent, and possesses a fine harbour, all the comforts of a modern city, and the neighbourhood is delightful. The public and other buildings are usually of a very substantial character, and according to English ideas of architecture. The cathedral at Hobart is a large stone edifice, capable of seating over a thousand persons, and is one of the handsomest buildings in the city. There are several Roman Catholic churches, including a cathedral.

A considerable part of the island is more or less thickly covered with timber, the predominant tree being the eucalyptus, which grows to a great height. Of all Tasmanian trees, gum trees are the most remarkable from the immense size to which they attain, their very general distribution over the island, and the wide range of uses to which their products may be put. The trunks of these trees are straight and cylindrical for 100 feet and upwards, with only a small amount of taper; the whole tree will measure from 200 to over 300 feet in height, the diameter of well-grown trees varying from 3 to 6 feet. Piles have been recently cut for the Admiralty Works, Dover, 120 feet long and 20 inches square. Bridge beams and large wharf-timbers also are cut on "the quarter," not sided down out of the round timber, as is done with smaller European trees. Blue gum is especially esteemed for piles, owing to the large size that it attains, and the comparative immunity it enjoys from the attacks of the "teredo." It is also used for ship and boat-building, the superstructure of wharves and bridges, railway sleepers and trunk bodies, builders' scantlings of all kinds, joists, frames, beams, floor-boards, &c. Amongst the Government exhibits in the exhibition held at Hobart some years ago was a sample of bridge-decking that had been about 50 years under foot-traffic, and which was still hard and sound. The life of the wharf-piling in Hobart is reported to be twenty-five years. These piles are up to 80 feet in length, and are driven in 40 feet of sea-water. Stringy bark resembles oak in appearance, and is the most general timber for all sorts of constructive works in the State. It makes excellent piles, especially for fresh water. It is also used for shipbuilding, the construction of wharves and bridges, mining purposes, and for railway sleepers, for the dadoes, flooring and fitting of houses, and for furniture. When polished it has a very pretty effect as a ball-room floor or for wainscotting. The stringy bark of Tasmania is especially suited for wood-paving. The blocks do not polish under traffic, but give a good foothold for horses. Stringy bark blocks properly laid will last, we are told, under heavy traffic from fourteen to twenty years. There are about fifty trees that are indigenous to the island, described as timber trees, from which some most valuable woods, both hard and soft, are obtained; also woods for cabinetwork that cannot be surpassed anywhere, and some very handsome decorative woods.

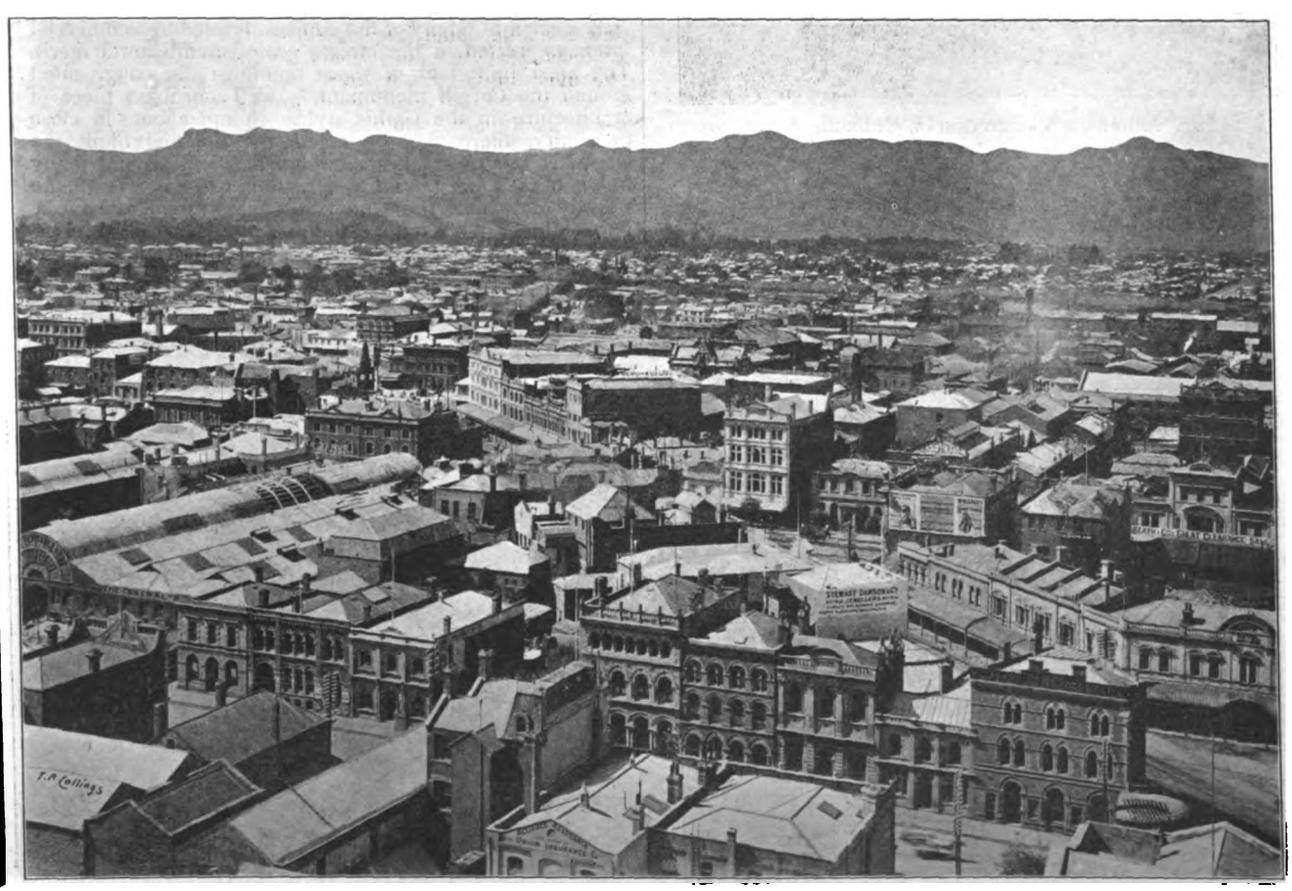
NEW ZEALAND.



The area of the colony of New Zealand, to which we next turn our attention, is about one-seventh less than the area of Great Britain and Ireland, the middle island of New Zealand being a little larger than the combined areas of England and Wales. The country is heavily timbered and possesses vast forests of native trees. Many of these yield timber of the most useful kind, both hard and soft varieties being obtainable in large quantities. Almost all the residences of New Zealand are frame-built, and most of the furniture used is manufactured in the colony from native timber. The woods most generally in use are kauri, rimu or red pine, totara and kahikatea or white pine. Kauri is distinguished for the soundness of the timber and its almost perfect immunity from faults. Its slow growth results in a fine grain which has long led to its consideration by architects and builders. Thousands of houses in Australia and New Zealand have been entirely constructed of kauri pine, the durability of which is unquestioned. In every department of building work it has demonstrated its serviceability, and is now being largely employed for open-roof work, dadoing, panelling, moulding, architraves, doors, flooring, lining and all kinds of joiners' work. Its excellent appear-

CHRISTCHURCH (NORTH), NEW ZEALAND.

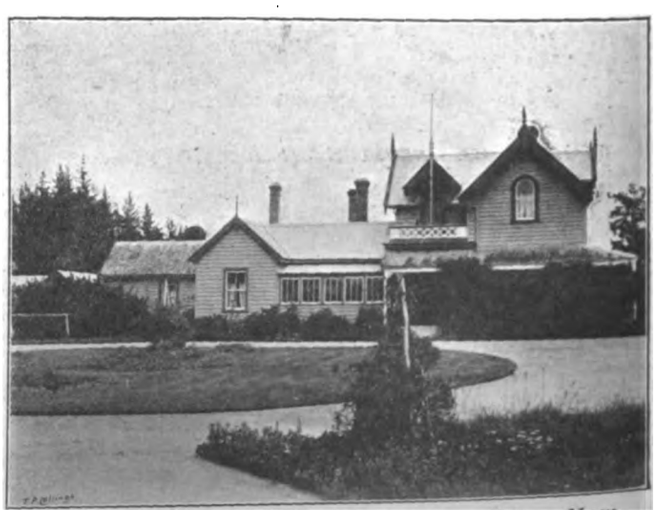
Digitized by Google

ance combines with its durability in suggesting kauri pine as a splendid timber for church furniture and for the fitting of public buildings generally. Colonial architects are said to regard kauri with much favour for church work.

The population of Wellington, with its suburbs, is about 50,000, and, being the seat of Government, it contains the residence of the Governor and headquarters of the Government departments. Noticeable among the public buildings is the General Post Office, and near it is the handsome building of the Government Life Insurance Department, which institution is said to have been originated by the judgment and foresight of Sir Julius Vogel, for many years

ST. ANDREW'S PRESBYTERIAN CHURCH, AUCKLAND.

Premier and Colonial Treasurer of New Zealand. The spacious building erected for head office was designed by Mr. F. de J. Clere, architect, and erected by Messrs. Carmichael & Sons, builders. It forms a conspicuous object on a prominent site, and is considered one of the handsomest structures in the city. It is practically fireproof, nearly all the internal divisions being brick, while many of the floors are of solid concrete with rolled iron girders, and where timber joists have been employed concrete has been placed between them. The large number of strong-rooms is a noteworthy feature, while the sanitary and heating arrangements are of the latest description. Wellington is lighted by electricity, and an excellent water supply is obtained. Many handsome concrete and brick edifices adorn the city. The free library is considered a fine specimen of architecture. Many of the principal warehouses and stores are built on reclaimed land from the sea.



Auckland is the largest city in the colony, with a population of about 68,000, and whether viewed from the hills in the vicinity or from the sea always presents a fine picture. Charming residences nestle at the foot of the hill, while gardens enclosing tasteful villas extend for several miles. The principal street is Queen Street, which contains most of the important buildings, prominent among which are the steamship company's offices, Victoria Arcade, Bank of New Zealand, *New Zealand Herald* offices, the Savings Bank, insurance companies' offices, and numerous other commercial buildings. The public buildings include, among others, the post office and Customs house; then there is the museum, containing probably the finest Maori collection in the world. The free public library and art gallery are in the municipal buildings, a fine structure that cost some 22,000*l.*

The "city of the plains" is the popular distinctive title applied to Christchurch, which well describes its situation, for the Avon wends its way through the practically level plain on which the "cathedral city" is built. The town is laid out in rectangular form, 2 miles by 1¼ mile, the streets being 66 feet in width. The architecture and surroundings of Christchurch are regarded as English in character, while the many substantial structures that help to form Cathedral Square are handsome in appearance and have an exceedingly well-built look. The cathedral is in the most central position of the city and is said to be the same height as the "Monument." Other important public buildings are the post office, Christ's College, museum, &c. The population is about 57,000.

Dunedin, the capital city of Otago, is considered the largest, best built and most important commercial city in New Zealand. Many of the edifices devoted to commercial interests erected in the streets are of architectural merit. The most important of these buildings are congregated around the Cargill monument, a well-conceived piece of architecture in the Gothic style. Round about, in close proximity, there may be noted the Colonial Bank, the Grand Hotel, the insurance companies' offices, and many fine houses of substantial construction, while nearer to the railway and wharf the Union Steamship Company have a fine building. The public buildings of Dunedin are less pretentious in character, with the exception of the town hall, a really fine building situated in the centre of the city.

THE COTTAGE EXHIBITION.

IN the Journal of the Royal Sanitary Institute is a report of the paper read on the subject of "Rural Housing" at a meeting held on November 14 and of the discussion which followed. The following are the conclusions drawn by Mr. T. W. Aldwinckle after an examination of the exhibition at Letchworth :—

In the first place, no striking novelty in construction has been produced. With the exception of a few cottages, which have their external walls of concrete of thicknesses varying from 7 inches to 10 inches, there are practically no suggestions of any real value as regards new materials or construction for external walls, and thus we have only a choice between brickwork and concrete. External walls of open timber framing or of thin plaster or concrete slabs are quite out of the question in this climate. It is plausibly said that many of the old cottages were of wood and were very comfortable. No doubt they were. The windows were very small, seldom open, and there was no attempt at ventilation. Nowadays circumstances are very different. The windows are larger, ventilation has to be considered, and a cottage with thin external walls of whatever material could not be kept comfortable (*i.e.* warm) in winter without a great expenditure of fuel. As to durability, it must be obvious that walls of timber framing or very thin slabs of plaster or concrete cannot be considered permanent in the true sense of the word, nor the class of construction upon which money could be borrowed. Again, the cost of repair must be considered. Cottages built of slight and perishable materials will cost a serious amount per annum for their upkeep. As to fire, some of the timber cottages in the exhibition are mere tinder-boxes. There is only one external wall in the exhibition, other than of brick or concrete, which deserves consideration, and that is to the pair of cottages by Messrs. Potter & Co. (No. 35). This consists of steel framing (3 inch by 3 inch-steel joists) with steel lathing on both sides, covered with rough-cast externally and plastered internally, leaving an internal air-space of about 4 inches. This, however, cannot be equal to a 9-inch brick wall, and would not be much cheaper.

We thus get back to either the brick or concrete wall. In those districts where good ballast can be obtained on the site it is possible that a 9-inch concrete wall would be slightly cheaper than a 9-inch brick wall, but it is very doubtful whether the small economy would outweigh the undeniable advantages of brickwork. We apparently come, then, to the conclusion that, all things considered, a brick wall is most suitable for these cottages. The thickness must not be less than 9 inches, and an 11-inch hollow brick wall is preferable (No. 69, which has taken the prize for the cheapest cottage, has this). In any case the brickwork should be covered with rough-cast, as an additional protection against the weather. This external covering is even more necessary for a concrete wall.

It may be convenient to give a short description of some of the special constructions of the external walls other than brick or ordinary timber framing.

No. 25. Brick-nogging, rough-cast.

No. 35. (Single.) Concrete 7 inches thick, rough-cast.

No. 35. (Pair.) Steel construction 3 inches by 3 inches, with steel lathing on sides, covered externally with rough-cast, air space internally.

No. 36. Solid oak posts, with 3-inch compressed cement concrete slabs filled in between (into grooves).

No. 38. 10-inch by 8-inch hollow concrete blocks finished externally in imitation of stone.

No. 40. Brick-on-edge, reinforced with ironwork as patented by the Fireproof Partition and Spandril Wall Company, with rough-cast externally.

No. 47. Timber framing, expanded metal lathing, and Portland cement rendering.

No. 48*a*. "Mack" slabs 4 inches thick, covered with rough-cast.

No. 50. 6-inch timber framing pugged and covered with rough-cast.

No. 53. 4-inch timber framing covered with "Uralite" Kent board.

No. 58. Concrete blocks, 32 inches by 9 inches by 10 inches, finished externally in imitation of stone.

No. 59. Concrete 7 inches thick.

No. 69*a*. 6-inch concrete cast slabs slightly reinforced with steel.

No. 72. 1-inch weather-boards, one layer of inodorous felt and asbestos cement sheeting ¼-inch thick.

No. 73. Two 2-inch concrete slabs with an air space between.

No. 77. Overlapping vertical boards, 8 inches by 1¼ inch, interlined with ferol sheeting, and lined with matchboarding covered with Cannon & Hall's distemper.

No. 80. 4-inch timber framing covered with insulating paper and weather-boarding.

No. 85. 6-inch concrete and timber.

The all-important question, however, and the one which it was the object of this exhibition to solve, is that of cost. Can a cottage of the type of No. 14 (prize winner) be built for a prime cost of 150*l.*? Here again the question of locality comes in. At Letchworth, as will be seen by the schedule below, building materials appear to be very cheap, especially bricks; and this, no doubt, accounted for the fact that the judges report that they are satisfied that this cottage has actually been erected for the stipulated amount, which in this case works out at 3½*d.* per foot cube, the cubical contents being 10,272. This is a low price even under favourable circumstances, but it is higher than the cost per foot cube of the most recently built of Lord Carrington's cottages; so that there is some reason for believing that it is possible to erect a cottage, or at all events a pair of cottages, for something near the stipulated amount. The information which Lord Carrington has made public with reference to the actual cost of his cottages, under the conditions of ordinary contract working, is certainly most encouraging.

Schedule of Prices of Materials and Labour at Letchworth.

		Delivered on Site.
Fletton bricks	per thousand	£1 4 0
Sifted sand	per load	4 0
Local red tiles, sand-faced	per thousand	1 11 6
9-inch red tile quarries	per thousand	3 5 0
Wages—		
Bricklayers	8*d.* to 8½*d.*	per hour.
Carpenters	8*d.* to 8½*d.*	do.
Masons	9½*d.*	do.
Plasterers	9*d.*	do.
Painters	6*d.* to 6½*d.*	do.
Labourers	4½*d.*, 5*d.* and 5½*d.*	do.

As to By-laws.

The cottages at Letchworth have been built under the rural by-laws of Hitchin. These are practically the model rural by-laws of the Local Government Board. Under these there are no stipulations as to the materials or thickness of external walls (except as regards basements); consequently, ordinary timber and framing, thin concrete or plaster slabs, plastering on expanded metal, and, in fact, any material, however thin or poor or unsuitable, can be used in building these cottages.

There are, however, in these by-laws important regulations as to concrete over damp areas, damp-courses to walls, copings to parapets, open spaces at rear of buildings, provision of suitable windows, ventilation under boarded floors, ventilation of rooms, drainage, water and earth closets, ash-pit, cesspools and submission of plans to the local authority.

The result of this freedom in relation to wall construction has been that a large number of cottages have been erected under these by-laws with external walls which are neither durable, permanent, damp-proof or in any satisfactory degree capable of excluding the cold, to say nothing of the highly inflammable nature of some of the erections.

Strangest of all is the fact that the cottage which has obtained the first prize is a brick-built structure of a distinctly good and permanent character, which—except as regards, perhaps, the height of the rooms and a few minor details—could have been built under most of the so-called prohibitive by-laws of other urban district councils. This is a most interesting and instructive object-lesson, showing that these much-abused by-laws are not necessarily an obstacle to cheap (and good) cottage building.

What is really required is a more reasonable and intelligent administration of these by-laws, conceived in a sincere desire to assist rather than obstruct those who are honestly striving to do good work.

Everyone who has had much to do with building operations knows only too well how much depends upon the spirit and temper in which by-laws are administered. If the clerk of works or the foreman happens to fall out with the inspector, there will generally be trouble.

As to whether the erection of cottages as these under discussion can ever be remunerative as an investment is a question to be answered with difficulty. It does not appear that the agricultural labourer, as a rule, can afford even the 3*s.* a week rent which is the lowest rent that will pay any

Digitized by Google

appreciable interest on the capital expended, even when land is thrown in. If the building of these cottages could in any way be placed upon a sound commercial basis, the whole problem would be solved. But until that happy state is reached it would be well for those most directly interested to ponder over the weighty words of Lord Carrington in his letter to the *Times* :—

"I have, however, no doubt that indirectly a landowner who improves his estate by adding cottages to his farm does eventually get a very high rate of interest for his outlay. A farm without security of labour does not command anything like such a high rent as a farm on which there are cottages for the labourers. If a farmer has cottages on his farm he knows that he can always secure labour, and my experience is that a higher rent can in consequence be obtained for a farm with cottages, even though the cottages be let at a nominal rent."

Of course it is desirable that the landowner and not the farmer should be the owner of the cottages.

EDINBURGH ENGINEERING SCHOOL.

THE annual report relating to the University of Edinburgh says that substantial progress has been made during the year with the scheme for the "improvement and expansion of the University," and the engineering department has now moved into the new buildings in High School Yards. The plans for the new buildings were prepared in such a way that it was found possible to leave practically untouched the exterior walls of the old buildings, and this was particularly desirable in view of the fact that the front portion of the block (which is T-shaped) was originally the High School of Edinburgh. The ground floor of the head of the T, which faces west, is devoted to two laboratories, one for work on the strength of materials and the other for hydraulics, both fitted up with appliances of the most modern type. In order to secure an ample supply of water at a constant head for the hydraulic machinery, a water tower has been built at the south-east angle of the building, and at the top of this a 10,000-gallon tank has been put up. The first floor of this front portion of the building has been allotted to a large mechanics' laboratory, to the departmental library, and to the private rooms of the Professor and lecturers in the department. The workshops are on the ground floor on a site adjoining the old block of buildings, which has been roofed in and connected to the main block. The back block is also divided into two floors; the lower forms a large lecture theatre, with the necessary cloak-rooms, apparatus-room, &c., and the upper floor is given up entirely to the drawing-office. The lecture theatre has been fitted up for experimental demonstrations, and with all the needful arrangements for darkening the room in order to allow of the free use of the electric lantern. The drawing-office is a fine room, lit entirely from the north and east, and provision has been made for instruction in the various photographic methods employed by engineers for reproducing engineering drawings. As already intimated, the University has also secured ground for the erection on an adjoining site of new buildings for the Natural Philosophy Department, and building operations will be begun early in the year.

TESSERÆ.

Byzantine Ornament.

IN many ways the present art movement is similar to that which brought Byzantine architecture to life and remodelled all Classic ornamentation at the beginning of our era. Then, as at present, among a great commingling of races, a new and freer life had begun, which had its say in a fresh and logical architecture, in the splendid colouring of mosaics and in exuberant and fanciful ornament. Variations of the old designs were made necessary by the new shapes of arch and dome and pendentive, but not less by the quickened feeling for a truth and power and grace that all could understand, and which, as much as any religious need, had produced the new forms of building themselves. The novel designs of the Byzantines show a closer and keener observation of nature than that of the ancient Greeks or Romans. The acanthus foliage of the capitals, from the soft and graceful ornament of the Greeks, became crisp and sharp, like the stronger variety of the plant. The rolling scrolls, borrowed from the Romans, were given life, growth and variety. The vine especially (its significance in Christian symbolism made it specially important) became more like the natural vine than it has ever been before or since in decorative work. The grapes and the large leaves the Byzantine workman was interested in, both for their symbolic meaning and their decorative appearance; but the long bare coils of brown stem and the sudden bursting out into leaves and tendrils which are characteristic of vines in general, these were still more to his purpose, and he was more earnestly bent upon reproducing them in his work than upon giving exact representations of foliage and fruit. His barren lengths of stem he needed to frame in the lanky figures of his saints; the luxuriance of grape cluster and leaf and tendril served to fill the blanks between them. The resulting ornament is more like nature than the soft and regularly-foliaged vine-forms that preceded it. And it was the attention which the designers of early Christian times gave to the development of their own superior principles of elasticity and strength in construction that opened their minds to the perception of the same qualities in nature and enabled them to make such excellent use of natural forms in their decorations.

West Country Churches.

The Dorsetshire churches approach the Somerset type in the bodies of the buildings, but in respect of the towers are certainly not so fine, though of the same great period—the Perpendicular. The low-pitched, lead-covered roof, with its tie-beams filled in with rich tracery above, and the panelled parapets, are characteristic of both counties. Progressing still further west the county of Devon is reached, where, as a general rule, the churches are smaller and less interesting. The grand tower also to a great extent disappears. But there are several points of similarity to those of Somerset, viz. the waggon-headed ceiling with its carved bosses, the richly panelled or carved bench ends and the rood-screens, often painted. In freestones used in building Devon is not so rich as Somersetshire either in extent or in variety. Beer stone, of which Exeter Cathedral and many other fine buildings are constructed, is the most important. Granite is also used, and naturally has had the influence of making plain churches, while in the neighbourhood of Plymouth the celebrated marbles are quarried, which, however, have not had much effect on the architecture of the Middle Ages. In the north-west part of Somersetshire a peculiar type of small carved capital is seen, exceedingly like that of Devon, generally of late fifteenth or even sixteenth-century work. Sculpture figures of angels to each cardinal point of the capitals frequently occur, each bearing emblems of the Passion, or perhaps some musical instrument. The Cornish churches have several points of resemblance to the Somerset. The earlier ones were cruciform, built of sandstone; the later ones, erected during the same period, when so many Somerset ones were commenced, are built of granite. In plan the normal fifteenth-century Cornish church takes a considerable departure, and is certainly monotonous. Their span-roofed aisles of nearly equal width, prolonged from the west to the east (the latter with walls frequently flush the whole width), constitute a plan not equal to the more usual Somerset type. Indeed, the lead-covered aisle roof of low inclination, with parapet, affords more variety than the compass-shaped roofs with eaves of many of these Cornish churches. The nave and the chancel being generally under an unbroken continuous roof, the effective feature of a chancel arch is wanting, though its place is to some extent supplied by an oak rood-screen.

Eagle Lecterns.

There can be no doubt that, previously to the Great Rebellion, most village churches possessed their own eagle desk or lectern, whence the lessons were read to the people. In some instances they were made of brass, in others of wood, and eagles were most usually adopted as symbolising the angel flying "through the midst of heaven, having the everlasting gospel to preach." Those beautiful church ornaments were in many cases destroyed during the Civil War, and those which then escaped and those which have been made since are alike disused in too many instances now. Perhaps the most beautiful brazen lectern in England is that which belongs to King's College Chapel. It was the gift of that Provost Hacombleyne who has a brass in a south chantry of that chapel, and is alike admirable for the boldness and the delicacy of its ornaments. Another fine brazen lectern is to be seen in the cathedral church of Wells.

Digitized by Google

It was the gift of Dean (afterwards Bishop) Creyghton, one of the confessors for the Church during the Great Rebellion, and was an offering in token of thankfulness for the king's restoration. This lectern is now disused, and being placed in the middle of the nave considerably impairs the effect of that unrivalled vista by diverting and stopping the eye in its progress to the altar. There is a fine lectern in Ramsey Abbey Church, and one of Early English date in the church of Bury St. Edmunds. The latter now serves as the clerk's desk. The remains of a fine wooden lectern in Bridgwater Church are used for the same purpose. There are two very fine eagles in Southampton, neither of them now in use. The one which is represented as trampling on a serpent, and has its stem supported by four lions, belongs to Holyrood Church; the other, which is somewhat plainer, to St. Michael's. There was formerly a fine eagle in the cathedral church of Bristol. It was sold by a late Dean for the purpose of being melted down, though it is but fair to add that the proceeds were devoted to the restoration of the fabric. An inhabitant of the city rescued it from this desecration and presented it to the church of St. Mary-le-Port, where it now lies useless. In this case, as in that of St. Mary Redcliffe, Bristol, which has a fine eagle not now in use, steps have been taken with a view to their restoration. In Trinity Church, Coventry, is an eagle which formerly belonged to that cathedral, and was dug up on its site. It is in use, though, contrary to primitive custom, it faces the east, and the prayers are read from it as well as the lessons. Monksilver, Somersetshire, has a wooden eagle, which appears after the Reformation to have been used instead of the reading-pew, a hole being cut in the rood-screen to enable the people to hear with the greater ease, as the eagle is on its eastern side. These wooden eagles are far more common abroad than in England. A substitute for these is the wooden figure of a deacon holding the volume in his hands, the ludicrous effect of which must be seen to be appreciated. It appears from the accounts of Trinity College, in which an item occurs of a payment "for cleaning the brasse deske," that one, probably an eagle, once belonged to the chapel of that Society, but nothing is now known of its existence. The manner in which this disappeared, as traced in the accounts, is very curious and instructive. From 1580 to 1710 a distinct payment to different servants appears among the Extraordinaries for "skowering" or "looking after the brassen deske." But in 1711 it appears for the first time under the head of "constant allowances," coupled with another item, by that time probably considered more necessary, thus:—"For looking after the charcoal and cleaning the chappel deske, 4*l.* 12*s.*" And so it goes on till 1722, the two sums of 4*l.* which had been paid for looking after the charcoal, and 12*s.* for cleaning the desk, being now paid in one sum to a person who probably had only the first office to perform. For in 1722 "the chappel deske" is transformed into a very suspicious "&c." thus:—"For looking after the charcoal, &c., 4*l.* 12*s.*" And so it goes on to 1758, when even this little memorial disappears, and the whole 4*l.* 12*s.* is paid "to H. Gordon for making the charcoal fires." The precedent is still kept up. In 1841 "to W. Kemp for lighting the charcoal fire, 4*l.* 12*s.*" And this is the way that vanish and disappear from college chapels, as well as parish churches, "brassen deskes," "altar candlesticks," and other "&c."

Christian Symbols in Egypt.

Among all the traces which the hand of succeeding ages has left upon the sculptured walls and painted columns of the shrines at Philæ—traces of which few appear more vivid than the colours laid on in the Ptolemaic time—none have so deep and melancholy interest as the Christian symbols which give token before what power it was that the old Egyptian idolatry fell at last. It is true the Persian fire-worshipper had overturned, and rent, and shivered temples and images; but all in vain. He who shattered the Persian power, the Macedonian wild goat, was tamed by the cold, stony glare of the world-old colossal gods of Egypt, and the very horns upon his shaggy forehead, straight and sharp as a Macedonian sword-blade, curled and curved into the twisted ornaments of the sheepish countenance of a solemn criosphinx. Alexander became the son of Amun. Greek religion and Greek art alike, when, in company of Greek despotic dynasties, they had come back to their cradle again, did, as might do the sons of some prim, old-fashioned family, who, returning with new-fangled dress and notions from long foreign travel, should, for filial reverence, cramp thought, mince speech, and cut their cloth to the fashion of the antiquated household rules once more. Rome did little else in turn, and though among Egyptian ruins a round arch of Roman span uprears itself in places, and though upon the walls of a certain building at Luxor, between the great portico and the Temple of Isis, paintings have been uncovered of Roman type, yet hawks, and rams, and owls, and ostrich feathers—the snake, the goose, the scarabee—come still together, in varied combinations, to form cartouches, which record the names of an Augustus or an Antonine, a Tiberius or a Trajan, upon shrines where Kneph, and Pasht, and Horus still preside. Nay, as we have learned from the biting verse of the satirist soldier, Osiris and Iris had invaded the capital of their invaders, and the proud Roman matrons of the latter day had stooped to the foreign superstition that lustrations, for which the yellow waters of Father Tiber were all too impure, must be performed with the not more limpid waters of the browner Nile. But on the pillars of deserted Philæ, as on those indeed of Karnak's more gigantic pile, the simple crosses carved upon the stone tell of a different tale. Those graven crosses on the pillars, as the mark of the forest lord upon the forest trees, told their doom; and, uncut as they still remain, those trees, we know, were felled. Egypt was Christian from Pelusium to Philæ; ay, and yet far beyond.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A GENERAL meeting was held on Monday last. Mr. Edwin T. Hall, V.P., was chairman.

The Chairman moved:—"That the Council be instructed to enter into negotiations concerning a site for new Institute premises and to report to a general meeting." Mr. John Slater seconded, and it was carried unanimously.

The following Fellows were elected:—Messrs. Reginald Blomfield, A.R.A., M.A.Oxon., F.S.A.; Walter Cave, Howard Chatfeild Clarke, Robert Burns Dick, William Hawke, Gerald Callcott Horsley, Benjamin Septimus Jacobs, Professor William Richard Lethaby, Edwin Landseer Lutyens, Mervyn Edmund Macartney, William Cecil Marshall, M.A., Edward John May, John Howard Morgan, Ernest Newton, Segar Owen, Ambrose Macdonald Poynter, Edward Schroder Prior, Halsey Ralph Ricardo, Charles James Tait, Robert John Thomson, Thomas Harrison Thorpe, William Turnbull, Hugh Thackeray Turner, F.S.A., Edward Prioleau Warren, F.S.A., Louis Alfred Westwick, Francis Albert Whitwell and Walter Henry Woodroffe. *As Associates*:—Messrs. John Archibald Lucas and William Dathy Quirke.

Correspondence

Islington Library Competition.

SIR,—I have read a paragraph in your issue of January 5 relating to the action of the President of the Royal Institute of British Architects in the selection of competitors for and in assessing the Islington public library competition. I have no hesitation in saying that the statement does not accord with the facts, and that the inferences apparently intended to be drawn are absolutely without foundation.

I shall be obliged by your publishing this letter in your next issue.—Your obedient servant,

ALEXANDER GRAHAM, Hon. Sec. R.I.B.A.

Carlton Chambers: January 9.

Re the Imperial Royal Austrian Exhibition.

SIR,—By a cable message from India His Royal Highness the Prince of Wales has been pleased to intimate that he will give his immediate and generous patronage to the Imperial Royal Austrian Exhibition to be opened in London on May 1. Shall I be asking too much if I beg the hospitality of your columns for the announcement of this fact, for the mention of a few particulars concerning the objects of this Exhibition, and for an appeal to all your readers who may be interested in those objects?

The Exhibition has been planned under the presidency of His Excellency the Imperial Royal Austrian Minister of Commerce, with the purpose of demonstrating the resources of Austria and the possibilities of her export trade, and of emphasising and consolidating the commercial and social relations of your country and my own. The Right Hon. the Lord Mayor of London has accepted the hon. presidency

Digitized by Google

of the advisory committee in London; H.S.H. Prince Schönburg-Hartenstein, councillor to our London embassy, is president of this committee, and the list of vice-presidents contains a number of distinguished names, headed by that of Baron Alfred de Rothschild.

All the principal firms in Austria will exhibit, and the smaller manufacturers and smaller industries will be represented in the space reserved for the exhibit of our Ministry of Commerce. The exhibition will not only be typical of Austrian industry, but also of art and travel, and a leading feature will be a panorama representative of a journey through Austria illustrating the natural beauties of my country, while another section will be devoted to the spas and watering-places of Austria—Marienbad, Carlsbad, &c. A Tyrolean village will likewise be erected, and we shall build a Viennese theatre in which some of our most celebrated orchestras will be heard. May I add that I shall welcome the co-operation and suggestions of all who are interested in the amicable relations which exist between England and my country?—I am, Sir, your obedient servant,

G. Sizzo-Norris (Count),
Acting Austro-Hungarian Consul-General.

Laurence Pountney House, E.C.:
January 8, 1906.

Cement Works for South Africa.

Sir,—In "Notes and Comments" in your valuable Journal you state that the freights for cement into South Africa are almost prohibitive.

The writer, who is a thoroughly practical cement expert and engineer, who has erected large works in this country and paying large dividends, would be willing, if the merchants or capitalists would find the capital, to go out and erect works in South Africa on the most up-to-date system to pay first-class dividends. Paving slabs and reinforced concrete works could be established. Also I shall be glad to send any particulars as to cost of erection. Who will interest themselves in a work of this kind?—Yours faithfully,

W. Waterhouse.

Cambridge: January 3, 1906.

Caisson Construction.

Sir,—Reading the article by your New York correspondent on Mr. F. H. Kimball, in which it is suggested that problems which never before claimed the attention of architects by sinking caissons through treacherous soil were first introduced by Mr. F. H. Kimball about 1897, I should like, without disparaging Mr. Kimball's invention, to say that it is some thirty years too late to make such a statement or to claim that it had never before obtained the attention of architects.

Personally, I lay claim to the invention and its use when I was a principal in the office of the late eminent architect, Thomas Henry Wyatt, of Great Russell Street, London. I had to take charge of a difficult matter which arose at the Earl of Denbigh's mansion, "Newnham Paddox," where a very extensive addition had to be made to the already large mansion. At the commencement of operations it was found that the site was deep quicksand and most treacherous, so much so that it was not thought by many possible to build on the site without endangering the existing buildings, owing to water under the whole area.

Consultations with the most eminent men of the day, engineers from Great George Street, &c., took place at Great Russell Street. No feasible plan could be formulated that the contractor, Mr. Bromwich, of Rugby, would carry out; rather he would decline the contract, which amounted to over 20,000*l.*; but he said if Mr. Pope's principle was adopted he would undertake the contract and take all responsibility. "Mr. Pope's" proposal (Mine) was sinking caissons or drums to a solid bottom and filling them with concrete, by which they acted as piers to carry the superstructure. The system was adopted and carried out with great success; no settlement of any kind took place, to my knowledge, up to the present time. The work was done in the years 1876 and 1877. Some years after caissons were used for bridges and other works in touch with water. How far those gentlemen of Great George Street and others used or transmitted the idea I am not prepared to say, but I do say that it was I who invented and used the system in 1876, with the consent, approval and appreciation of the late Thomas Henry Wyatt. America is not always the pioneer, though perhaps well to the front, in laying claim to and appropriating ideas. We who know think little of what we know. Perhaps you will find something in this letter that will be of public interest.—Yours truly,

Henry Pope.

32 Dacre Road, Hitchin, Herts:
January 7, 1906.

GENERAL.

Mr. H. M. Cundall has been promoted to the senior keepership of the Victoria and Albert Museum, Art Division. He has for many years been attached to the art section at South Kensington, and has been responsible for the arrangement of the national competition exhibits, as well as for special shows like the Morland and those dealing with various phases of engraving.

The Institution of Heating and Ventilating Engineers will hold their annual general meeting on Tuesday, the 16th inst., at the Hall of the Institution of Mechanical Engineers, Westminster, at 7 P.M.

The Discussion on Mr. F. B. Hollis's paper, read before the Quantity Surveyors' Association, entitled "Some Thoughts on the Quantity Surveyor and his Relation to the Building Owner, the Architect and the Builder," will be resumed at the Holborn Restaurant on Wednesday next, at 7 P.M.

Messrs. Chancellor & Son, of Chelmsford, inform us that they are the architects for the secondary school, Braintree.

The Exhibition of the Arts and Crafts Exhibition Society will be open next week at the Grafton Gallery. The private view will be held to-morrow (Saturday).

The Church of St. Nicholas, West Bolton, Sunderland, which is supposed to date from 1220, was seriously damaged by fire on Monday.

The Committee of the National Art Collections Fund have notified that they have been unable within the limit of time granted by Messrs. Agnew to raise the full sum necessary to secure the Rokeby Velasquez for the nation. The total amount promised was 20,000*l.*

A Variety of the specimens of Roman pottery, beads and ornaments, found at the Roman baths in Penydarren Park have been arranged and deposited in the Merthyr town hall. The relics date from the latter part of the first century up to the end of the Roman occupation. In another part of the park there have been unearthed the foundations of an extensive granary, such as generally formed part of a fortified camp, and there are many indications that there was at one time an important Roman settlement on the spot.

The Holborn Borough Council have been recommended by a sub-committee to oppose the General Powers Bill of the London County Council in respect of the provision empowering the Council to provide buildings for exhibitions of works of art, &c. Having regard to the increasing financial burden on the ratepayers of London, the committee expresses its hostility to the granting of a general power of this nature without any financial restrictions.

The Liverpool Cathedral executive committee at a meeting on Monday were informed that the total subscribed for the purpose of the cathedral now reached the sum of 250,000*l.*, while the amount required for the completion of the first portion of the building was 340,000*l.* The clerk of works reported that the foundations would be completed at the end of February, within the contract time, and arrangements were made for obtaining tenders for the erection of the main building.

Mr. William H. Thorp, architect, has removed his offices from No. 61 Albion Street to Phœnix Chambers, South Parade, Leeds.

The Proposal to invite six architects to compete for the offices of the Holborn Borough Council was on Wednesday referred back for further consideration.

The Irvine Dean of Guild Court have passed plans of a school which the Burgh School Board proposes to erect at a cost of 7,000 in Cochrane Park. The new building is to be of two storeys, built of white sandstone, and will accommodate 600 children. The classrooms for the lower classes are to be situated on the ground floor along with cook and laundry classrooms and a central hall suitable for drilling children in, while the upper storey will be devoted to the work of standards two, three, four, five and six. Low-pressure hot-water pipes are to be fitted throughout the building for heating purposes.

The Architect.

THE WEEK.

IT is usual in drawing up a submission to arbitration to fix the time for making the award, which can, however, be enlarged under a rule of Court, or by agreement between the arbitrators if two are employed. The consequence of being a single day behind the time agreed upon was exemplified on Monday in the Irish King's Bench Division. Messrs. GREGG & Co., timber merchants, brought an action against a firm of timber exporters in Canada in respect of the quality of timber. It was to be supplied in three shipments and delivered in Belfast in July, September and October, 1904. As the shipments received in July and September were declared to be not in accordance with the terms of the contract, the question was referred to arbitration. The defendants were ordered to pay 690*l.* The shipment arriving in October was likewise refused on account of its quality. The arbitrator's award was found to be a day in arrear, and no apportionment was made in it between the two shipments, although it was alleged that each was equivalent to a separate contract. The case was then brought into Court, and the action was tried in Belfast. The jury assessed the damages in respect of the first shipment at 230*l.*, and 460*l.* for the second, the total amount corresponding with the arbitrator's award. The damages on account of the third shipment were assessed at 105*l.* The Chief Baron, however, entered judgment for the defendants on the ground of the informality of the award, and it did not apportion the parts for each shipment. Application was made for a new trial, or that the judgment of the Chief Baron should be set aside and judgment for 795*l.* and costs should be entered for the plaintiffs. The Court, consisting of the Lord Chief Justice, Mr. Justice MADDEN and Mr. Justice WRIGHT, unanimously affirmed the judgment of Chief Baron PALLAS. Never was the necessity of having awards presented in a rigorously correct form more remarkably demonstrated.

A MEETING of the Architectural Section of the Royal Philosophical Society of Glasgow was held on Monday, when a paper on "Mortar" was read by Mr. SAMUEL SMITH, clerk of works at the Technical College. That building stands on the site of the Andersonian University, which was probably the earliest technical college in Great Britain. The founder was a professor of natural philosophy in the university, and he felt it part of his duty to visit workshops in order to see the practical applications of science. All he possessed at his death he left for the instruction of artisans and others. Mr. SMITH was able to exhibit specimens of the mortar used in the foundations of the building. On analysis this mortar was found to be composed of one part of Roman cement and one part of sand. This mortar was in a perfect state of preservation, while the ordinary Scotch lime mortar used for the rest of the building was friable and rotten. Mr. SMITH was of opinion that this mortar was prepared in 1836, nearly seventy years ago. Another sample shown was a piece of mortar composed of one part Arden lime, one part engine ashes, and one part freestone shivers, ground together in a mortar mill. This, to judge by the sample shown, made a first-class mortar. The subject has importance, for there is a misgiving that in Glasgow defects are not unusual in modern buildings.

THE crime of arson has always been looked upon as one of the most serious which can be committed. By English law, however, a curious distinction was made, viz. that the house must belong to another person than the perpetrator. To burn one's own house, especially in a town, was only a misdemeanour. Early in the late QUEEN'S reign a great change in the old law was introduced, and it was declared to be a felony to set fire to a dwelling-house, a person or persons being found therein. It is easy, therefore, to understand why Mr. CLUER, the magistrate at Worship Street, should hesitate about committing a prisoner for felony or for misdemeanour. The man was charged with feloniously setting fire to a dwelling-house. As a fact, he was no more than an occupier of a part of a model dwelling in Bethnal Green. It was alleged that he had set fire to clothes and other materials in the room he rented, but he claimed that he could do what he liked with his own goods. There is no doubt his flat was a dwelling-house, but he was the only occupant of it. It could not, therefore, be said that there were other persons present when the dwelling was set alight. When the Acts relating to the subject were created model dwellings did not exist, and a great part of the provisions relate to farm-buildings, hay, straw, wood, &c. Mr. CLUER left it for a judge to decide, and the prisoner was, therefore, committed both for arson and for the setting fire to his own goods to the danger and injury of his neighbours.

IT is often difficult to account for the loss of interest in various parts of Paris. It seems to be a law that population, or the wealthiest part of it, must move westward, and the old districts fall into the hands of people of a different class. This remarkable variation seems so much of a law that some people consider the old Quartier Latin would lose its character if it were not for the number of educational institutions which are to be found there alone. The Municipality of Paris wish to convince the citizens that the districts which are deserted by the people of fashion are still possessed of much artistic interest. On Monday an exhibition was opened in the Petit Palais which consists of photographs from two of those waning districts, viz. the Marais and l'Ile Saint-Louis. Many of the big mansions in the Marais are now utilised as workshops which are connected with the production of *objets de Paris*. The earlier stages may be gone through elsewhere, but much of the delicate work in jewellery, bronzes, &c., is performed in rooms which at one time were occupied by people of rank. Notre-Dame and the Morgue generally terminate the excursions which visitors to Paris make on the eastern side. L'Ile Saint-Louis is further eastward, and it still contains residences which almost deserve to be described as palaces. The photographs will be a revelation to many people who live in Paris, and they afford architectural studies of great interest. The exhibition will be open for a month only.

THE latest report of the Royal Museum at Berlin is an important document, for it is evidence of the efforts which are made to secure collections which will exemplify a great variety of artists' work. Importance is attached to the portrait of Sir JOSHUA REYNOLDS by himself and to a landscape by RICHARD WILSON. From England was also obtained an early example by MURILLO, an *Adoration by the Shepherds*. A fragment of a Byzantine relief representing the history of JOSEPH came from Constantinople. From an English collection was derived a fine lunette by LUCA DELLA ROBBIA representing the MADONNA between Angels. It dates from 1450. Another example has for subject the Blessed Trinity. There are several examples of painted wooden statues. From Miletus casts of sculpture were obtained. A collection of no less than 593 specimens of Arabic glass has been presented by Professor MORITZ of Cairo. Another present is a collection of weapons and ornaments of North American Indians, as well as several water-colour drawings and sketches depicting their ordinary life. This brief abstract is enough to show the comprehensiveness of the museum, and in a short time it will not be necessary for Germans to travel beyond Berlin when in search of fine art or industrial arts.

JACQUES LOUIS DAVID.

EVERYONE knows of the custom prevailing in the French Academy by which it is incumbent on each new Academician to deliver an eulogium on the member to whose chair he succeeds. On Thursday of last week it therefore happened that M. ETIENNE LAMY, who is a politician and was once a minister, should endeavour to draw the character of EUGÈNE GUILLAUME, the sculptor, and for many years the director of the French School at Rome. It was generally known that M. LAMY could only have taken as much interest in the arts as the average French gentleman. But in the Academy literary rather than technical knowledge is desirable. The Academy was established to uphold a standard of language by which French literature would be preserved against foreign innovations, and M. LAMY as a champion of tradition found little difficulty in demonstrating that in what are known as the Fine Arts it is desirable to have the same sort of reverence for the past which the Academy is supposed to exemplify in respect to writing and talking.

EUGÈNE GUILLAUME was an extremely fastidious artist, and in consequence of the difficulty of reaching the high standard to which he aspired he left very few works which will enable posterity to judge of his merit. M. LAMY referred to one instance. Judging by the quantity of copies of CANOVA's bust of NAPOLEON which appear every season in London sale-rooms, it might be supposed that the head was easy to produce. EUGÈNE GUILLAUME, wishing to realise his own idea of NAPOLEON, made no less than eight attempts. But he was satisfied with none of the busts. His failure with the head, of which French artists have a very definite idea, was enough to suggest the difficulty of reconciling tradition with modern ideas.

For more than a century many French artists have given up a similar task and have endeavoured to follow new lines. DAVID, the painter, was one of those innovators, and it can scarcely be said that his influence is of no account in modern times. M. LAMY considers that his Jacobinism was not confined to politics, and that his political fury inspired his fanaticism for antiquity. DAVID believed that the two peoples by whom citizens were most appreciated were able to produce the most perfect figures of men and women, and it is to the ancient artists moderns should go for the highest examples of art. According to M. LAMY, DAVID was not the first revolutionary who broke chains in order to forge them into others which would be heavier.

It is the fate of every great artist to have his characteristics put under the microscope, and slight faults in consequence are magnified to a remarkable degree. DAVID has, moreover, the disadvantage of having been a revolutionary, a member of the Assembly which voted the death of LOUIS XVI., and of having sacrificed his principles so as to gain the favour of NAPOLEON. It is hardly fair to condemn enthusiasts who lived in Paris in the time of the Revolution. Poets and artists believed that a new era was coming in which ability was to prevail. WORDSWORTH, COLERIDGE and SOUTHEY were staid Englishmen, and yet all three championed the French Revolution. DAVID was born in 1748; he had, therefore, passed his fortieth year when the Revolution began. But he had attempted some years before a revolution of his own in painting. He was a grand nephew of BOUCHER, whose works had special attraction for many of the grandees of the time. But DAVID, who was an orphan, was placed by his uncle not in the painter's studio, but in an architect's office. The influence of that short period of his training on his future works is unmistakable, although EDMUND DE GONCOURT is the only critic who has noticed it. The "anatomies" of DAVID, he remarks in his "Journal," are not the drawings of a painter, they are the diagrams (*épures*) of an architect. Indeed, THACKERAY, in describing DAVID's heroic work, made use of printer's rules or lines in order to suggest the attitudes of the figures. Apparently DAVID grew tired of making geometrical drawings, and sought to become a pupil of his relative. BOUCHER, however, sent him to VIEN, who afterwards became the Director of the French Academy at Rome.

At the time there were two influences at work in painting. One was academicism, which favoured only high art. The other was the regard for everyday life which GREUZE and CHARDIN had shown, and which DENIS DIDEROT had advocated. VIEN endeavoured to follow a middle course by imparting to modern figures some of the grace and dignity of the antique, and his compromises are unknown. DAVID preferred the former, and in 1771 he competed for the Prix de Rome with *The Combat of Minerva against Mars and Venus*, which was not successful. Four years later he gained the prize with his *Antiochus and Stratonice*. That he was not indifferent to reality is evident from the portrait of himself, which represents him as he appeared between the two compositions, and which, like his later portraits, is remarkable for its simplicity and apparent accuracy.

About the time when he visited Rome ancient art was studied under new aspects. WINCKELMANN's works had appeared. LESSING had demonstrated the difference between poetry and sculpture, and RAPHAEL MENGS had described in detail the qualities of the principal painters. DAVID set to work according to the prescribed rules by making copies in the Vatican. It is, however, strange that after his return to Paris in 1780 he produced, instead of a classical scene, an incident in the life of St. ROCH, as if he anticipated commissions for paintings to be set up in churches. About that time the thoughts of men were being directed towards the constitution of society in an earlier era, and especially in Greece and Rome. It is remarkable as indicative of the notions which were then abroad that the Director-General of the Royal Buildings gave DAVID a commission for two paintings from Roman history, viz. the *Oath of the Horatii* and the *Lictors carrying the Body of his Son to Brutus*. The Comte D'ARTOIS, the king's brother, also ordered the *Amours of Helen and Paris*. If such subjects appear foolish to us it should be remembered that a host of authors had familiarised them by their writings. Most of the tragedies which were seen on the stage were inspired by Graeco-Roman themes. The paintings which DAVID produced were nearly all derived from antiquity. Between 1785 and 1789 he was recognised as the principal painter in France. The people accepted his pictures as if they were historical treatises, and in looking on them they imagined they were brought nearer to the heroic days. The history of the French Revolution reveals to us that for some time before the taking of the Bastille there was a ferment in Paris. It was a time of attitudinising, and in no collection of paintings could so many stilted attitudes be seen as in those of DAVID. If he was a factor in many of the events there is no doubt they operated upon him in return. DAVID revealed a new phase of his talent when he began to paint revolutionary scenes. In representing the taking of the oath in the ball court at Versailles he had a memorable subject, and people were surprised by such an approach to realism. But the strange thing is that owing to the precedents he set by his Greek and Roman scenes, nobody can believe that the Deputies over whom BAILLY, the astronomer and mayor of Paris, presided, went through the solemn act in the manner shown by DAVID. There were two other scenes in which he was more restricted and which are therefore likely to be more accurate. One is the *Death of Marat*, which he offered to the Convention, in which he introduced the bath and the sordid accessories of the terrible veterinary. Another picture was the *Death of Lepelletier*, a member of the Convention, who was killed by one of the royal guards.

It is inexplicable that a man who was a realist was unable to recognise the limits of his powers. What was worse, during thirty years he endeavoured to compel a multitude of young artists who entered his

Digitized by Google

studios to believe that antique subjects alone were worthy of the pencil. And yet by one of those anomalies which are so often found in able men, he used all his power with his fellow legislators to suppress the French Academy of Art, which had done so much to keep artists in what may be called a classical groove. It is no wonder he was called the tyrant of the arts, and probably the reason for his enmity against the Academy was that it prevented him from having despotic control, over painting at least. As long as ROBESPIERRE held sway DAVID apparently could give his ill-nature, which he called patriotism, full license. But when the deputy for Arras fell, DAVID found himself in the prison of the Luxembourg. It speaks well for him that his pupils demanded his release, and refused to accept any other teacher. He was set free, and returned to his art with renewed energy, in the hope that he would at length make the antique supreme in art. Yet, strange to say, M. ETIENNE LAMY considers DAVID to be an innovator rather than an upholder of tradition.

It speaks well for NAPOLEON'S insight that when he became First Consul he displayed a partiality for the man who had organised Feasts of Reason and other novel festivals. BONAPARTE seemed to think that the painter of Greek and Roman subjects had trained himself to serve for the representation of events which were forthcoming. He proposed that DAVID should paint his portrait. The artist wished his subject to pose for him, but the general thought that would be an absurdity, as he did not believe the great men of antiquity had done so. DAVID said he painted for contemporaries who would wish his work to resemble the original. BONAPARTE replied that resemblance did not consist in the exactitude of the features, but in the character of the physiognomy and the expression of the power animating it. DAVID said that the First Consul was teaching him his art, as he had never painted a portrait of that kind, and he promised that it should be done without any posing. The result was the picture of BONAPARTE mounted on a fiery steed which stands on its hind legs on the snow or ice, while the Consul appears to be addressing his men and pointing to the plains of Italy as if they were situated in the clouds. The work is an absurdity. BONAPARTE has recorded that he rode with difficulty a mule which the Prior of the Convent of St. Bernard had assured him was the surest-footed in the district. SAINTE-BEUVE, however, was of opinion that it was not DAVID who imagined the fiery steed in such a place, but that the idea came from the Consul himself. It is remarkable that the picture was accepted by Frenchmen as depicting a reality, and it was not until many years had passed that DELAROCHE ventured to represent the incident as it occurred.

The Alpine scene won for DAVID the appointment of first painter to the emperor after the termination of the Consulship. He received a commission for four great paintings, viz. the *Coronation*, the *Distribution of Eagles*, the *Enthronisation*, and the *Visit to the Hôtel de Ville*. The first and second were alone completed. In the *Coronation* it was not the Emperor, but the Pope, who appears as the principal figure. In the *Eagles* he intended to introduce symbolic figures among the clouds, but was not allowed. In other words, he could not get rid of reminiscences of old conventionalities.

The fall of the Empire compelled DAVID to seek refuge in Brussels. Many young artists followed him, for it was still believed that he was a great master. While in exile he continued his endeavours to dictate what should be done by French painters. He persevered with appeals to those who attempted to depict scenes which were the glory of Frenchmen of the time. To him PLUTARCH presented more fitting subjects for a painter than the volumes of the *Moniteur*, which recorded so many French victories. The works which he produced in Belgium do not redound to his fame. But it must be allowed that he had none of those incitements which were necessary for a man with such a history. He lived until the end of 1825, and his patriotism was proved by his rejection of the office of Minister of Fine Arts in the Prussian Government, which was offered to him, and which was a sign of the esteem in which he was held. Like NAPOLEON, he wished to be buried in a Paris cemetery, but the French Government would not allow the remains of the old regicide to cross the frontier. The incident was made the subject of one of BÉRANGER'S songs.

THACKERAY in his young days, when he was an art student in Paris, described DAVID'S large works as silly affectations and as "improvements" upon nature. According to him the man had a genius for painting portraits and common life, but must attempt the heroic and carry a whole nation blundering after him. THACKERAY believed it was the romantic young adventurers who issued from the castle of Abbotsford that overcame the heroes and demigods of Greece and Rome. Classicism succumbed to romanticism. In other words, all the rules and regulations which generations of artists had obeyed were set aside. But the hardest fate of all is to find that the latest French Academician is of opinion that the painter who believed in the classical dictionary as the *vade mecum* of artists should now be declared as no more than a Jacobin who inspired artists with disrespect for antiquity.

AN ACADEMY RECORD.*

WE have again to compliment Mr. ALGERNON GRAVES on the punctuality with which his fourth volume is delivered. Although the intervals between the volumes are so short there is no sign of haste, and, indeed, the appearance of the pages is satisfactory as examples of typography. Everything has been done to facilitate reference.

The new volume recalls on an early page the tragedy of BENJAMIN ROBERT HAYDON. He entered the Academy as a student in 1804, when he was in his eighteenth year. In 1807 he sent a Scripture painting, *Joseph and Mary resting with our Saviour after a Day's Journey on the Road to Egypt*. Afterwards he returned to Plymouth, his native place, where he painted portraits. In 1809 he exhibited his *Dentatus*, which subsequently gained him a prize of 100 guineas from the Royal Institution. About this time he quarrelled with the Academy, and it was not until 1826 that another work by him was seen. He exhibited also in 1827 and 1828, and then there was a long interval during which he was absent. He reappeared in 1842, 1843 and 1845. In 1846 he put an end to his life. There is no need to comment on his career. Sixty years have not demonstrated that HAYDON was a man of great genius. He was an enthusiast, and he helped to convince people of the value of the Elgin marbles. But his works are not more admired now than they were by his contemporaries.

It is curious that one of the first names in the volume is that of THOMAS HARRISON, the architect who induced Lord ELGIN to take an interest in the remains of the Parthenon, which afterwards helped to encourage HAYDON in the belief that through recognising them he was superior to the majority of painters. HARRISON found a patron in Lord DUNDAS and was enabled to live for several years in Rome. In 1773 he sent four architectural drawings, and in 1777 part of a design for the Piazza del Popolo, the principal entrance to Rome. In 1779 there was a design by him for a national monument to commemorate great public characters, and in 1814 he prepared "A national building to record by painting and sculpture the victories of the Marquis of WELLINGTON and the other commanders by sea and land during the present year." He erected several bridges, one at Chester having a span of 200 feet, and he sent two elevations of a bridge across the Thames to the

* *The Royal Academy of Arts.* A Complete Dictionary of Contributors and their Work, from its Foundation in 1769 to 1904. By Algernon Graves, F.S.A. Vol. IV., Harral to Lawranson. (London: Henry Graves & Co., Ltd., and George Bell & Sons.)

Digitized by Google

Academy. J. HARVEY in 1787 had a design in the Academy for the Menai bridge, with an arch of 400 feet span. Among his other designs were some for a national prison, a musical theatre, an observatory, a Parliament-house at Westminster, a shire hall, and a London Bridge of cast-iron. His son seems to have followed a similar line, one of his designs being an approach to a palace with bridge, observatory and boat-house. As we remarked in noticing the early volumes, architects towards the close of the eighteenth century were fascinated by temples, and, like GEORGE HAWKINS, were ready to devote them to Peace or to Jupiter. E. HAYCOCK appears as the author of a mausoleum, an academy of arts, a college and a Temple to Fame.

The late C. F. HAYWARD, who recently died, began to exhibit in 1825 with a design for a Venetian palace, water façade. The last time his work appeared on the walls was in 1894; it was a "Mansion opposite the British Museum." J. HAYWARD, of Exeter, exhibited between 1826 and 1855. HENRY HOLLAND, who was the architect of Dover House and of the portico of Carlton House, does not appear to have exhibited. But his nephew, RICHARD HOLLAND, is entered for four designs. THOMAS HOPPER found favour with the Prince of WALES. In 1807 he exhibited designs for a conservatory at Carlton House, and he erected several important buildings. In 1837 he had a design for the new Houses of Parliament, and in 1846 one, and probably the last, of those compound buildings which were intended to serve a great many purposes, viz. "To NELSON and his companions in arms; a design forming part of a series to combine in one group a gallery to receive annual prize pictures in commemoration of the brilliant victories achieved by British arms, a national gallery and exhibition rooms for the Royal Academy." HECTOR HOREAU, the French architect, was a rival of PAXTON in designing exhibition buildings of glass and iron. In order to prove his ability, a bird's-eye view of the most important building erected by him was hung in 1852. WILLIAM HOSKING was for a time Professor of Architecture at King's College, and became one of the official referees under the Building Act. He was only once an exhibitor in the Academy, in 1826, with a drawing of the "Temple of Juno Lucina at Agrigentum in Sicily, taken on the spot in April 1824." It may here be mentioned that Mr. ALFRED HUDSON, who is the legal member of the Tribunal of Appeal, exhibited some of his architectural work in 1877 and 1881.

The late E. I'ANSON, who was President of the Institute, began to exhibit in 1830 with a design for a church and cemetery. In 1837 he sent two views from Athens, but afterwards his subjects were mainly buildings in the City. W. S. INMAN proposed in 1821 the erection of a cenotaph to the three Presidents of the Royal Academy of Arts. But no admirers were forthcoming to supply the money.

The name of INWOOD is associated with the church of St. Pancras. It was the work of WILLIAM and HENRY WILLIAM INWOOD. In 1819 and 1821 six drawings of the building were shown. There were also views of a chapel in Regent Square, St. Pancras, Camden chapel and an Athenian Ionian garden temple for the Earl of ONSLOW at Clandon. WILLIAM INWOOD and HENRY WILLIAM INWOOD contributed other drawings singly, the latter sending a design for a garden seat when he was in his fifteenth year. CHARLES HENRY INWOOD and E. INWOOD were also exhibitors. J. IRELAND, who was an exhibitor from 1808, designed in 1818 a model of a Temple of Victory which was to commemorate Waterloo. The following description will suggest its character:—"The allegorical groups are ALEXANDER taming BUCEPHALUS, and HERCULES striking off the last head of the Hydra. Mottoes: Domitari tyranni, Victor tyranni. The interior is 100 feet in diameter; in the centre is a statue of the Prince Regent, grasping with his right hand a medallion of his royal father; opposite to H.R.H. is the hero of Waterloo surrounded by his brave companions in glory." It is fortunate that so few memorials of the war with France were carried out.

OWEN JONES was supposed to have sent only one drawing to the Academy. But several from his hand were to be seen, although it must be said few of his designs were carried out. In 1831 there was a design by him for the Town Hall, Birmingham. For nine or ten years he found more congenial work. In 1835, 1838, 1839 and 1840 the architectural room must have been attractive from his drawings of the Alhambra. In 1840 he also sent a design for St. George's Hall, Liverpool. In subsequent years his works were a villa, a dairy, a gallery and a ceiling, which are evidence that so able an artist was never recognised at his true value. HENRY E. KENDALL is credited with a large number of buildings. The late Professor KERR was the author of designs for such ambitious works as the Palais de Justice in Brussels and the Berlin Parliament-house. But his principal building was the mansion "Bearwood," for Mr. WALTER, of which there were three drawings. By JOHN THOMAS KNOWLES are a mansion at Silverton Park, a chancel at Reigate, and the Grosvenor Hotel.

In going through the pages one is struck by the large number of drawings of which apparently no use was made. During several years after the Academy was opened competitions were unknown, and architects were spared the losses which they involved. But a substitute was found for them by the architects themselves in designing Pagan temples, memorials of kings, warriors and statesmen, and, for those whose ambition was of a more modest kind, the furniture for rooms. People sometimes speculate about the fate of the paintings and the busts which were once exhibited and which have lost all interest. But for architectural designs, imagination cannot find any use. Speculative builders would decline to employ the greater part of the designs for mansions hung in the Academy. That does not, however, affect the value of Mr. ALGERNON GRAVES's work, which will be the most complete record in existence of the efforts made by artists in Great Britain.

PLANNING OF CREMATORIA AND COLUMBARIA.*

THE subject of provision for the disposal of the dead cannot be said to be one of the most pleasant that could be selected for a discourse. I venture to hope, however, that we shall spend an hour profitably in discussing the principles of planning crematoria and columbaria. It is refreshing to know that we shall be in good company in our contemplations; that men of literary capacity, such as Professor Rolleston, the late Bishop of Manchester, Sir Thomas Brown and Sir Henry Thompson are only a few of those who have used their pen and mind to further cremation. Their judgment will encourage us, and we may feel justified in using an evening of this Society's syllabus to discuss a subject upon which the architectural profession at present possesses little information.

Cremation, or the burning of human remains, was the general practice of the ancient world, with the exception of Egypt, where bodies were embalmed. In Rome, from the close of the Republic to the end of the fourth Christian century, burning was the general rule. The Siamese have a similar institution, according to which, before burning, the embalmed body lies in a temple for a period determined by the rank of the dead man—the king for six months, and so downwards. If the poor relatives cannot afford fuel and the other necessary preparations, they bury the body but exhume it for burning when an opportunity occurs. In our land the age of reason had its period; cremation was practised by the Druids and early English. Proof of this can be found in the British Museum, where there are many examples of unburnt clay urns which have been unearthed in various parts of the country.

* A paper read before the Society of Architects, London, January 18, by Albert C. Freeman (member), author of *Crematoria in Great Britain and Abroad*, &c.

After all that has been said upon the subject it remains a fact that, to the minds of some, the idea of reducing the human body to ashes by means of fire will be obnoxious. All the arguments and facts which may be presented to show the baneful effects of earth-burial may be admitted. It may be accorded that in far distant lands cremation may be necessary, but when the question is brought so near home as to embrace the possibility of subjecting one's own body there is a shrinking from the thought. Burial in the earth is a method of disposition with which all are familiar; if our minds come to consider the revolting process of inhumation, it is instantly put aside. Immediately, however, a new method is brought before our notice it is these features which first engage our attention.

After having seen the process of incineration I must say that my feelings are completely changed; the method of destroying the dead by burning is more decent than that of inhumation, and I would rather see the remains of my dearest friend cremated than buried in the earth. The re-awakening of the public mind to the importance of the subject of cremation was brought about by the late Sir Henry Thompson, in an article published in the *Contemporary Review* in 1874. In 1879 the Woking Crematorium was erected, but as the Home Office prevented its utilisation it lay idle for many years. In 1883 a cremation took place in Wales in defiance of the coroner's authority, followed by legal proceedings. These resulted in 1884 in the decision of Mr. Justice Stephens declaring that cremation was a legal procedure provided that it was performed without nuisance to others. In 1884 the House of Commons refused to pass a Bill for the regulation of cremation; the Cremation Society of England, however, backed up by the decision of Mr. Justice Stephens, opened the crematorium at Woking, and on March 20, 1885, it was used for the first time, the body of a lady being cremated. Since then crematoria have been erected at Manchester, Hull, Liverpool, Birmingham, Darlington, Leicester, Golders Green, Bradford, Headingley and Ilford.

The first crematorium erected in France was at Paris in 1889; since then three more have been erected. The first to be built in Germany was at Gotha in 1878; since that date eight others have been erected. Switzerland possesses four, the first being built in 1898 at Basel. In Denmark the first was provided at Copenhagen; in Sweden there are two, at Stockholm and Gothenburg. Crematoria in the United States date back to 1876, when Dr. F. Julius le Moyne, of Washington, erected a building for the future cremation of his own body, but to create an interest in the subject he permitted its occasional use. In 1884 the second crematorium was erected at Lancaster; the year following the New York and Buffalo Crematoria were erected. Since that time more buildings have been added, until now there are twenty-five at the service of the public. A crematorium was built at Montreal in 1902, and at Adelaide, Australia, in 1903. The first erected in Italy was at Milan in 1876, and since that date several others have been built, until now there are twenty-six in operation.

Practical Considerations.

Passing from the commencement of cremation to the practical side of our subject, "The Planning of Crematoria and Columbaria," we will first give a glance at the general principles. The Act for the regulation of the burning of human remains and to enable burial authorities to establish crematoria came into force in this country on April 1, 1903. The Act provides for the maintenance of crematoria and burial-grounds or anything incidental thereto, and that no human remains shall be buried in any crematorium until the plans of the site shall have been approved by the Local Government Board, and until the burial authority has given notice to the Home Secretary that the building is completed and properly equipped for the purpose of the disposal of human remains by burning. It also provides that no crematorium shall be constructed within 200 yards of any dwelling except with the consent, in writing, of the owner, lessee and occupier of such house, nor within 50 yards of any public highway, nor in the consecrated portion of any burial-ground of any burial authority. I might mention that Ilford Crematorium is erected in the consecrated portion of the cemetery, although the building itself remains unconsecrated.

In giving consideration to the question of the consecration of the ground, we will first glance at the Cemetery and Burial Grounds Act, from which it will be seen that a cemetery is not always consecrated. The statutes relating to the burial of the dead make a peculiar distinction between burial-grounds and cemeteries. The former are provided for under the Burial Acts, of which there is a series of twelve, dating from 1852 to 1885; the latter under the Cemeteries Clause Act 1847, in which it is stated, "A burial-ground must have a portion of it tendered to the Bishop of the diocese for consecration, but no portion of a cemetery need be consecrated." Although these buildings remain unconsecrated, I suggest that every one be planned with the head of the catafalque facing due east.

In the general arrangement of the plan it is of the utmost importance that due regard be given to the relative positions of the chapel and the incinerating chamber; and it must be remembered that the removal of the coffin and its transport to the crematory should be effected as far as possible without handling. Provision is generally made of a chapel, incinerating chamber, vestry and a waiting-room for the use of the relatives or friends who are anxious to remain until the body has been reduced to ashes.

Golders Green Crematorium.—This building, which was opened in November 1902, is the property of the Cremation Society of England. It is designed in the Northern Italian style, and may be said to be strict in treatment, depending on its breadth and proportion rather than upon ornament. Provision is made here of a chapel, which, including its gallery, is 70 feet long and 25 feet wide; a waiting-room and vestry are arranged beneath the gallery. The incinerating chamber adjoins the chapel; it is 62 feet long and 40 feet wide, with provision for four furnaces, two of which are at present erected. The internal walls of the chapel are panelled to the height of the doors, above which the arcaded brick walls carry an open-timbered roof. The columbarium here is about 22 feet square; it is a tower-like building with four storeys, having provision for the reception of 1,700 urns. It is proposed at some future date to connect this building and the chapel with cloisters.

Manchester Crematorium.—This crematorium comprises a hall or chapel about 50 feet long and 25 feet wide. Colonnades for the reception of urns are arranged on each side. On the inside wall of the hall niches are arranged for urns. The incinerating chamber, which is at the rear, has accommodation for two furnaces.

Liverpool Crematorium.—This building is an excellent example of a combined crematorium and columbarium. On the ground floor are arranged the chapel, waiting-room and incinerating chamber; under the chapel, and with direct access from it, is provided a columbarium, having three well-lighted corridors, on either side of which are arranged niches for storing urns. Some of these provide for one and some for three.

Leicester Crematorium.—This building stands in the Gilroes Cemetery, Leicester. It is designed in a Late Gothic style, and comprises two chapels, in size about 24 feet wide and 43 feet long, each having a chancel at the rear, 17 feet by 17 feet 6 inches. One is intended for inhumation services; the other, which is for cremation, has an oak catafalque. At the rear of the chapel is planned the incinerating chamber, which is 43 feet long and 23 feet wide. Cloisters are arranged at the front and side of the building. It is proposed at some future date to form niches for urns in the recessed spaces on the walls of the cloisters. There are also provided here mortuaries, waiting-rooms and several other offices.

Hull Crematorium.—This crematorium is built of red brick externally with artificial stone dressings; it is designed in the Early Perpendicular style, freely treated. It comprises a chapel 24 feet square and an incinerating chamber 20 feet wide and 24 feet long. The catafalque here is constructed of stone and draped with velvet.

Sheffield Crematorium.—This building, which was erected in 1904, forms an annexe to the existing chapel of the City Road Cemetery. The crematorium is 36 feet square inside and has accommodation for two furnaces, only one of which is installed at present. The building, which is of fireproof construction, is roofed with an octagonal dome of stone ribs and concrete, covered with roofing slabs of artificial stone. It terminates in a stone lantern, which is designed to provide both light and ventilation, and also serves to enclose the furnace shaft.

City of London Crematorium, Ilford.—This building is planned with a chapel 24 feet wide and 25 feet long; the cremating chamber is 37 feet wide and 30 feet long, with provision for two furnaces, only one of which is at present erected. The original plan has been improved, a waiting-room having been added and access from the chapel to the incinerating chamber being arranged through a small lobby, in place of passing through the tower, at the side of the

Digitized by Google

chimney-shaft. The lower floor of the cremating chamber is reached by means of a stone staircase. In this building a fuel store is provided on the ground-floor level, in addition to the one in the basement. The arrangements for a pilot fire in the chimney are also provided at this floor level. The opening into the incinerating chamber at the head of the catafalque is designed in terra-cotta and fitted with a pair of iron doors, which are covered with curtains.

Geneva Crematorium.—This scheme when completed will comprise one of the finest examples of a crematorium and columbarium. The crematorium, which is designed in the Byzantine style, is the only portion at present completed; it has provided on the ground floor a chapel and under the same the incinerating chamber. The catafalque here is of an unusual design; the coffin is placed under the catafalque, resting upon a lift, which is automatically lowered when the committal sentence in the service is reached. It is proposed at some future date to erect colonnades branching right and left of the crematorium with provision for urns. I might mention the general arrangement of this building is to be found in France and Germany.

Mount Royal Crematorium, Montreal.—This building has provision of a large conservatory or waiting-hall, 82 feet long and 40 feet 6 inches wide; it is constructed principally of glass and iron. The floor is laid with coloured marbles and banked with plants, forming a magnificent entrance-hall. Leading from the conservatory the cremating-hall is reached, which is 56 feet long and 20 feet 6 inches wide; it is constructed with a groined stone roof; the floor like that of the conservatory is laid with marble, and the walls are lined with a marble dado. Four doorways are provided for passing the coffins into the incinerating chamber, each being fitted with an elaborate bronze door. The incinerating chamber, which has provision for two furnaces, is 56 feet long and 20 feet wide. At the rear of the conservatory, with access from the same, three large vaults or columbaria are provided for the reception of urns.

The Earl Crematorium, Troy, New York.—This building, which is designed in the Romanesque style, is 136 feet long and 70 feet wide. The chapel is 40 feet long and 26 feet wide, with a chancel 26 feet by 16 feet; it is a model of architectural skill, and its furnishings are throughout in good taste. The reception-room, which is 24 feet by 20 feet, is most artistically decorated. The walls are of Siena marble blocks, laid in 12-inch courses, surmounted with a carved moulded cornice of the same material, and supported by a wainscotting of pink African marble 42 inches high; all the doors and windows are covered with elliptical arches of pink African marble, and in the angles are figures holding laurel leaves and flowers, executed in marble mosaic. These arches are borne upon seventeen columns, each 5 feet 9 inches high and 11 inches diameter. The tower at the south end is 45 feet from the chapel, with which it is connected by a loggia of three massive granite arches; it is 90 feet high and 18 feet square at the base.

Crematorium and Columbarium, San Francisco.—The crematorium here contains a chapel which occupies one-half of the first floor and has seating accommodation for 140. It is fitted with all the necessaries for conducting a funeral service. Beneath the chapel on the ground floor are four rooms—reception-room, preparation-room, incinerating-room and temporary urn-room. The coffin is received in the reception-room and afterwards placed upon a lift and raised to the chapel above; after the service it is noiselessly lowered to the incinerating chamber. The incinerating chamber is supplied with two furnaces. Around three sides of this chamber is constructed a gallery with seating accommodation for those relatives or friends who wish to witness the introduction of the coffin into the furnace. The columbarium, which is situated about 650 feet from the crematorium, has provision on the ground floor for upwards of 1,700 niches, varying in capacity from two to twenty urns. The first floor is a duplicate of the ground floor, with the exception of the quadrants being lighted at the top instead of the sides, and contains 1,600 niches. The second floor is similar to the ground floor, excepting the quadrants and wings are omitted; provision is made for 700 niches on this floor.

The Planning and General Arrangement.

Having given illustrations of various types of existing crematoria and columbaria, I propose that we now consider some details of the requirements.

The Chapel.—The chapel or hall should be planned with a minimum floor space of 1,200 super feet. When the necessary seating is provided, and the catafalque fixed, there will be found little waste space. I should advise provision be made for urns on the inside walls of every chapel, as it adds to the beauty of the building. In some cases, a columbarium is provided under the chapel, with access from the same or the entrance lobby; an instance of this is to be found at Liverpool. A system of electric inter-communication between the chapel and the incinerating chamber is necessary; a bell-push should be provided either on the clergy's desk or in the floor near the same. By this means the engineer is informed the moment it is necessary for him to cause the coffin to pass from the chapel into the incinerating-room.

The Catafalque.—The catafalque or table upon which the coffin is placed during the service should be planned to stand with its head abutting the wall of the incinerating chamber. When the incinerating chamber is planned under the chapel, then the catafalque should be situated so that when the coffin is lowered it will be deposited near the front of the furnace. The catafalque in general use is about 12 feet long, 3 feet 8 inches wide and 4 feet high; the top is fitted with an apparatus worked by means of an endless chain, which conveys the coffin from the catafalque to the carriage, which is arranged to run upon lines inside the cremating chamber. By this means the coffin may be deposited in the front of one or more furnaces without handling. It is subsequently transported from the carriage into the furnace by the means of a lever. This latter operation has to be quickly performed, for as soon as the coffin enters the furnace it commences to burn.

The opening in the wall of the incinerating chamber should be the full width of the catafalque, and about 2 feet 9 inches high. It is fitted with a pair of iron doors and should be covered with curtains. It is advisable to enclose with a drapery the portion of the incinerating chamber occupied by the carriage when waiting to receive the body.

Incinerating Chamber.—The first important question to be decided in planning this chamber is the number of furnaces to be installed. When planned for a single furnace this room should have a minimum width of 20 feet and 25 feet in length; this will be sufficiently large for either a "Simon" or "Toisoul-Radet" furnace; when two or more furnaces are provided then the superficial area will be increased in proportion. The types of furnace principally in use in this country are those patented by Messrs. Simon, Ltd., of Manchester, which is heated by coal and coke, and that of Messrs. Toisoul, Radet & Co., of Paris, heated by coal gas.

When a "Simon's" furnace is installed a basement about 6 feet 6 inches in height is required to receive the lower portion of the apparatus. It is advisable to form an opening in the floor clear of the same. By this means the expansion and contraction which takes place will not affect the structure. The heating of this furnace is generally commenced in the lower part, and the stoking continued from the feed-hole at the ground-floor level.

When a "Toisoul-Radet's" furnace is installed no basement is required; the only provision necessary is a small pit at the rear in addition to the excavation for the lower part of the furnace, flues, &c.

The furnace should in all cases be planned to stand 10 feet from the wall of the chapel.

Chimney-Shaft.—The chimney-shaft should be planned in as close proximity to the cremating furnace as possible; the internal measurement at the base should be at least 2 feet square, and be carried up to a minimum height of 60 feet. The chimneys at Hull and Ilford are 70 feet, while that at Birmingham is 80 feet, but I have found, when these furnaces are at work, the dampers are rarely withdrawn to their full extent. I have therefore arrived at the conclusion the height is excessive. The provision made for a pilot fire differs with various crematoria; at Ilford a small furnace is arranged in the shaft (at the ground floor level) for the fumes to pass direct into the chimney until the introduction of the coffin, when they then pass over the pilot fire and up the shaft. From inquiries I have made I fail to find evidence that any gases given off from a body escape into the main shaft, therefore any arrangement of an elaborate character is unnecessary. If an opening of about 2 feet wide by 3 feet high, fitted with iron doors, is formed at the base of the shaft it will be found to meet all the requirements for lighting a small fire and causing a draught.

Columbaria.—In planning these buildings the first point to be considered is the number of urns for which accom-

Digitized by Google

modation is necessary. When a building is planned with a large hall having a series of small apartments or halls leading from it, the hall can be fitted with niches to suit the requirements of the poor, while they that are in a position to pay larger fees find accommodation in the various small apartments, where they can obtain greater privacy when visiting the remains of friends.

The niches or receptacles should be arranged to hold from one to five urns in a single compartment. In constructing the niches there are many patent materials on the market which can be brought into use, such as expanded metal, terra-cotta partition blocks and various others. The urns in use are known as the "box" or "vase" shape; the first mentioned measure 16 inches by 8 inches, and are 8 inches high, the latter are about 12 inches diameter and 18 inches high. The urn in general use in this country being of the "box" shape, provision should therefore be made, with few exceptions, for this design. The fronts of the niches should be closed with marble or glass slabs, held in position by detachable copper or iron fittings and frames, thus rendering them dustproof; the interior of the niches can be plastered, distempered, or artistically decorated.

Cost.—The cost of a crematorium will depend upon the number of furnaces installed, the accommodation provided for the reception of urns and the general style and decoration of the building. The Woking crematorium cost 5,022*l.*; the Leicester crematorium, with chapel for inhumation service and the various other buildings, cost 13,830*l.*; the Birmingham crematorium, 5,000*l.*; Liverpool crematorium, 8,000*l.*; Ilford, 7,000*l.*; while the crematorium at Hull I am informed by the city engineer cost only 2,700*l.*

OFFICIALS AND PRIVATE PRACTICE.

THE annual report of the Ulster Society of Architects states that, the attention of the Society having been called to a custom prevailing in some districts of allowing county surveyors, assistant county surveyors and surveyors to urban councils to engage in private practice, it was resolved:—"That the attention of the various county and urban district authorities in Ulster be called to the desirability in every case of terminating the practice on the following grounds:—It is to the advantage of public interest that public officials should be adequately remunerated and give their whole time to the discharge of their public duties without the distraction of other work, obviating the natural temptation to attend to that which increases their income to the neglect of those duties which are discharged under salary. They should also occupy a position of entire independence, so that they may deal with local contractors and others without fear or favour, which can never be the case when depending on private practice, probably obtained from or through the influence of those with whom they have public relations. It is an anomaly that surveyors to urban district councils should have the power to approve of plans prepared by themselves, and to approve or disapprove of plans prepared by architects who are in private competition with them for private practice. As a result public interest must, on the one hand, suffer; and, on the other hand, it is grossly unfair to architects practising in the district. The difficulty of obtaining the services of a competent surveyor and adequately remunerating him for his entire time might be got over by grouping urban districts under one surveyor or other suitable means."

NOTES AND COMMENTS.

A DIFFICULT task awaits the officials of the domains in France, for they will have to prepare an inventory of all the property belonging to the Church in France. At the time of the first Revolution the ecclesiastical estates were seized and devoted to other purposes. But it was agreed under the Concordat that measures should be taken which would enable people who wished to bequeath property to the Church to do so. It is believed that the value of such property at the present time is about 300,000,000 francs. The estimate of the revenue which it can produce varies from 7,000,000 francs to 14,000,000 francs a year. What proportion of the property can be claimed by the State will have to be determined by the surveyors and lawyers engaged for the purpose. A great many cathedrals and churches which are considered as historic monuments are national property. But there are many other buildings which are not comprised in that category. It is calculated that the annual expenses for keeping up buildings which are not conserved by the State amount, at least, to $3\frac{1}{2}$ millions of francs. That amount would be one-half of the revenue which some experts calculate. Property which can be claimed as belonging to the State is to be returned to the State.

IT would be interesting to be able to study the reports which the various conservators of the Louvre have prepared by order of the Minister of Fine Arts. In order that there might be no doubt about the kind of information which was desired, printed questions were sent to those officers. In each case suggestions are to be given about the rearrangement of the collections. It is expected that as a result there will be more concentration of various objects, and that henceforth there will be less necessity to make long journeys through the museum in order to compare objects which should be considered as being of the same class. It is also anticipated that the opportunity will be taken to remove a great number of acquisitions which are of doubtful authenticity. All museums, it is believed, can produce testimonies to the incapacity of their officers; but the Louvre is supposed to surpass all others in Europe in the number of falsifications. Of course it is outdone by the New York Museum.

A DEPUTATION waited on the Maidstone District Council last week in order to appeal for the retention of the old Palace gatehouse. It was not the first attempt which had been made, and money had been already subscribed in order to preserve the remains. One gentleman who had given over 100*l.* said if the building were demolished he would consider himself as unfairly treated. The Kent Archæological Society and several other archæologists and artists had expressed a desire for the preservation of the building. As soon as the deputation had left it was immediately proposed, "That the old gatehouse in the Palace gardens be now removed." One alderman said that, having received the gatehouse as a gift and under the promise that it was not to be removed, he considered it was unfair on the subscribers. Eventually the resolution was defeated. We hope it will be taken for granted by the Council that the old building, which is at least 800 years old, merits their care.

"THE spacious Shenan spreading like a sea," which was the poet SPENSER'S description of the largest of the Irish rivers, has been brought into notice this week by the sale of an ancient weir on it to a London syndicate. The Shannon in parts of its course divides itself, and on one of the branches about a mile north of Limerick is the weir for which a sum of 13,000*l.* has been paid, the lease having only thirty years to run. It is said that the first grant of the fishery was by King JOHN about A.D. 1210. Limerick, from its position, was in those days an important city. Foreigners as well as native tribes strove to possess it. In the twelfth century the king of it sought the assistance of the early Norman invaders against a neighbouring king. Afterwards the strangers held it. A grant of Limerick to HERBERT FITZHERBERT was made in 1179, who resigned it to PHILIP DE BRAOSA, or BRUCE. A provost was appointed in 1195. King JOHN arrived in the city in 1210, and ordered a bridge and castle to be erected, and a mint was established. Many Englishmen then settled in Limerick, and the wall surrounding their part of the city was fortified with twenty-four towers. The fishing was granted to WILLIAM DE BRAOSA. Afterwards the bishops of the district were tenants, and it then passed to the Corporation, whose representatives sold the property about twenty years ago.

THE retention in London of Mr. PIERPONT MORGAN'S valuable collections has had the effect of inciting the Americans to organise against the imposition of high duties on works of art which are not commercial speculations. One result is the establishment of an American Free Art League. It cannot be said that the entry of such works as the FRAGONARD paintings which were lately exhibited in London would deprive any American painter of a commission. A great many Americans who are wealthy have no doubt a preference for old works which almost amounts to a mania, and in consequence the men who furbish up fragments into complete objects are able to reap a fine harvest in the United States. But there are also Americans who believe that a modern house should be adorned with modern works produced by their countrymen, and one class can be set against the other. The best evidence that there is no jealousy among the artists is found in the number of them who form the executive committee of the Free Art League.

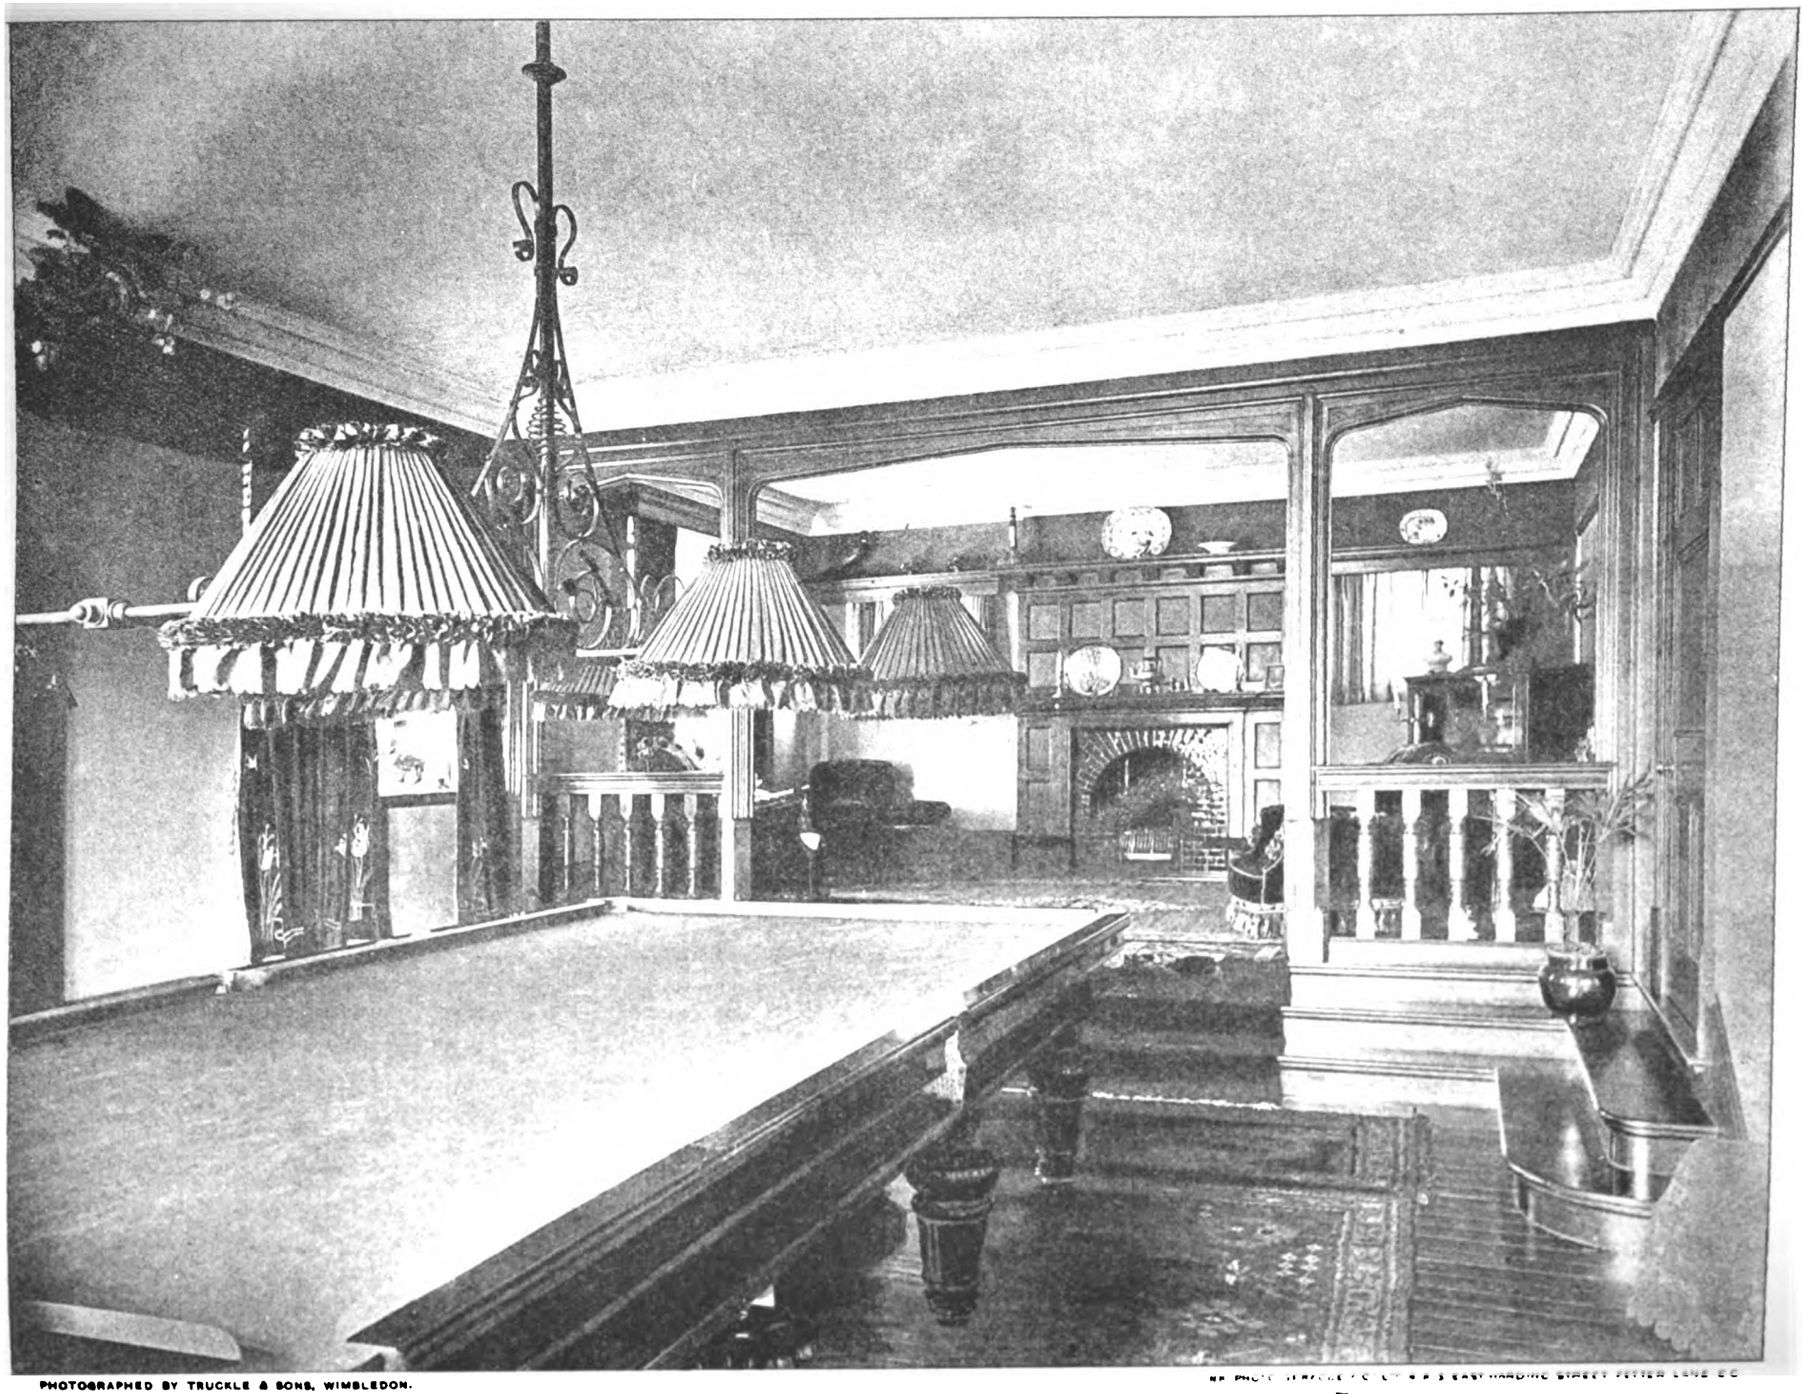
ADDITIONS TO GREENLANDS, CATERHAM. FRONT VIEW.—GARDEN VIEW.—INTERIOR OF NEW BILLIARD-ROOM.



THESE additions were made to the existing house in order to increase the accommodation by a large billiard-room and five new bedrooms. As the building line is rather near the public road and offers insufficient space for carriages to turn in, the main entrance was continued as a corridor porch about 25 feet long right up to the front boundary wall, with a gabled archway and oak gate in same. The external walls of the new portion, which had to be carried out somewhat in character with the existing building, are of 14-inch brickwork with an outer casing of knapped flints $4\frac{1}{2}$ inches thick (making 18 inches in all), having red brick quoins and dressings. The billiard-room, in addition to a recessed fireplace, has a raised dais at one end divided by a screen from which to watch the players, or which can be used as a card-room and for other purposes. The work was carried out by Messrs. J. & J. WARD, builders, of Warlingham, Mr. WALTER E. HEWITT, A.R.I.B.A., of 22 Buckingham Street, Strand, W.C., being the architect.

OFFICES: NO. 47 BALDWIN STREET, BRISTOL.

THE illustration herewith is a perspective view of a new front to the offices of Messrs. W. F. LAVINGTON & SON, wine merchants, 47 Baldwin Street, Bristol. The front was erected in consequence of a street improvement made by the Corporation of the city and county of Bristol. The work was carried out under the supervision of Mr. T. H. YABBICOM, M.I.C.E., city engineer of Bristol, the design being prepared by Mr. G. WRIGHT, architectural assistant on his staff.

THE architect of the Bishop's Throne published last week is Mr. WILFRID RANDOLPH.

THE COLONIES AND COLONIAL ARCHITECTURE.

(Continued from last week.)

SOUTH AFRICA.

WITHIN a few decades a complete revolution has taken place in South African styles of architecture. Less than half a century ago, according to the *British and South African Export Gazette*, the Dutch type of building—spacious, two-storeyed, flat-roofed, quaintly gabled, with whitewashed or stuccoed front, and the inevitable stoep running along its entire length—prevailed in town and country alike, save where the early Victorian barracklike structure of the merchant firm and the primitive tin shanty of the store-keeper or trader had gained a footing. Now, however, the unpretentious structures of earlier days are rapidly disappearing from the larger centres, and in their places stand the palatial public and commercial edifices, the towering steel-frame "sky-scrapers," the inspiring cathedrals and churches and the suburban villas with comfortable interiors and decorative exteriors. There is no doubt that many clever architects from Europe and America have been attracted by the prospects which South Africa offers them, while it is conceded that they have done and are continuing to do yeoman service in the land of their adoption.

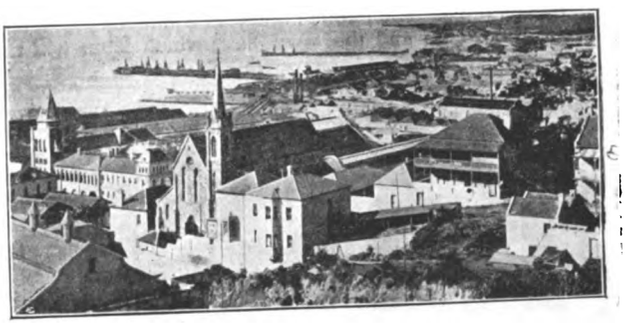
CAPE COLONY.

Capetown, or "the gateway of South Africa" as it is called, is indeed a striking city, and during the last twenty years it has undergone a great change. Old buildings have given place to important structures, of which it is claimed that even London might be proud. Adderley Street is the main thoroughfare, and the finest buildings are in the immediate vicinity. The Cape Parliament-houses, in the centre of the city, form an architectural pile that cost nearly a quarter of a million sterling. The public library is another fine building. Beyond the municipal gardens is the museum containing a valuable collection of specimens illustrative of the natural history of the country, and attached thereto is the South African art gallery, containing a collection of paintings. One of the best known buildings in the city is the General Post Office, a gigantic

POST OFFICE, CAPETOWN.

corner block five or six storeys in height. The new city hall and municipal buildings form, however, the most notable example of official enterprise. The edifice is described as being in the style of the Italian Renaissance, and has three storeys, with a clock-tower and belfry 200 feet in height. Messrs. H. A. Reid & F. G. Green were the architects. St. Mary's Roman Catholic Cathedral is an imposing edifice, whilst St. George's Cathedral, the Royal Observatory and the South African College are, as well as other public buildings, worthy of attention. The most interesting of the old buildings is the Castle, a quaint specimen of a citadel, which was erected in 1666.

Near Rondesbosch, one of the principal suburbs, is "Groote Schuur," one of the residences of the late Mr. Cecil J. Rhodes, which is a specimen of the best period of Dutch Colonial architecture.



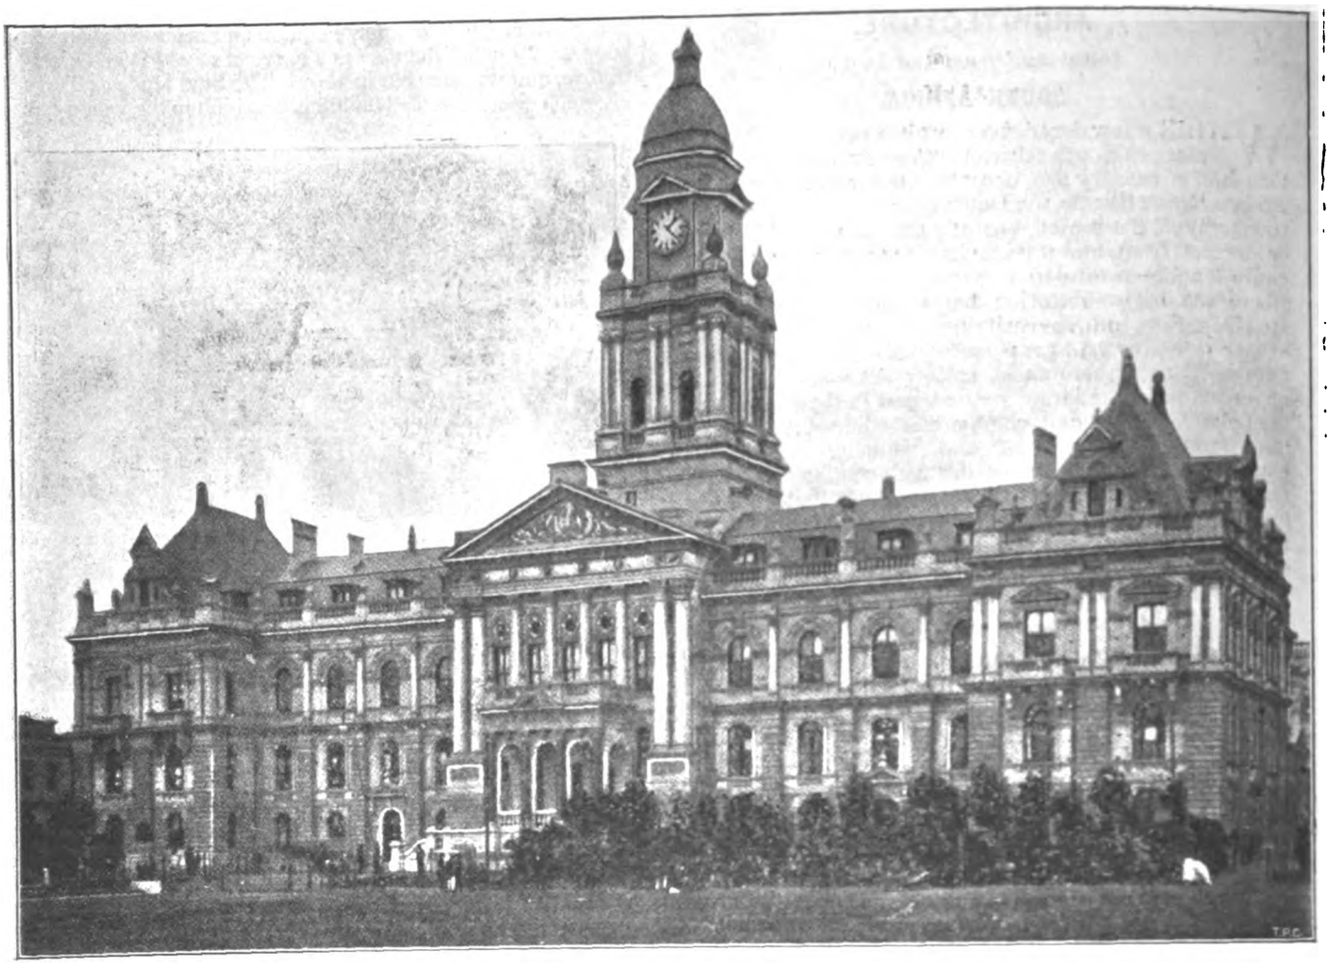
Stellenbosch, thirty-one miles from Cape Town, is Dutch in appearance, having a large square and some old thatched houses. "Oude Libertas" is a survival of old Dutch architecture, and was erected in 1699. The Stad Huis, or Town House, a circular-roofed building, was built in the year 1770.

GROOTE SCHUUR. RESIDENCE OF THE LATE MR. CECIL RHODES.

At Kimberley much has been done, we gather, to beautify the place, and although the old iron houses enter greatly into its construction, particularly in the older business parts, the advance of architecture in the residences and public buildings has been marked, and the suburb of Belgravia, with its substantial residences, is sought after by well-to-do colonists. The chief buildings are the High Court on the Market Square, the town hall, the public library and the theatre.

Port Elizabeth, the "Liverpool of South Africa," derives its name from Lady Elizabeth, wife of Sir R. Donkin, acting Governor in those days. Its position as the chief port of

PORT ELIZABETH, "THE LIVERPOOL OF SOUTH AFRICA."



entry on the south-east coast, its commercial rank, its standing as the second city of the colony in point of population, and its excellent public buildings, commend it to the stranger whom good fortune or otherwise leads within its gates. The Museum, located in the Market Buildings, has a large collection of South African curios. The Feather Market is one of the largest halls in South Africa, and can accommodate over 5,000 people. The public library, built in the style of the Elizabethan period, has 38,000 volumes. Many handsome places of worship adorn the town.

At Grahamstown there is a public library, a museum, a town hall, law courts, hospital and lunatic asylum. There are also two cathedrals, and churches of various denominations.

East London is beautifully situated at the mouth of the Buffalo river, and stands to-day as one of the principal ports of Cape Colony. The town hall is a substantial building with a clock tower, whilst, in addition to the post office, there are several churches, high schools and a Masonic temple.

King William's Town has also the advantage of an attractive site, and contains much of interest. The Government offices were built about thirty years ago. The

Victoria drill-hall and gymnasium is a handsome and useful public building. The public library is commodious, as also are the museum and the town hall, which latter was not long since enlarged and renovated.

TOWN HALL, EAST LONDON.

Queenstown was built as a place of defence, and for this reason the market square in the centre of the town was formed in the shape of a hexagon. The town hall, rebuilt in 1882, is an imposing stone structure.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

AT the rooms of the above Society on Thursday, the 11th inst., a paper was read on "The Better Housing of the Artisan Population" by Mr. W. P. Rylatt, who won the prize for essay on the subject. The question of the housing of our artisan population is one of the greatest problems of the present day. Ever since 1851, when the attention of Parliament was first drawn to the disgraceful state of the houses of the artisan classes in London and in other large cities, Acts have been passed and measures taken to improve the condition of these dwellings. A very great fact in the health of the people, physical and mental, is a cheeriness of surroundings and a pleasant outlook obtained by providing plenty of open spaces, laid out as gardens, such as is carried out on the Millbank estate in London. Many difficulties are met with in carrying out schemes of workmen's dwellings in large cities, one of which is the high price of land, and another is the increase in recent years of the cost of materials and labour. Every advantage should be taken of cheaper methods of building, and perhaps a more reasonable application of the by-laws by the local authorities would allow more latitude in this respect. In a workmen's dwelling scheme everything should be cheap and simple, consistent with good workmanship. The most economical plan of tenement buildings is a parallelogram two rooms deep and with a common staircase, everything as far as possible fire resisting. All staircases, landings and passages should be reduced to a minimum. To bring a little brightness into the lives of the tenants the buildings might be planned round a paved court or quadrangle, opening into a street by one or more archways and laid out with flower beds. This court might be overlooked from balconies on each floor. Much might be done by providing cheaper and quicker means of transit by electric car and railway to enable the better class of artisan to live in the suburbs, and so leave more dwellings in the congested parts of the city for the lower class of workman. In providing dwellings for the artisan class private enterprise has signally failed, and we have acres and acres of jerry-built property in the suburbs, which probably in a few years will fall into a condition almost as bad as that of the wretched dwellings now being cleared away in our slums. The problem of the housing of the agricultural labourer in the country naturally does not attain the vast proportions of the same problem in the city. In this case a cottage costing from 100*l.* to 130*l.*, everything included, is needed. To effect this purely local materials and labour should be utilised as far as possible.

SHEFFIELD SOCIETY OF ARCHITECTS.

AT the monthly meeting of the Sheffield Society of Architects and Surveyors, Dr. H. Scurfield, medical officer of health, read a paper on "The Advantages and Disadvantages of Mechanical Ventilation." The mechanical system he advocated is that by which the fresh air is propelled into the room from a selected pure source, not the "extraction" method by which the foul air is drawn out and the fresh air left to find its own way in. At the same time, he thought churches and public halls might readily be ventilated by extraction fans and plenty of inlets equipped with radiators. For most buildings, however, ventilation by propulsion was the most convenient, because the source of the air could be chosen, the amount of air delivered and the rate of movement could be regulated, and the entering air could be warmed as desired. After giving his experiences of the use of the propulsion method in schools and other buildings, Dr. Scurfield summarised his opinions in the following statement:—Where the cubic space allowance is small, as in elementary schools with 120 to 150 cubic feet, mechanical ventilation is the only system which is capable of giving really good results as regards the purity of the air, but where the cubic space allowance is large, as in hospitals with 2,000 cubic feet, its introduction is probably undesirable. Secondly, if mechanical ventilation is decided upon for a building the fact ought to be realised that by its means the air of the building can be changed at least twice as frequently as by other methods, and that its introduction is equivalent to doubling the cubic space of the building, and that it is therefore well worth while to pay for as perfect an installation as can be obtained. Thirdly, the contract as to what air changes are to be accomplished by the method should be carefully drawn, and after the work is completed careful tests by chemical analyses of the air and the anemometer should be made in order to ascertain that the terms of the contract have been fulfilled. Lastly, the person responsible for the management of the building should thoroughly understand what are the capabilities of the system, so that it may not be expected to perform impossibilities. Mechanical ventilation will keep the air in the classrooms of an elementary school good for a matter of eighty minutes, but if the classrooms are not emptied and filled with fresh air at the breaks, the air in them will be just as bad at the end of the morning or afternoon school as the air in the classrooms of a naturally ventilated school just before the break.

DRAWING AND COLOUR.

ON the 8th inst. Mr. Clausen, A.R.A., the Professor of Painting, began his course at the Royal Academy. He said, according to the *Morning Post*, that drawing was, of course, frankly a convention, for we never see lines round objects. Yet a reference to the drawings of primitive people showed that it had always been natural to represent things by lines. It was a form of expression from the earliest days, a form that gradually became more precise and then acquired suggestion of movement and modelling of surface by gradation. Finally it developed into expression of form by light and shade. He proposed to speak of the drawings of the earlier masters down to the time of Michel Angelo and of those of our time who had been influenced by those masters. There was one great difference between the drawings of the old painters and those that students make in the schools to-day. The old men made theirs with some definite intention, not merely as studies as our students do, and in connection with this point the lecturer compared the ancient and modern methods of art training. He questioned whether with all our advantages our school system was as good in its results as the older plan of working as a pupil in an artist's studio. The work of the old masters, even when they were not of the best, was so satisfactory in its accomplishment that ours seemed tentative beside it. It was, perhaps, because we relied too much on the posed model, rather than the intelligent study of form and movement. There was too much tendency to-day to regard school work as an end rather than a means. The drawings of the earliest painters were unfortunately rare, but the students might see good examples of them at the British Museum by Pisanello and by the elder Bellini—drawings delicate, slight and of a certain angularity. They could see this early drawing, too, in unfinished paintings, such as the "Nativity of our Lord," by Piero della Francesca, which is in the National Gallery. The older Italian drawing resembled the Flemish in its angularity, but was finer in its types and in its proportion of figures. This was partly a question of race and partly because the Italians had never quite lost the traditions of antique art. The Flemings had no traditions, so they tried to follow nature with absolute fidelity; but they had not the Italians' sense of beauty. In the Flemish drawings, even in that of Dürer, the greatest of the primitive draughtsmen, there was a distinct mannerism, coupled with an insufficient attempt to restrain the line or keep it severe—a tendency rather to make it "curly." This tendency was present to some extent in the drawings of Holbein, but not in his best work, such as the famous Windsor drawings, which were above mannerism. It was mainly from the Flemings that the pre-Raphaelites took their inspiration, and the early pre-Raphaelite drawings, especially those of Millais, were well worthy of study. A fine style of drawing was practised then, and it had a great influence on the illustration of the period. Walker, Houghton and Pinwell all owed their inspiration to Millais, whose drawings were sometimes as fine as those of Holbein or Leonardo. Mr. Clausen urged the students to study above all the finest of drawings, those of Raphael. In them they would find that all was given with the utmost economy of means and with everything put exactly where it should be. The only modern who could compare with him was Ingres, one of the greatest spirits of the last century and one of the finest draughtsmen that ever lived. Looking at the drawings of Ingres you could not imagine that the line could be placed in any different position from that chosen by him. Leighton, too, was sometimes as wonderful in the research of his line as Ingres. There were no better examples than these men, and no greater truth to nature than the drawing of Ingres. As models of style in drawing Mr. Clausen cited Alfred Stevens and Watts, and then referred to the work of J. F. Millet. All three, he said, had this in common—expression through the definition of the form. That was the firm basis of an artist's work. Finally Mr. Clausen read portions of the letter written by Whistler to Fantin Latour, which appeared recently in the *Gazette des Beaux-Arts*. A great colourist, Whistler expresses his regret in the letter that he had ever been influenced by Courbet, and puts the case for drawing in the strongest possible way. Whistler criticises his own work perhaps too severely, and tells Fantin that he knows well that the discipline of the drawing of Ingres would have been the healthiest thing for him. "Guided by drawing," he wrote, "colour is a splendid woman with a husband worthy of her." So, said Mr. Clausen, we may take it from Whistler that the serious study of form is the best thing to which an artist can devote himself. It is worth noting that the mention of Whistler's name was greeted with cheers by the Academy students.

Mr. Clausen's second address was devoted to the consideration of the works of artists whose point of view, he said, was not so much the recording of the actual forms as the appearance of those forms under certain aspects of light. This development of drawing corresponded with that of painting from the time of the primitive artists, when every figure was studied by itself, to the latter period in which painters tried to make everything take its place in the scheme of light and shade and colour in which the picture was arranged. The modern point of view showed a wider sympathy rather than deeper insight, for it was impossible to go beyond the depth of expression of the earlier work. Most of the drawings he proposed to show them on the screen as illustrations of the work of artists who drew for effect rather than for form were by Watteau, Claude and Rembrandt. Watteau, however, was not so good an example as the others, as his drawing indicated both tendencies. Mr. Clausen then showed on the screen a nude study and the drawing of a negro by Watteau, both of which he said suggested the influence of Rubens and were like him in manner of drawing. Both, too, were midway between drawing for form and drawing for light and shade. Some other drawings by Watteau were then shown. The little studied graces of his figures were, said the lecturer, as beautiful as they could be, and the spontaneity of his drawing was one of its rarest qualities. After a passing reference to Gainsborough, whose resemblance in some respects to Rubens was commented upon, Mr. Clausen turned to the drawings of Claude. In these Claude showed himself greater even than in his paintings. He gave us in his pictures the sun shining in

Digitized by Google

the sky with every appearance of truth, and in this and in some other respects his work had never been surpassed. Nevertheless, the pictures had a composed and conventional look, and if it were not that this effect had been overpowered by the greatness of the painter's artistic vision his canvases would become tiresome. But Claude's drawings included many of the most fresh and delightful studies from nature, studies of effect made for simple enjoyment, and these were far more attractive than the larger works which were possibly painted because of the taste of the time, when pure landscape was hardly accepted. People often said when discussing Claude's pictures:—"Oh, yes; he is all right for atmosphere, but he could not draw. Look at his trees; they are all alike." There was some truth in this; but if those critics would look at his sketches they would find that the trees there were individualised and natural. Mr. Clausen showed some beautiful sketches of trees and landscape by Claude, and in commenting upon them remarked how few of the landscape sketches by old masters were in colour. They did not approach colour in our way, and it was with them largely a matter of memory. They aimed less at getting the actual colour of nature than its gradations, and the modern men, if they had lost the big grasp of landscape, had arrived nearer to the true hues of nature. According to Sandrart, Claude did paint sometimes in colour directly from nature, and it was said he valued those studies so highly that he would not sell them. The lecturer advised the students sometimes to sketch from the point of view of the Claude drawings and to make their picture rather by gradation than by colour. Mr. Clausen contrasted the work of Ingres with that of Rembrandt. In Ingres we saw science, measurement, analysis and the most beautiful and exact drawing. But his work was almost wanting in human interest, and showed little preoccupation with anything but the posed model, whereas Rembrandt was full of deep emotion and sympathy, and as an artistic inspirer immeasurably the superior. These artists illustrated the two opposite tendencies of drawing for form and for effect. Charles Keene, the modern draughtsman who came nearest to Rembrandt, determined as he did the accents of his drawing by the shape of the shadow, while Phil May's accents were determined by form, much as those of Dürer were.

Mr. Clausen, in his third lecture, treated of "Quality in Colour." Although, he said, there were no mysteries in drawing colour was full of them. Colour itself was hardly definable, for a colour in a picture was not always what its name represented—as white, for example, might be yellow or brown or blue, according to its relations. The quality of colour depended on the way that the paint was put on rather than upon the colour itself—the clearness of the paint put down easily and untroubled. We found quality of colour in most fine work, but much more important than the quality was the harmony of colour—the essential thing was to establish the proper relations. In this connection Mr. Clausen compared Bronzino's "Cupid, Folly and Time" with Tintoretto's "Origin of the Milky Way." In each the quality was good, but in comparison with Tintoretto Bronzino was discordant. The pictures that had been honoured throughout the ages had maintained their places through colour rather than anything else, and the work of Ingres, Scheffer and Gérome does not stand when compared with that of Delacroix and Bonington. Much of Manet's work was ill drawn and in some respects repellent, but the freshness and quality of the paint was nearly always fine, and he seemed to mind little else. In Velasquez alone did we get fine freshness of painting combined with perfect craftsmanship. Mr. Clausen told the students not to accept the dictum that "time and varnish are the best old masters," although both time and varnish might and often did improve pictures. It was safe to conclude that good pictures had always been good and bad ones always bad. The lecturer then touched upon the differences in quality of oil and tempera, and showed that to the flexibility of the first medium was due the wide difference in the aspect of oil-paintings by different masters, and that the more general similarity of works in tempera was due partly to the medium itself and partly to the small number of colours that it was customary to employ. In fresco it was impossible to make alterations, and those made in tempera are likely to show in course of time. In Piero di Cosimo's "Death of Procris," one of the most beautiful pictures in the National Gallery for the quality of its paint, a correction that had been made in the drawing of the hand of Procris had since shown itself.

We could see from unfinished early pictures how carefully the artists planned out everything and drew and painted it piece by piece with exact knowledge of how it would all come together. But the methods of those early artists were altogether opposed to ours—their lights were transparent, their shadows loaded, as in Bellini's "Doge Loredano" and Holbein's "Duchess of Milan." Mr. Clausen urged his hearers to look at the large picture in the National Gallery by Catena—the "Warrior Adoring the Infant Christ"—as an example of the earlier work. It was a picture wonderful in colour, and he believed that it was painted directly in one painting and in full strength of colour. This indicated absolute command of means, and it was safe to say that no one could do it to-day. All our artists arrive gradually at their end, but in the Catena everything was settled before the colour was put on the canvas. The lecturer said that he had dwelt on this because it showed what underlay all good work, that the artist should know exactly what he wanted to do, and that he should know his trade. As a piece of splendid painting the sleeve in the so-called "Ariosto" of Titian was cited—a piece of beautiful quality, dark and grey and yet full of light, and probably painted thinly over a white ground. After touching on the various methods of painting employed by Rembrandt, sometimes complex, sometimes direct as in the case of the head of the old lady in the National Gallery, Mr. Clausen said that direct painting was well enough for some things, but that if an artist had a subject that demanded a wide range of colour the range of painting had also to be extended. Most of the great painters seem to have felt that paint in the shadows must be more subtle than in the lights, and where this has not been suggested a certain monotony seems to be inevitable, as in the paintings by Frank Hals at Haarlem, which were wonderful, but a little dull and flat. For sheer beautiful quality of paint Watteau and Gainsborough were the most remarkable. Watteau's jewel-like colours looked as if they must have been mixed with some rich varnish that gave them almost the quality of enamel. But for the charm of freshness and lightness of hand no painter ever beat Gainsborough when at his best. It seemed a dreadful thing to say, but even Velasquez looked a little heavy beside Gainsborough. Mr. Clausen said that he had felt this when looking at the "Venus and Cupid"—a fine picture that he hoped even yet would become the property of the nation—beside which was hung a portrait of a man by Gainsborough. The work of Gainsborough had more of the charm that comes from the sense of ease in painting than that of any other artist. And after all, this freshness of touch seemed to be one of the great secrets of quality. The less we did to the paint the better, and to do that rightly we must know exactly what we wanted to do. It all came back to that.

HOUSES IN HERALDRY.

ALTHOUGH animals are largely used in blazoning, various objects which are the work of men's hands are sometimes introduced. It would therefore be strange if towers and other fortifications were omitted. In order to give more precision to a conventional sign, some arms bore reference to the situation of the family mansion. Thus Wallop, Earl of Portsmouth, has "Argent, a bend wavy sable," alluding to a well springing from a hillside or hope near the family house in Hampshire; the name being derived from this local circumstance. Hume of Nine Wells, the family of the great historian, bore "Vert, a lion rampant argent within a bordure, or charged with nine wells or springs barry-wavy azure and argent." The estate of Nine Wells is so named from a cluster of springs of that number. Their situation is picturesque; they burst forth from a gentle declivity in front of the mansion, which has on each side a semicircular rising bank, covered with fine timber, and fall, after a short course, into the bed of the river Whitewater, which forms a boundary in the front. These springs, as descriptive of their property, were assigned to the Humes of this place as a difference in arms from the chief of their house.

Mr. B. J. Tench, of Norwich, has been awarded the first prize of 100*l.* in the competition for the extension of the Norwich Shirehall; Mr. W. W. Addington, of London, obtained the prize of 50*l.*; and Mr. W. J. Dunham, of Norwich, the prize of 25*l.* Mr. A. J. Wood was the assessor.

THE QUANTITY SURVEYOR'S RELATION TO ARCHITECT AND BUILDER.

ON Wednesday evening last the members of the Quantity Surveyors' Association resumed the discussion, adjourned at the meeting on December 6, of the paper on this subject contributed by Mr. F. B. Hollis, and published in *The Architect* of December 8. Mr. A. J. Gate, F.S.I., vice-president, occupied the chair.

The hon. secretary read three communications from members who were unable to be present at the adjourned meeting.

Mr. HENRY SMITH, in a letter to the author of the paper, made the following remarks :—

. . . In your definitions of quantity surveyor you mention that he should have intimate acquaintance with the law of dilapidations, &c., light and air cases, and value of property for mortgage and other purposes. Now, I agree that he should have intimate and full acquaintance of such, but from personal experience I find that a quantity surveyor has but very little standing in the eyes of the law on these matters. I have been engaged upon very many cases of such description to give expert evidence, and I have found that nothing but the term "building surveyor" will satisfy the law that one knows what he is talking about and is capable of giving expert evidence, and although a quantity surveyor may be fully capable and able to give first-class evidence, he is discredited because he is a quantity surveyor and not a building surveyor, and in many instances of important cases I have been engaged upon I have been compelled to use the term "building surveyor" to get any importance attached to my evidence. In the question as to whether quantities should form part of the contract, I say Yes, providing that the quantities being a part of the contract does not invalidate the responsibility of the quantity surveyor for errors. I do considerable work in both private and public buildings, and I can say that in not one solitary case has the quantity surveyor's work been allowed to form part of the contract, and why? Simply because it is thought—and somewhat truly considered under the present conditions—that if the quantities formed part of the contract it invalidates the question of responsibility as to accuracy. One of the many reasons I have had given is that if the quantity surveyor's work be accepted as part of the contract, then the provisions usually included by the architects for "contingencies and extra work" cover also any omissions (if any) on the part of the quantity surveyor. How many architects carry out a job of any sort without the "contingency provision"? Not many I fear; and if not put into actual lump-sum amount they insist on having an item measured for provision of brickwork or digging and concrete, &c., and why? Simply as a cover to allow for any matter which, according to the plans and specification, may require altering or adjusting as the work proceeds, and they like those provisions entirely for their own use. I admit that it is desirable in the practice of an architect, where alteration works or uncertain party-wall works, &c., occur, to include something to deal with to cover matters that arise when old work is exposed, as that usually happens where one has so many to satisfy where more than one person is interested. I know that this question on the point of provisions is a very delicate one, and until that point can be dealt with to the architect's satisfaction, they will not, I fear, give the quantity surveyor any recognised position in the contract. I use the architect's name in this matter because he is the man that prepares the contract on behalf of the employer. I point this one question out now because I have had it so often discussed. Another serious clause in quantities and which does not tend to improve matters, and which is often used by supposed qualified men, is "that the quantities have been prepared with care and accuracy as far as possible to obtain same, but the contractor must satisfy himself as to whether they are accurate or not before he signs the contract, as no claim will afterwards be considered if any error or omission be found." It is these clauses that make the contractor dissatisfied and the employer suspicious, and especially when they have to pay full price to a man who is uncertain whether he is competent or not. That sort of quantity surveyor is not the man to head his bills of quantities thus, "that these bills have been carefully prepared, and are guaranteed correct by the quantity surveyor." I have spoken to many architects on the matter as to why they object to quantities forming part of the contract, and the answer invariably I get is, "No, thank you; we get quite enough trouble without giving ourselves more." And one more point. I am of the opinion that the employment direct would be a great mistake both as to the surveyors' side of the question and to the architects' side. It certainly means chiselling down prices, and allows of incompetent men being pushed on to the architect, and I need not discourse on the many drawbacks that would arise to those who are experienced in the matter of the present competitive rules and ways of getting work; certainly one question the employers would be sure to insist on, "that no fees ought to be paid to the surveyor till the job is complete and accounts settled to the building owner's satisfaction."

Mr. A. FERGUSON, of Belfast, in a letter, said:—I quite agree with your definition of the relations of the quantity surveyor to the architect and the building owner, which must in reality mean that the latter is the principal and the former his agent. Therefore it follows, as a matter of course, that if the principal, or building owner, allows the bill of quantities to form part of the contract he fully admits his responsibility, and clause 13 does no harm. This reasonable course, however, is not adopted in a great many cases owing to the principal, or building owner, refusing to allow the quantities "to form part of the contract," thereby shifting his responsibility to the shoulders of the building contractor, who in turn rolls it over to the quantity surveyor. At this stage clause 13 becomes operative, and if acted on would not only compel the quantity surveyor to take a risk other than that laid down by law, but also to pay the debt of his principal for a shortage in quantities which he, the principal, alone should pay for, as he alone derives the benefit of same, surely there is something wrong in a clause that would operate so unjustly. Now the remedy I suggest is to amend clause 13 to read as follows:—"Any member of the Association who shall supply bills of quantities may hold himself responsible for their accuracy as a whole, or in cases where the quantities are not intended to form part of the contract he may insert an item in same to cover any risk the building contractor is obliged to take by having to accept the bill of quantities to be correct as a whole." If this were adopted the building contractor could protect himself by an insurance policy, and the insurance company could protect themselves by stipulating that the bill of quantities should be prepared by a member of our Association.

Mr. H. LAWRENCE COX, of Manchester, in a letter bearing upon the paper, said:—I am decidedly of opinion that a quantity surveyor should be designated by his true title, and not merely as a "surveyor." The house agent, amongst others, is much too fond of annexing the latter title, and I deem it desirable, both in the interests of the public and the profession, that a definite title should in all possible cases be adopted. The crying abuse of the use of the title "quantity surveyor" by men who issue quantities containing such choice items as those quoted in the paper calls for serious and immediate consideration. I think it very desirable that our Association should continue in the good work of educating the public by the publication and discussion of papers bearing upon the peculiar intricacies and arduous nature of our work, and the necessity, as a matter of justice between owner and contractor, for the work to be solely in the hands of skilled and qualified practitioners, to which section all members of our Association may be safely said to belong.

The CHAIRMAN: In the absence of any motion to adjourn this meeting the discussion now becomes open.

Mr. B. LAINE PEARSON: I would like to offer my opinion on a few points raised by Mr. Hollis's admirable paper. First, as regards the latter part of the fifth section of the definition of a quantity surveyor, which states that he should be a man having an acquaintance with the value of property for mortgage or other purposes. This appears to me to be more the business of a valuation surveyor or house agent, as, although there are many quantity surveyors in London who occasionally do this kind of work, I believe by far the greater number do not engage in it, and to my thinking rightly so, as a quantity surveyor proper is a man of detail rather than that of piecemeal valuation. Secondly, in reference to the difference in modes of measurement in London, the Midlands and the North. As a man who has had considerable experience in measuring up works, and also estimating and bills of quantities in a great many different towns in the North and Midlands, I have found that, with a few exceptions, their chief systems are a want of system, practically no two men following the same procedure, and

Digitized by Google

all having one system, viz. that of shortening detail, even in cities like Manchester and Leeds, where there are printed modes of measurement agreed on between the architect and the builder. Each man follows his own method, and although there has recently been a lot said about standardising modes of measurement, I am afraid it would have to take the form of perfecting the London system only, as, on the one hand, the men who prepare quantities in the North and Midlands would mostly be unwilling to change, and, on the other hand, there are only a few improvements that could be culled from their practice, the chief of them being the running of extra double course at eaves, and cutting and waste in slating and tiling, and the number of tees in iron and copper pipes.

Mr. H. J. West: I should like to ask what is the definition of a quantity surveyor, though it does not make much difference what becomes of the actual word used. Once he is a measurer he must be a quantity surveyor, and when we stipulate a list of what he knows and what he does not, this is a definition. The various items of difference cropping up occur mostly in description. I am quite sure, he continued, that all our errors are not made by qualified men. Slight clerical errors there may be for which I think it would be most unjust to hold a surveyor responsible, and although this clashes with clause 13 of your Articles of Association, still I cannot help thinking that on the whole it would be beneficial to the profession if quantities were always made part of the contract. I know of one public body who made quantities part of the contract, and they stipulated that any errors made by the surveyor should be paid for by him, and *vice versa*. Such an arrangement gets over the difficulty of, at all events, the possible charge that a surveyor will take the quantities out more fully in order to increase his fees. That arrangement I know is in vogue with one of the large public bodies here in London, and, so far as I believe, it works very well, and in the many jobs I have been engaged in it has certainly not been found that the cost of the work comes out very different from what they were originally estimated at—in other words, the inaccuracies have been practically nil.

Mr. E. A. Wylie: I should like to say that I believe that bills of quantities should form part of a contract. I also agree with clause 13 that the quantity surveyor should guarantee his quantities.

Mr. T. W. Biggs: With your permission I wish to say a few words. I would commence with trying to deal with the heading of this paper, because there appears to me to be a very vague idea going about as to the relation of the quantity surveyor with the building owner and the builder. This paper sets forth very clearly some value of the quantity surveyor and his relation with the building owner, the architect and the builder. Now in the present state there can be no difference of opinion as to that. I have heard it said to-night, and many times, that the quantities should form part of the contract. A municipal authority or corporation appoints a quantity surveyor, and at the end of the bill he adds his fee as agreed upon with his client. If that job does not go through the client is responsible to the quantity surveyor—that is the relation he bears. The contract is signed this afternoon at four o'clock, and at the moment the contract is signed the liability passes from the building owner to the quantity surveyor. The builder takes up the responsibility of paying quantity surveyors' fees, and if his advances are 1,000*l.* at a time and he does 1,400*l.* worth of work, and he receives a certificate for 1,000*l.*, it pays the quantity surveyor to go into liquidation. Now I think that clearly sets forth the relation of the building owner, the quantity surveyor and the builder. Well, now, what relation has the quantity surveyor to the architect? This is a very vital matter. There are architects and architects. There are scrupulous architects and there are some that possess very little of that commodity, but I think it is better for me to say as little as possible, excepting that some architects give you drawings that you can measure from, and some give you something which you cannot measure from. So far as I am concerned, there is no relation whatever where there is no business. The architect gives the surveyor a job, but, so far as any contract between the two, there is none.

The Chairman put the vote of thanks to the meeting, which was carried unanimously.

Mr. Hollis, in his reply, said:—The principal points touched upon by the gentlemen who have spoken during the discussion are, briefly, whether or not the bills of quantities should form part of the contract, clause 13 of our Association, and uniformity of fees. As to the first point, should bills of quantities form part of the contract? Mr. Cross, who opened the discussion, contended that such a course was an evil one, inasmuch as it tended to lower the status of the quantity surveyor, and to make him careless as to whether his bill was a good one or otherwise. I cannot go so far as my friend has gone in his assertion, as I think that the production of one bad or even indifferent bill would do a quantity surveyor more harm that twenty good ones could neutralise in the opinion of the employer or the architect for whom he was working. I am still of the opinion expressed in my paper, that making the bills part of the contract would tend to a more thorough consideration of doubtful points in the specification and plans, as, with the bills part of the contract, they would be even more carefully prepared than at present, seeing that so much depended upon their accuracy. Mr. C. John Mann—whom, I am sure, we were all glad to see present—demurred very much to going beyond the law of the land in the matter of a quantity surveyor being made liable, or rather making himself liable, for the inaccuracies in his bill of quantities. But I think with Mr. Cross that this idea is of the "bogey" description, and must in a great measure be due to a mistaken conception of the law as it at present stands in its relation to a quantity surveyor's liability. Does not our clause merely emphasise the law? As I understand the law in its relation to this, it is that the party who pays for the bill of quantities has a claim in common law against the surveyor who prepares it. If it contain inaccuracies directly due to negligence, all that we as an Association insist upon the offender doing (if the case is brought before the Association officially, and it is, of course, the only authority we possess), is to compel the person complained of making the necessary restitution by the threat of expulsion in the event of his non-compliance with such a rule after it has been duly gone into by the Association, which, as Mr. Gate observed, "would be a life-long disgrace." Mr. Sanders thought that the quantity surveyor's liability should be limited to the amount of his fees in the matter in dispute. This, of course is opening up the whole question of a surveyor's liability, and I can only say that if such an amendment to our articles of association was duly proposed by a member, that the machinery existed for ascertaining the wishes of the majority of the members upon the question. At present I know of no such general feeling amongst our Association. As to a schedule of fees for any particular class of work, public or private, from a humble cottage to a lordly mansion, from a small public-house to a palatial hotel, or from a small village hall to the municipal buildings of a great city, it is, as we all know, a most delicate and difficult subject to deal with. And perhaps I may say here that a "fees" sub-committee has been appointed by the Council of this Association, and I am sure that if they can formulate any scale of fees or assist in any way the object we all have in view as regards this they will do so.

We are all aware that some men will take work at a fee which makes it impossible that good work can result, but how to stop such practices is a very difficult matter even to suggest, not to say undertake. As some at least of you remember, I mentioned at our dinner that a district council in advertising for tenders for preparing bills of quantities for a proposed building stipulated that the surveyor should be a member of our Association. When more public bodies are like this one in that respect, then uniformity of fees becomes within a measurable distance of becoming practicable.

Now, as to writing the specification, I consider the architect, as I mentioned in my paper, the best person to do this, but I also agree with Mr. Mann that a quantity surveyor can do so perhaps in greater detail from his dimensions, and I am sure that every member of this Association will be glad to give his architect all the assistance in his power in this respect.

The question of supplying a copy of the dimensions to the successful firm in tendering for the work has been touched upon by the several gentlemen taking part in the discussion. It is one thing to answer the request of a builder for information upon any one particular point and to supply him with a copy of the dimensions bearing upon that individual item, and quite another matter to permit him to have a copy of the whole of the dimensions; and I agree with Mr. Mann that such a course places a weapon in the hands of a person with which the architect might be unduly harassed. With regard to the question of quantities being

Digitized by Google

ordered and paid for direct by the employer, I cannot quite agree with the gentleman that the quantity surveyor should be paid direct for them. This course might possibly result in the work being more evenly distributed amongst the members of our profession than is at present the case, and would doubtless prevent some architects from placing all their work in the hands of one quantity surveyor; but from my experience of architects the majority prefer to have a quantity surveyor who is cognisant of their methods and style, and the course suggested by my friend might lead to incompetent men being employed. Mr. Laine Pearson I know to be an expert on method and materials. I do not think that I wish to differ with him on any point. I cannot quite agree with Mr. West that because a man is a measurer he is a quantity surveyor. I agree with Mr. West as to the utter impracticability of issuing standard bills of quantities. I am also glad to gather from the remarks of Mr. Pietersen and others that there is such a general opinion that bills of quantities should form part of the contract. In conclusion, gentlemen, I beg to thank you most sincerely for the kind manner in which you have accorded me your thanks. I trust that such meetings as we had on December 6 of last year and this evening may have the effect of spurring us all on to further effort in the interests of our Association. Will you permit me to say that as I have not in the past spared any time or expense in advancing the objects our Association has in view, so in the future I shall always be pleased to give my best energies to the same end. Again, gentlemen, I thank you.

Upon the motion of Mr. L. G. CROSS, seconded by Mr. H. J. CAMP, an unanimous vote of thanks was passed to the Chairman, who responded, and the proceedings terminated.

No. 13 of the articles of association, to which so many references were made in the discussion, is as follows:—"Any member of the Association who shall supply bills of quantities holds himself responsible for their accuracy, and to pay for all losses caused by his errors therein (when called upon so to do by the aggrieved party). On the refusal of any member to recoup any loss, the Council shall, on the application of the aggrieved party, investigate the matter; and if the member refuses to pay any sum, they (the Council) may find to be due through his negligence, he shall be at once expelled from the Association, and shall not be eligible for re-election until the amount is paid.

"On an application being made to the Council to investigate any matter under this article, they shall consider what would be a reasonable sum to cover the cost of such inquiry, and the applicant shall guarantee the payment of such amount, and shall also pay to the Association such sum as the Council may think fit by way of deposit."

TESSERÆ.

Kilkenny Cathedral.

ALTHOUGH small in actual size, and particularly wanting in height if measured by the English standard, St. Canice is not merely a cathedral in its character, but one of considerable originality of design and of no little gracefulness in mass and in detail. The plan comprehends a choir, with aisles stopping sort of the sanctuary; a central lantern, low tower, transepts with gabled chapels eastwards—that to the south the longest—ranging with the choir aisles; a nave of five bays, with aisles and large south porch. There is, moreover, so close to the end of the south transept as almost to deserve to be reckoned as an integral portion of the structure, a round tower. The style throughout, excepting in the side windows of the sanctuary, which form on each side an equal Romanesque triplet, is First-Pointed, presenting some interesting peculiarities. The east window is a Pointed triplet of equal lights. The treatment of the south transept is peculiarly elegant, two lancets placed wide apart, and above a singularly pretty sexfoil, the whole spaced so as to combine unity of design with division of parts. The same artistic hand may be traced in the nave clerestory, consisting of rounded quatrefoils set lozengewise, of a large dimension and bold treatment, internally set in an ample rear-vault, externally, of course, flush with the wall. The form and size of the windows, which are very considerable compared with the entire height of the church, give to them a striking aspect and tend to create the cathedral character. Their effect is, for example, totally different from the small quatrefoil or round clerestories which are sometimes found in English parish churches. The aisle windows exhibit rudimental tracery in the form of lancets placed rather close together, with quatrefoils in the head, a close approximation to the two-light windows of Early Middle-Pointed. The pillars are rather short and thick, of a quatrefoil section, and made of the black marble of the country, bearing moulded arches. There is not even the rudiments of a triforium. The lantern is vaulted. The battlements, both of the church and of the tower, are bold and stepped, with a single grade in each. The whole building manifests unity of design, and yet the architecture of the Romanesque windows of the sanctuary on the one hand, and of the incipient two-light windows on the other in the nave, tell of a long interval of years. The historian of the cathedral will doubtless clear up the fact. It is certainly noticeable in a church exhibiting so much unity and simplicity of conception. Kilkenny Cathedral was of old famous for the beauty of its painted glass, so much so that Rinuccini, the nuncio who came over to Ireland during the civil wars of Charles I., was anxious to have purchased it, an offer which the patriotism of the citizens of Kilkenny refused to entertain, and so it has perished altogether.

Byzantine Churches.

It is curious how strong a prejudice exists against all idea of the beauty of Byzantine architecture. It seems to be regarded as a stiff corruption of heathen art, a "Jacobean" imitation of Grecian loveliness. That it has in itself the breath of Christian life; that it worked out its own developments; that piety of the deepest fervour and genius of the highest order were poured forth on its thousand temples; that the sublime dome was its own, that shrine raised to the Almighty above the din and the bustle of earth, of which perhaps we have not yet seen the full development—all this is unknown or forgotten. The man who will be affected even to tears with the Romanesque majesty of Peterborough or Treves will acknowledge condescendingly the barbaric splendour of S. Sophia or Cutais. As if there were a moment's comparison between the Western cathedral of the eleventh century, aspiring into Christianity, and the soaring arches and aerial dome of Byzantine glory. True: the parallel ceases with the first Western style. The succeeding epochs of Constantinopolitan art varied only so much from each other as Pisan, or Rhenish, or Lombard, differ from Norman Romanesque. There lacked the vigorous freshness which, in the West, bade old things to pass away; and though Servia at one time trembled on the verge of a Byzantine First-Pointed, the battle of Kossowa swept away her art and her kingdom together.

Decline of High Art.

The efficient cause why higher art at present is sunk to such a state of inactivity and languor that it may be doubted whether it will exist much longer is not a particular one, which private patronage or the will of an individual however great can remove, but a general cause, founded on the bent, the manners, habits, modes of a nation—and not of one nation alone, but of all who at present pretend to culture. Our age, when compared with former ages, has but little occasion for great works, and that is the reason why so few are produced. The ambition, activity and spirit of public life is shrunk to the minute detail of domestic arrangements—everything that surrounds us tends to show us in private, is become snug, less, narrow, petty, insignificant. We are not, perhaps, the less happy on account of all this; but from such selfish trifling to expect a system of art built on grandeur, without a total revolution, would only be less presumptuous than insane. What right have we to expect such a revolution in our favour? Let us advert for a moment to the enormous difference of difficulty between forming and amending the taste of a public. The fourteenth and fifteenth centuries granted to the artists little more than the attention due to ingenious craftsmen; they were, from the object of their occupations and the taste of their employers, the legitimate precursors of Michel Angelo and Raphael, who did no more than raise their style to the sublimity and pathos of the subject. These trod with loftier gait and bolder strides a path on which the former had sometimes stumbled, often crept, but always advanced. The public and the artist went hand in hand; but on what spot of Europe can the young artist of our day be placed to meet with circumstances equally favourable? Arm him, if you please, with the epic and dramatic powers of Michel Angelo and Raphael, where are the religious and civic establishments, where the temples and halls open to receive, where the public prepared to call them forth, to stimulate, to reward them?

GENERAL.

Mr. John Belcher, A.R.A., the president of the Architects' Benevolent Society, has received 50*l.* from Mr. Howard Chatfeild Clarke towards the 500*l.* which it is hoped may be raised in accordance with the terms of Mr. Walter Emden's offer of 50*l.* if nine other gentlemen contribute a like sum. So far, including Mr. Emden, there have been four responses to this appeal.

M. Tony Robert Fleury has been re-elected president of the Société des Artistes Français. M. Damant will serve as president of the jury of the section of architecture at this year's Salon.

An International Exhibition of works of painting and sculpture—the fourteenth of the kind—is now open at Monte Carlo.

The Foundation-stone of the Engineers' Club, New York, was laid on the 23rd ult. by Mrs. Andrew Carnegie. Among the documents deposited in the stone was the programme of the competition for designs, in which Messrs. Whitfield & King were successful.

The Birmingham Drainage Board have resolved to apply to the Local Government Board for authority to borrow 73,000*l.* for the construction of storm-water filters and the improvement of the present filters at Saltley.

Mr. T. T. Rees will read a paper on Monday before the Liverpool Architectural Society, entitled "The Laying-out of Streets, Buildings, Open Spaces, Parks, Planting of Trees, Advertising Hoarding and Smoke Nuisances."

At a Meeting of the committee of the Bishop Ellicott Memorial Fund held at the chapter-house of Gloucester Cathedral on Monday, it was reported that the Dean and Chapter had unanimously resolved that no monument of any kind could be placed in the choir of the cathedral. The Dean and Chapter also objected to anything in the shape of a tomb or cenotaph, but were prepared to admit a recumbent effigy in some other part of the cathedral. Bishop Ellicott stated in a memorandum that if he should be thought worthy of any memorial, what he should wish was simply a recumbent form in stone in the cathedral of Gloucester, similar in support and structure to the celebrated bracket tomb attributed to Abbot Serlo. This wish will probably be acted upon.

The Society for the Preservation of Ancient Works of Art have presented to the Birmingham Art Gallery three water-colour drawings by Mr. T. M. Rooke, R.W.S., of "The Château Faulin."

The Edinburgh Dean of Guild Court have for the first time granted a warrant for a building of ferro-concrete. The structure is a warehouse and factory, and will be erected according to the plans of Messrs. Cousin, Ormiston & Taylor.

The Senate of Cambridge University have accepted the offer of the Surveyors' Institution to establish three scholarships at the University of a value of 80*l.* each and tenable for three years. They will be open only to students of the Surveyors' Institution.

The Secretary of State for India will, in the summer of 1906, make ten appointments of assistant engineers to the Public Works Department of the Government of India. Graduates of the University who have obtained the degree of B.Sc. with honours in engineering will be eligible to compete for these appointments. Applications for the appointments must be made on a printed form to be obtained from the Secretary to the Judicial and Public Department, India Office, Whitehall, London, S.W.

The Edinburgh Town Council were recommended by sub-committees concerned that the plans for the new slaughter-houses should be obtained through competition, and not given over to the city superintendent's department. The Council have, however, decided to throw out this recommendation.

The Town Council of Ayr agreed last week with reference to the rebuilding of the "Auld Brig" and the legacy of 10,000*l.* left for the purpose of rebuilding, that they should not be expected to propose a compromise with the heirs-at-law with a view to getting an Act of Parliament authorising them to apply the fund or part of it to preservative works, and that the Council should not be asked to solicit subscriptions from the public for such works. It was further understood that in the event of the committee being successful in raising funds for the restoration of the bridge the Town Council would hand it over to them to carry out the proposed works as outlined by various eminent engineers; and it was further stated that the bequest fund would be available for the rebuilding of any part of the bridge if that were found necessary. The committee undertook, on that understanding, to take preliminary steps with a view to raising funds for their proposed operations on the bridge.

The Bradford Corporation have determined to purchase for the permanent gallery of that city works by the following artists, which were in the exhibition by the International Society of Sculptors, Painters and Gravers in the Cartwright Memorial Hall:—John Lavery, "A Lady in a Green Cloak"; the late Fantin Latour, "White Roses"; W. L. Bruckman, "Autumn in Sussex"; T. Stirling Lee, two marbles; A. George Walker, a relief in marble—"The Kiss." Also etchings by M. S. I. Bauer, D. Cameron, D. S. MacLaughlin, Oliver Hall and Joseph Pennell.

The Council of the Glasgow Institute of Architects, who, along with Mr. John Shields, are the trustees of the Alexander Thomson Memorial Travelling Studentship, have awarded the first prize of 60*l.* to Mr. James Whitelaw, Loancroft, Uddingston, and the second of 20*l.* to Mr. F. M. Craik, 136 Stanmore Road, Glasgow.

The West Riding County Council have empowered the education committee to authorise district sub-committees to select and negotiate for sites and to employ architects for the erection and alteration of provided schools in their area. It was stated that the work in the county architect's department was absolutely congested, and that out of forty-seven new schools which had been decided upon, and in regard to which the county architect was engaged, in only one instance had a brick been laid.

In Connection with the Watts Exhibition now being held at the Royal Hibernian Academy, Dublin, a series of lectures on his art will be delivered. The first was on Thursday, the 18th inst., by Mr. John B. Yeats, R.H.A., entitled "The Rationale of Art." The following Thursday Mr. W. B. Yeats will treat of "The Ideal in Art," and on Thursday, February 1, Mr. George Russell will lecture on "Art and Literature."

The Lower Austrian Trade Society are organising an international exhibition of building construction, to take place in Vienna in 1908.

Mr. A. Saxon Snell will deliver lectures before the Sanitary Institute. The first on March 19 will be "Building Materials," and the second on March 21 on "Sanitary Building Construction and Planning, Soil and Local Physical Conditions. On March 26 Mr. W. C. Tyndale will treat of "Sanitary Appliances," and on March 28 Mr. J. Wright Clarke of "Details of Plumbers' Work." On March 30 Mr. A. Saxon Snell will deliver a third lecture on "Ventilation, Warming and Lighting." Mr. W. C. Tyndale will treat of "House Drainage" on April 2.

Mr. Harry Withers Chubb, M.I.C.E., of Burlingham, Chislehurst, managing director of Messrs. Chubb & Maxwell, Ltd., and of Chubb & Sons Lock and Safe Company, Ltd., who died on December 2, aged forty-eight years, as the result of a fall on the staircase at the Colonial Office, left estate of the gross value of 36,574*l.* 15*s.* 4*d.*

The King of Italy, in connection with the Milan Exhibition, has instituted the following six international prizes for inventions:—1. 200*l.* for automatic coupling of waggons. 2. 200*l.* for a handy and simple apparatus allowing electrical labourers to assure themselves without danger of the presence of currents of high power in the conductors they must touch in their work. 3. 400*l.* for some improvement, some process of manufacture or some machine which may have actual merit or intrinsic value and character of novelty. 4. Prize of 200*l.* for the best organisation, shown by experience to be efficacious, for the provision of healthy, pure milk in populous centres. 5. 400*l.* for the best type of popular lodgings for the climate of Northern Italy. 6. 200*l.* for motor boats.

A Mock Arbitration Case relating to land near Highgate will be heard at the junior meeting of the Surveyors' Institution on Monday. Mr. H. Martin will be arbitrator, and the counsel are Messrs. S. A. Smith, C. H. Dinwiddy, J. D. Young and F. S. Chesterton. Witnesses will be called.

The T-Square Club's first meeting and invitation supper is to be held at the Monico restaurant, 46 Regent Street, Piccadilly Circus, W., on Tuesday next, the 23rd inst., at 6.30 P.M.

The Architect.

THE WEEK.

IT is to be regretted that the poor lady who bequeathed her property for the erection of a Gothic structure in a central part of London (which was to be a joy for ever) was declared to be of unsound mind, memory and understanding. It is of such rare occurrence for anyone to dream of creating a work of the kind, if the will had been carried out in a satisfactory manner other people might be disposed to imitate the testatrix. Miss LINA BEATRICE CLAYTON-BROWNE, whose will came before the Courts on Saturday last, died on March 24, 1904, in her thirty-second year. In August 1900 she had a will drawn up while staying in Windsor. In it she directed that after the payment of an annuity "the whole of the trust fund and the accumulations of income thereof were to be applied in the erection, without buying land, of an ornamental structure of Gothic design, such as a market cross or street crossing refuge in the style of a market cross, tall clock, street lamp stand, or all combined, in a central part of London, the plan whereof shall be offered for open competition and ultimately decided upon by the Royal Institute of British Architects, and I especially desire that no inscription of my name shall be placed on such erection. In connection with the construction of the said Gothic erection I would wish that no large masses of dark metal, such as dark bronze or cast-iron, or of dead white marble or alabaster should be used, whether as statues or otherwise, as I consider the effect of such large masses to be toneless and blurred, particularly in a moist climate. I should also like no pigment to be used upon any but an absolutely flat surface, and then but sparingly. In deciding upon the merits of the designs I should like particular value to be laid upon the general outline as seen from a good distance. I should like to be inscribed upon the structure in letters of a different tincture to that of the ground, such as bronze letters in marble or stone, the following inscription:—'Many and munificent are the gifts ministering to the ills of the flesh, therefore is this structure dedicated merely to the more neglected gladdening of the eye.' 'A thing of beauty is a joy for ever.' . . . ." If the words were not those of the lady herself there is no question that her intentions were expressed in it, for the solicitor stated she gave him instructions in an exceedingly sensible manner. The value of the estate was about 12,500*l.* Various acts were proved which were sufficient to show that on other occasions the lady's mind was affected. The President of the Probate Court was satisfied, from the evidence, that he must pronounce against the will, and a central part of London has therefore lost an ornament.

THROUGH the efforts of the National Art Collections Fund the *Venus and Cupid* by VELASQUEZ has been acquired. There is a balance of 3,000*l.* owing to Messrs. AGNEW, but they have allowed time for its collection. The picture is now on exhibition in Manchester. However, it will be handed over to the Fund next month. The picture was purchased in 1813 by Mr. MORRITT, of Rokeby Park, for 500*l.* It was exhibited in Manchester in 1857. The only expert of note who then gave any attention to it was the French critic THORÉ, who is known as W. BURGER. The picture was, he said, placed high in the gallery at Manchester, owing, he supposed, to English prudery. BURGER declared it was impossible to imagine a line more gracious than that which extends from the neck along the figure. He says there is something of WATTEAU to be seen in the elegant form, and if WATTEAU had painted bathers of life-size they would have resembled VELASQUEZ's *Venus*. The grey drapery on which the woman lies was, in his opinion, invented as a contrast to the white linen covering the bed and to bring out the flesh tints in the fullest light. The same colour is behind the head, and there are large folds of a sombre red curtain behind the Cupid. It is the figure of the god which has made the woman to be accepted as a Venus, otherwise she would be simply a sleeper or a dreamer. For quality of colour or harmony, the critic believed VELASQUEZ never produced anything more distinguished. It was not, however, possible in Manchester or at any subsequent exhibition to study the picture properly. The removal of the varnish and dirt now allows the figure to be seen as it was left by the Spanish master.

SEVEN judges in the Court of Session, Edinburgh, would appear to have discovered a flaw in the Workmen's Compensation Act which hitherto was unnoticed. Messrs. EASTON & SONS, plasterers, of Bathgate, employed a carter, who was injured in their service. Claims under the Act can in England be determined by arbitration, and a memorandum is to be sent to the Registrar of the County Court for the district, which is to be recorded without fee and to be enforceable as a County Court judgment. In Scotland a Sheriff Court takes the place of an English County Court. In the Scottish case a memorandum of agreement was given to the sheriff-clerk for record. But as the employers disputed its genuineness he declined to record it. Application was made in due course to the Sheriff Substitute and to the Sheriff, but without avail. Then the carter applied to the higher Court, but a plea was entered on behalf of the employers that it was incompetent in such a case to appeal to the Court of Session. Five of the seven judges held that there could be no appeal to the Court. The Lord President declared that the matter was "a gigantic blunder," for a misprint had found its way into the Bill after it had been passed by the House of Commons. His lordship said that the true provision for the enforcement of agreements was that contained in subsection B, section 14, and it was apparent that paragraph 7 of the schedule should have been paragraph 8. The Scottish judges evidently maintain that arbitration is the remedy offered for disputes by the Act, and that registration is not a judicial act.

ANYONE who wishes to become acquainted with the history of Paris without much labour will succeed by one or more visits to the Musée Carnavalet. As a building it is associated with JEAN BULLANT, DU CERCEAU and MANSART. The figures on the front are supposed to be the work of JEAN GOUJON. At one time it was the residence of Madame DE SÉVIGNÉ and her daughter. Since it was purchased by the municipality of Paris it has been converted into the historical museum of the city. So many objects are from time to time presented to the museum, it has become necessary to enlarge the buildings. Plans have been prepared by MM. BROUSSE and BOUVARD, and the works will be commenced as soon as possible. Part of the funds for the purpose has been acquired under rather novel circumstances. The Council had purchased another ancient residence, the Hôtel Lauzun. The son of the proprietor has persuaded the Council to part with the building, and in return he will pay 350,000 francs, which will be used for the enlargement of the Musée Carnavalet.

FROM the praise so often given to the skilful construction of French buildings it might be imagined that they have immunity from all fire risks. They can at times suffer like buildings elsewhere. A week ago the Palais de Justice at Belfort succumbed to a fire which was caused by the heating apparatus inflaming wood which was near it in the basement. The building was erected as lately as 1901, and was therefore sound. Only the main walls are standing. The records of the different tribunals were saved, except those of the Tribunal of Commerce prior to 1896, which were destroyed. The building was insured.

THE ECONOMY OF DORIC.

IT is impossible to say when the Greeks began to erect temples of stone or even temples of wood. The people who were described by HOMER and who came from different parts of Greece, although they respected gods and goddesses according to the support received from them, contrived to dispense with such buildings. If we can accept HERODOTUS, the Greeks derived the religious ceremonies to which temples were adjuncts from the Egyptians. "The first inventors of festivals, ceremonies and transactions with the gods by the mediation of others," he says, "were the Egyptians, all which I persuade myself the Grecians received from that people." This belief he expresses in more than one place.

It is remarkable, however, that if rites were derived from the Egyptians the Greeks did not endeavour to imitate the Egyptian temples, which, from their grandiose character, must have exercised an important influence in elevating the character of the ceremonies. If we assume that the Doric column was derived from Beni-Hasân, it is strange that further indebtedness did not occur. There were columns of another kind, which the Greeks must have seen, that were infinitely more imposing. But they were avoided. One can hardly believe, too, that the Doric column would have been so generally adopted in Greece if it were a foreign importation. The name applied to it and its character are suggestive of the Dorian race, who unquestionably were long respected as if they were the grand old Tories of a country which was becoming more and more Liberal and Asiatic in its ways.

It would have been an impossibility for the Greeks to have gone far in imitation of the Egyptian style. It was too costly for their resources. In dealing with the ancient architecture of Greece critics are supposed to consider buildings under many aspects, but they are without concern for what is the most important of all, viz. that of cost and finding money to meet the expenditure. Egypt, so far as we know, was ruled by despots. We learn from the Bible that hordes of men were compelled to work for what are called in modern times starvation wages. The whip and the cudgel appear in so many representations we must conclude that overseers were able to utilise all the strength possessed by the labourers. No doubt large numbers succumbed during the operations required for the erection of one of the great temples or tombs, but other unfortunates were readily found to take their place.

Greece, on the contrary, was merely a geographical expression. It was divided into numerous petty states, and in each there existed a limitation to the powers of the rulers. It was only under exceptional circumstances that they could be induced to co-operate for a general purpose. It is therefore misleading to present buildings like those of Olympia or Delphi as if they were examples of local endeavour, for they were in reality extraordinary efforts on the part of disunited Greece. When KEATS asked,

> What little town by river or sea-shore,
> Or mountain-built with peaceful citadel,
> Is emptied of its folk, this pious morn?

he was suggesting the character of Greece and its religious festivals. The little towns, each having independence, were so closely situated that Colonel MURE found he was able to visit four places celebrated by HOMER during a ride of twelve hours. Each would no doubt possess its temple, and there could be no more economical model than what is known as the Doric temple. In saying this it must not be supposed that the Parthenon was the typical or normal temple. It arose under peculiar circumstances which were never repeated in Greece; and, indeed, it might be said that if it were not for sharp practice which came very near to dishonesty the Parthenon would never have been erected, or if a new temple to ATHENÉ became indispensable it must have been of a less unique character.

Sceptics are doubtful about the connection between the Dorians and the Doric Order. But there is no reason to suppose that with all their peculiarities and indifference to various forms of art, that people could not erect a simple temple. It was necessary that, like all Lacedæmonian buildings, it should be simple and cheap. PLUTARCH, in writing of LYCURGUS, says that one of his ordinances, which were levelled against magnificence and expense, directed that the ceilings of houses should be wrought with no tool but the axe and the doors with nothing but the saw. In other parts of Greece the ceiling was probably the most ornamental part of the room, because while guests were reclining its details could be studied. The Spartan who pointed to the ceiling and asked his host in Corinth whether trees had square trunks suggested a difference between the two great divisions of Greeks, viz. Dorians and Ionians. What was true of the ceiling was true of other parts of the house, and those of the Dorians were of the simplest class. Many of them must have resembled colonial log-houses or shâcks. It was impossible to have fine architecture with such restrictions. But any man who was able to construct a house would have been competent to erect a primitive temple for the Dorians. Even in an advanced period, the planning offered few difficulties in any part of Greece. There was no necessity to accommodate a congregation, and a Greek temple may be said to resemble a modern sacristy rather than a church. Some have supposed that a temple at its best was no more than a reproduction in stone of a primitive timber hut. The economy with which a building of the kind was erected was demonstrated by the number of imitations of Greek temples erected during the past century in English towns to serve for chapels and meeting-houses. It certainly is creditable to the Greeks that they upheld the form of their temples to the last and resisted all temptations to adopt a different plan. That, no doubt, might arise from poverty. But the Roman emperors with unlimited money at their command respected the *genus loci* and built in the Greek manner.

It is sometimes complained in modern times by projectors of churches that in districts where houses are costly the church is of a mean character. An objection of that kind could never be raised in Greece. Even great men seemed to be indifferent to what we know as comforts, and were content with tumble-down dwellings. There need be no better proof of the character of the domestic architecture than the words used to signify the burglar. He was known as *toichoruchos*=wall-borer, or as *toichoruktes*=a wall underminer; in other words, there was no difficulty for a member of what DONNEGAN calls the profession of a burglar, by the exercise of a little force, to enter a house at the side or beneath it. One of the consequences was that several men adopted that mode of earning a livelihood, for the Spartans were not the only Greeks who were trained in stealing and living at the expense of others. Some compensation for bad building was found in the temples which were the safe-deposits of the Greeks. If unadorned they were at least strongly built with massive masonry beneath. Burglars, it is supposed, were afraid of breaking into and stealing from a sacred place. That was another reason for excluding people in general from the interiors of temples. As they were only allowed to gaze on the exterior or peep through one of the doors, they were spared the temptation to attach public or private treasures.

We believe that many Greek temples were of a kind which was not beyond the means of one of those little towns which KEATS had before his mind's eye when writing about a Greek urn. Large and small buildings were so nearly alike in architectural character, it might well be imagined they were equally acceptable to the divinities. It will, of course, be said that although the columns, pediments, metopes, &c., did not differ much in form, yet the sculpture was able to impart dignity which elevated costly buildings above those of a

Digitized by Google

humble kind. There is no certainty that sculpture was always considered an indispensable adjunct to a temple. There are Sicilian temples which date from an early age, and which are most impressive, though there is no trace of sculpture on frieze or pediment. Sculpture was undoubtedly an important accessory in a Greek temple, and it afforded pleasure to those who were compelled to remain outside the building. But it must be allowed that Doric temples from which nearly all the figures have been removed continue to be interesting through the effect of the architectural lines. With the Greeks, as in modern times, sculpture of a superior quality was costly, and, as we have remarked above, the Parthenon owes its existence to extraordinary circumstances which did not find approval among all the Athenians of the time.

The people charged PERICLES, who then ruled, with having brought disgrace upon them by removing the public treasure (10,000 talents) of the allies from Delos and retaining it in his possession; no doubt the Greeks were insulted by seeing money which had been collected to meet the expenses of a war lavished on statues and temples for Athens. PERICLES met this boldly by saying that the Athenians were not compelled to furnish an account of how the money was expended; that the allies had been defended, and therefore that the Athenians were entitled to use the money obtained for defence in any way they pleased; that the men employed in constructing great edifices and other works of art had as much right for consideration as soldiers and sailors. These were specious arguments, and it is evident from the extraordinary haste employed in the execution of the new works at Athens that PERICLES was afraid he would have to yield the money. "If I boast," said ZEUXIS, "it will be of the slowness with which I finish my work"—a saying which the modern British workman appears to have adopted as a guide. The people of Athens were fond of leisurely occupation, and they wondered when they saw such remarkable structures erected in so limited a time, especially when it appeared as if antiquity and modernity were united in them.

Such lavish outlay was contrary to the Greek spirit, and was peculiarly out of place with a Doric building. The works, however, revealed what could be done for the improvement of a city in which it might be supposed that any change would be destructive of its character. It was believed that 1,000 talents were expended on the Parthenon alone, an unprecedented amount, but it is impossible to discover what proportion of that sum was laid out on the marbles which are now in the British Museum. The sacrifices which PERICLES compelled the Greek allies to undergo for the sake of Athens created enmity throughout Greece. The Athenians having unexpectedly received money from the public treasury clamoured for more, and when it was not forthcoming they made charges against PERICLES. The whole history of the transaction suggests that the old system of raising temples had been departed from, and although Athens was beautified by the extravagance—for nearly the whole 10,000 talents of the Panhellenistic treasury were disbursed—the people considered that NEMESIS would not permit the innovations to remain unpunished, although they were supposed to be performed in honour of ATHENÉ.

Professor S. H. Capper arranged to give two free public lectures at the University of Manchester (Department of Architecture) on "Ancient Building Construction." The date of the second lecture is January 31.

A Sub-Committee of the Lord Provost's committee of the Edinburgh Town Council last week visited Greyfriars Churchyard, Princes Street Gardens and the Calton Hill, for the purpose of making an inspection of the public monuments. The latter are in many cases showing the effects of the weather, and it was with the object of considering how to secure their preservation that the inspection was made.

ENGLISH CATHEDRALS.*

THE second series of Mr. BUMPUS's descriptions comprises the cathedrals of Canterbury, York, St. Paul's, Winchester, Norwich, Peterborough, Exeter and Wells. He would be a courageous man who would endeavour to assess their respective values. Each of them includes features which are unmatched. Although one of them is a departure from what we might almost call the natural style of an English cathedral, it is better as it is than if it had been a seventeenth-century improvement on its predecessor. It must have been the English Mediæval cathedrals and not those of any other country the late Cardinal NEWMAN had in his mind when he said:—"For myself, certainly, I think that that which, whatever be its origin, is called Gothic, is endowed with a profound and a commanding beauty such as no other style possesses with which we are acquainted, and which probably the Church will not see surpassed till it attain to the Celestial City." These words were written by a man who at the time was engaged in carrying out the behests of the POPE and who felt peculiar affection for Roman buildings. But the Renaissance, although adopted for the foremost of churches, was not so satisfactory to the old logician as English Mediæval work, for, as he said, "No other architecture, now used for sacred purposes, seems to be the growth of an idea, whereas the Gothic style is as harmonious and as intellectual as it is graceful." It is, however, unnecessary to have recourse to either literary or artistic authorities concerning the value of English cathedrals. They are their own expounents, and their power has been exercised not only on Americans, Australians and Canadians, but on foreigners. They suffer under the disadvantage of being used for services of a kind which were unknown to the architects who designed them. But in spite of this unfitness they possess other qualities which are irresistible.

It is not to be expected that any new discoveries will be made concerning the history of English cathedrals, and Mr. BUMPUS is therefore obliged to follow several predecessors when he describes the fabrics. But, as he is fortunately endowed with an enviable love of stained glass and of music, he is, as we have before pointed out, able to give attention to subjects which other writers treated as if they were of minor importance. Thus, in discussing the windows of Canterbury, we find the following anecdote of GERENTE, which may be new to many:—

During his visit to England in 1847, Henri Gerente, the distinguished French glass-painter (who had been sent to Oxford by the Government of Louis Philippe to examine a very valuable collection of drawings of architectural and monumental remains which, after having been made for the French Crown, had, in consequence of the great revolution, found its way into the Doucean collection), wished to take tracings of this thirteenth-century glass at Canterbury. But, to his great and just indignation, he was refused permission to exercise his pencil within the walls of the cathedral; indeed, it was only in consequence of its being in question that he was to work for the church that he was, but a very short time before his death, enabled to obtain the sought-for permission. On coming to examine and make his tracings of this glass, which he thought he could prove to be by the very same artist as the unrivalled windows in the pourtour of Sens Cathedral, one of which illustrates the history of Becket, Gerente found it in such a state that the substance could be scraped off to a considerable depth with the finger-nails.

In York there is much to gratify all lovers of stained glass. In describing the grisaille work of the Five Sisters, Mr. BUMPUS recalls that Salisbury Cathedral was entirely filled with similar glass. But under WYATT workmen were employed to remove it in order that the lead bands might be melted. PECKITT, who in the eighteenth century was working in York, is described by Mr. BUMPUS as "forming a link between

---

Digitized by Google

the VAN LINGES, GREENBURY, GILES and the PRICES of the Stuart and Early Hanoverian periods, and WILLEMENT, WAILES and HARDMAN of the Gothic Revival." St. Paul's is not remarkable for its stained glass. But at an early time JOSHUA PRICE offered to adorn the upper window towards the east with a figure of St. PAUL and ornament for 150*l.* The proposal was not accepted, and the cathedral was without stained glass until 1867. THORNHILL prepared sketches for the pendentives of the dome which were afterwards secured by WILLIAM BURGES, and some were published in *The Architect*. The modern mosaic which is seen in the apse and the quarter-domes is said by Mr. BUMPUS to be most gorgeous. But, he adds, "all who are possessed of any sense of the importance of architectural consistency of style and feeling must acknowledge that, chronologically considered, the adoption of these designs has been, to put it in the mildest form, a fatal mistake."

The organ in Winchester Cathedral was, it appears, erected by a man named AVERY, who must have been a Bohemian of an unusual type. He used to take pipes from one of his organs and use them elsewhere. At length he died in Giltspur Street prison, and was buried in St. Sepulchre's at the expense of his workmen. Dr. WESLEY, the organist, proposed that the present instrument should be placed upon the choir screen. The cathedral has had the advantage of the services of several able musicians. The restoration of the great screen by Messrs. FARMER & BRINDLEY receives merited praise.

In Norwich much attention was also given to the choir. Dr. Z. BUCK, who was organist from 1819-77, was evidently a humourist, but he was a good drillmaster for the boys. Peterborough now possesses an organ which was presented by an anonymous donor at a cost of 4,400*l.* There is on record an account of a visit to the cathedral in 1786. At that time the keys of the organ "were so worn that it was like putting your fingers into a row of ivory spoons." In regard to the improvement of choirs and instruments, there can be no question of modern progress. At a time when elsewhere there was neglect the services in Exeter Cathedral were conducted with dignity and decorum. Here also the influence of Dr. WESLEY was exercised. The choristers at Wells must at the beginning of last century have had a license which, it is to be hoped, was unique. TURLE, who was for so long connected with Westminster Abbey as organist, was in early life one of the singing boys, and he related that the nave was a recognised playground. He remembered having driven a stone through one of the stained-glass windows and injured a figure of St. ANDREW.

It must not be supposed that Mr. BUMPUS confines himself to music or stained glass. We have referred to those parts of his book because they help to give it a personal character, but the histories and descriptions are well adapted for the use of visitors to the cathedrals and to the students of ecclesiastical history. The volume is illustrated by photographs.

VENTILATION, HEATING AND LIGHTING.*

THE comfort of a dwelling in a large measure depends on the subjects which Mr. J. W. THOMAS has treated in his new volume. They have interest, therefore, for every man and woman. The author wisely appeals to people in general rather than to those who may have only a special or technical interest in the means which are required for ventilation, warming and lighting. It might be announced that the pages are addressed mainly to those who are about to become tenants and purchasers of houses. Mr. THOMAS, in fact, often descends from his professional elevation and speaks as one resident in a villa might do to a friend who wished to become a neighbour. The defects which are likely to exist are pointed out and suggestions are offered for their removal. The book has therefore many advantages and merits to be widely circulated.

There is no use in denying that many people when they take up their residence, in new houses especially, are disappointed when they find inconveniences of various kinds awaiting them. It is not only in long terraces which have been erected with expedition that annoyances have to be encountered. Mr. THOMAS tells us that he found "on a recent visit to Sandringham that cowls and long tubes had been added to nearly half of the chimneys on the newer portion of the KING'S residence, with a view to stop the fires smoking, whilst the chimneys on the older portion of the building were not so disfigured." Chimney-cowls of fantastic shapes can be observed in the principal streets of London and in continental cities also. Indeed, some people believe that their use is inevitable. There is so much concerned in combustion it is only by experience that the best way of escaping annoyance can be arrived at. In referring to some colleges in Oxford Mr. THOMAS tells us that where the flues are not more than 9 inches by 9 inches they do not smoke, while those of a smaller size smoke badly. But he mentions one college for girls "in which two rooms are allocated to each student, but being badly placed as to wind suction upon the inlets, and the grates being faulty, the ventilation requires much watchfulness to make them habitable."

This last sentence suggests one peculiarity of Mr. THOMAS'S method. In books of a similar kind it is assumed that as nature abhors a vacuum there is air everywhere, but as it is invisible it is supposed to work in a volume, we might say, almost stupidly, and therefore has few qualities. Mr. THOMAS believes that we have not discovered all the conditions which belong to air because there may be some of an electrical kind which have yet to be revealed. But he has observed enough about air to treat it as if it were almost a living thing. DICKENS, in his "Martin Chuzzlewit" and in one of his Christmas stories, represented wind as if it possessed some human qualities. Mr. THOMAS does not, of course, go so far, but he explains that even in an ordinary house we have to deal with a force which may become a friend or a foe. Here, for instance, is a passage which explains some of the shortcomings which visitors have found in houses when they take a holiday at the seaside:—

> The writer prefers seaside resorts which have bold natural beauties, and so usually visits those places situated on high cliffs. From a careful study of the wind's action upon the front of the cliff or terrace, and the subsequent effects upon the chimneys of the houses, the reason of one of the unpleasant experiences often observed when the wind blew stiffly became evident. It was found that the houses on the front facing the sea were generally connected to the main drain which ran along the promenade and eventually joined the outfall sewer, which was led some distance into the sea. No matter what the state of the tide the smell from the drains could be observed when the wind blew towards, or at right angles to, the high sea-front, and in many towns several of the manholes and air-shafts had to be closed carefully, as the smell was so intolerable. This emission of gas from the drains was attributed to the wind pressing against the mouth of the outfall sewer and the gases being forced inland in consequence. The writer was never satisfied with the explanation because the outfall sewer is rarely exposed at any seaside resort even at ordinary low tide. After noting the upward twist and suction caused by the wind impinging against the front of a cliff the reason for the offensive exhalations from the drains was explained—the gases were sucked out of the drains instead of being forced out by the wind. The sanitary authorities at seaside towns situated as described do not fully realise the grave dangers which may result in consequence of this suction of gases from sewer ventilators and the swirl which results from the wind's action near the ground level. For instance, let us suppose a gust of wind is blowing against the cliff; the suction upon the drains

* *The Ventilation, Heating and Lighting of Dwellings.* By J. W. Thomas, F.I.C., F.C.S., Scientist in Ventilation and Heating. (London: Longmans, Green & Co.)

Digitized by Google

along the front or for 100 yards inland perhaps is considerable. The next moment the gust ceases, and as there is a partial vacuum formed over the area mentioned the air is instantly drawn back, the consequence being that the gases from the drains which had been drawn upward descend and flow along the road and into the houses.

The unexpected effect of wind acting on buildings is explained in other parts of the book, and all who have to build houses in exposed situations should be acquainted with Mr. THOMAS's conclusions. For instance, it is pointed out that occasionally the wind blowing over the top of a soil-pipe causes a suction sufficiently powerful to depress the water by oscillation in the water-closets, and on that account the top of the tube should not be left unprotected.

The subject of grates and stoves is considered at length. Mr. THOMAS, however, believes in the superior advantages of heating by hot-water or hot-air. For lighting he favours electricity. In his own house he has lights throughout, "using the lowest candle-power lamps of higher voltage than the current so as to consume less. The charge is *6d.* a unit, but for twenty-eight lamps and three plugs the year's bill is only *7l. 7s. 8d.*" The book, which is largely inspired by the author's own experience, is well adapted for general use and should be found on the bookshelves of every careful householder.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Mr. John Belcher, A.R.A., president, in the chair.

Deed of Award of Prizes and Studentships, 1905-6.

The INSTITUTE SILVER MEDAL and 25 Guineas (essays). Subject: Biography of a British architect (deceased) practising in the nineteenth century. Six essays were submitted, the medal being awarded to Mr. W. H. Godfrey, 11 Carteret Street, Queen Anne's Gate, S.W., Mr. M. Shaw Briggs, of Otley, Yorkshire, and Mr. A. E. Bullock, of Chiswick, gaining certificates of honourable mention.

INSTITUTE SILVER MEDAL and 10 Guineas (drawings). Subject: Measured drawings of ancient buildings in the United Kingdom or Abroad. Fifteen competitors submitted drawings, the award going to six strainers (Hampton Court Palace), Mr. A. E. Poley, Willowbank, Hampton Hill, and Mr. G. J. Coombs, of Portman Road, Boscombe, five strainers (Christchurch Priory, Hants). The work of these two competitors was so equal in merit that the Council awarded both of them silver medals. Mr. P. W. Lovell, Hampstead Lane, Highgate, secured a certificate.

The SOANE MEDALLION of *100l.* (for continental travel). Subject: Realisation of the ideal mansion described in Bacon's "Essay of Building." This competition, which attracted ten sets of drawings, was gained by Mr. W. S. George, Oakenclough, Limehurst, Ashton-under-Lyne, a certificate of honourable mention and ten guineas being awarded to Mr. Robert Atkinson (Nottingham).

OWEN JONES STUDENTSHIP, Certificate and *100l.* (for travel and study of colour). Five applications with drawings were received. Mr. Chas. Gascoyne, Gray's Inn Square, W.C., gained the award, Mr. W. J. Davies, Thornton Dene, Sidcup Park, Kent; Mr. A. R. H. Jackson, Royal College of Art, Kensington, and Mr. A. D. Nicholson, Park Grove Terrace, Glasgow West, each securing prizes of 5 guineas.

PUGIN STUDENTSHIP: SILVER MEDAL and *40l.* (for travel in the United Kingdom). Twelve sets of drawings were received, the medal being gained by the six strainers of Mr. G. Drysdale. Mr. Jordan Green, South Road, Handsworth, Birmingham, was awarded a certificate of honourable mention.

GODWIN BURSARY: SILVER MEDAL and *65l.* (for travel outside the United Kingdom). Applications and drawings were submitted by five competitors, those by Mr. H. Inigo Triggs, of Bedford Park, London, receiving the award.

The TITE PRIZE: CERTIFICATE and *30l.* (for travel in Italy). Subject: Design (according to the principles of Palladio, Vignola, Wren or Chambers) for an open-air swimming-bath with an arcaded or colonnaded enclosure. Twenty-one sets of drawings were received, the prize being awarded to Mr. A. G. Horsnell, South Primrose Hill, Chelmsford; a medal of merit to Mr. C. B. Pearson, Cheapside, Lancaster; and a certificate of hon. mention to Mr. C. L. Wright, Bolingbroke Road, West Kensington.

ARTHUR CATES PRIZE: *40l.* Mr. John H. Markham, of Glenbrook Road, West Hampstead, the sole competitor, was successful.

The GRISSELL GOLD MEDAL and 10 Guineas (for design and construction). Subject: Design for stone skew bridge. Six designs were submitted, Mr. G. Nott, of Market Street, Leicester, securing the award.

ASHPITEL PRIZE. Mr. J. H. Markham, Glenbrook Road, West Hampstead.

A PRIZE to the value of *10l.* was awarded to Mr. A. R. Myers, Bruntsfield Place, Edinburgh, in recognition of his work at the special examination in November, 1905.

Three papers were read by Mr. John M. Swan, R.A., Mr. Montague Fordham, M.A., and Mr. Walter Gilbert on

Metalwork.

Mr. JOHN M. SWAN, R.A., in his paper, apologised for the frequent allusions he was going to make to ancient art. He was so far penetrated by a profound reverence for the past that he felt we were but pigmies peeping through the legs of the Colossus of antiquity. The thought of the Colossus of Rhodes that strode across the harbour where ships sailed out and in, and of Bartholdi's magnificent statue of Liberty at the entrance to New York Harbour, made him wonder when a statue of Britannia would arise from the waves in bronze of colossal form in the same spirit of antiquity, and emblematical of ourselves and of the sea-girt isle to which we owe our greatness and power. Since the eighth century Japan had produced a series of colossal works in bronze, the most notable being the Daibutsu, a seated figure 53 feet high, breadth of face 9 feet 4 inches. The processes employed by the ancients are so shrouded in mystery and so difficult to verify that we cannot at this distance speak with absolute certainty or form a clear judgment upon them. All the varying changes of colour mentioned by the ancients are occasioned by the nature of the alloys. Many metals combine together when melted, and only remain in union within certain ranges of temperature by reason of the wide differences of their melting and solidifying points. In ancient bronze the proportions of tin mixed with brass or copper and of copper with silver seem to have been—copper 71 to 87 parts, tin 3 to 6 parts, lead 4 to 21 parts. There are also traces of iron. With ourselves in ordinary bronze, 96 copper and 4 of tin are generally used. The Japanese are the real authorities for treatment of colour in metals to-day. They combine such extraordinary manipulative skill with artistic taste in carrying out any imaginative work. The superiority of French workmanship is doubtless due to their fine artistic instinct allied to their excellent art training. The Persian and Arabian metalwork with large plain surfaces of copper and brass might, treated in a bas-relief manner, be well adapted by ourselves for panel treatment for interior decoration. Describing the process of casting in cera perduta, which we get from Benvenuto Cellini, the author recalled that it is now about twenty years since the first cera perduta castings were made in this country. First, an ordinary piece mould or gelatine mould is made from the plaster model. Then a wax casting is run from the mould, to which are attached the runners and gates for the flow of metal and vents for air or gases. Afterwards the wax is cored, and an external covering-in mould covers the whole. It is then placed in a muffle or furnace, the wax melted out, and when the mould is dry the metal is passed in that replaces the wax model. The founders' wax is made of Gambia, Italian or native beeswax and resin coloured with vegetable matter or vermilion. The colouring of the wax is important, as if some metallic pigment or earth colour were employed it would cause a residue in melting out that would destroy the casting. Speaking of the bronze statues of London, Mr. Swan said everybody must be struck by their uniform dull, heavy, monotonous black. It was a most unsatisfactory state of things for both public and artist. Was it not possible in metallurgy to discover an unchangeable alloy? The black coats of Landseer's lions in Trafalgar Square do not recall the orange tawny glow of the king of beasts. The author expressed his preference in many cases for gilded statues or monuments that would better resist the action of the atmosphere and have a more decorative effect. They might appear too garish at first, but London fog would soon tone the surface and take off the glare of new gilding. Fine colour is a source of joy to us all; certain it is that a gilded statue, assuming the artist's conception a beautiful creation, would

Digitized by Google

appear as a sunbeam in our streets in the dull foggy weather, and in the summer, in sunshine with blue skies overhead, would be a joy for ever. The "noble rust," the antique patina, is not naturally formed in the atmosphere of London, or our statues of malachite and copper domes would be a delightful green. The author hoped no more of their ancient landmarks in London would be removed, lamenting especially the old-time Lion of Northumberland House and the old familiar figure of the Duke of Wellington at Hyde Park Corner. He should like to see Boehm's statue of the Duke higher up. Whenever he took his walks abroad he cast his eyes around for fountains playing in the sun-baked square, the whirl of pigeons, the flower patches; he was always looking for them, also for some decorative groups as a relief from the historical personage on a pedestal—something to relieve the dull ache of town and the monotony of heroes in trousers. Bronze bas-relief or gilt bronze in relief on marble should be fine as a decoration—even with us. He did not see why we should have less devotion for our heroes by giving them a more beautiful decorative aspect or less feeling for our architectural surroundings. Colour would be subservient to sculpture and a glorious handmaid to architecture; the charm of mosaic is capable of wedding a beautiful monumental design; at present our monuments are barren of colour, especially deficient in treatment of the pedestals and bases. What can be more unsympathetic than the basins of the fountains of Trafalgar Square? Here is room for the sculptor as designer and play of coloured metals and water. Gilded bronze can work in unison with black bronze, and aluminium may be looked after, so that it does not become the uniform London black.

Mr. Montague Fordham said he was anxious to draw architects down into the workshops, which would have the double advantage of giving them more knowledge of the actual treatment of metal and of creating a closer bond between architect and craftsman. With this object he gave particulars of the tools used in the ordinary working of copper, bronze and iron, and followed with some notes on the nature of the metals and their proper treatment. Having discussed the technical side of his subject, and shown examples of the admirable work produced by craftsmen of the day, he referred to the want of encouragement the craftsmen received from architects, who rarely entrust their metalwork to craftsmen, but deal with trade firms. Doubtless this was much less trouble. A trade firm employs a traveller, who is at the architect's beck and call, who will supply a design in any manner, adapt it for any metal, and cut his work down to any price. How was the designer-craftsman, the master-craftsman, who could turn out magnificent work under different conditions, to compete with such a system? He doubted whether any self-respecting craftsman would employ a traveller, neither should the architect expect it. If the architect would give the craftsman the slightest encouragement he would gladly place at the architect's disposal the result of his practical study and knowledge. The craftsman worked with the definite ideal of a revival of the crafts, and aimed at producing a really beautiful piece of work. There was no reason why the metal craftsman should not be as trustworthy in his arrangements as the ordinary man of business. They had got over the disease of their youth, the so-called artistic temperament, and had business organisation to support them. Again, the normal prices of the metal craftsman need be no higher than the ordinary trade price. If architects invited the craftsmen to help them in the detail of their metalwork, they would, whilst taking their share in the work of the revival of the crafts, obtain at the same time an undoubted distinction of detail in their work. This type of distinction he feared trade firms could not give, for the very essence of the difference between good work and poor work lay only partially in the design, and largely in the conditions under which it is carried out and the spirit in which it is made. It was a question of methods of organisation and of workshop inspiration: for example, in relation to such work as altar-crosses, chalices, &c., used for a definite religious purpose, it was of the utmost importance to realise that unless the workshop and men were embued with some element of inspired enthusiasm the work would always be an artistic failure. The matter of the revival of metalwork rested largely with the architects. It was for them to say whether the small industries now growing slowly were to be allowed to flourish; if so, he felt great hope that the present century would become famous in all time for the distinction of its metalwork.

Mr. Walter Gilbert, whose paper was entitled "Romance in Metalwork," confessed his inability to show any fresh views of the art of metalwork, but he would endeavour to explain a little of that impulse which urged the artist to find expression in those methods and materials with which he felt in most sympathy, and which had the most influence in the development of the art. Primarily it is imagination, or rather the consciousness of imagination—the ruling faculty in all art—which creates art. But real art is something more than this: it is imagination allied with skill and dexterity in the creation of beauty. Beauty is the criterion of all art, the object of all human longing and a source of human enjoyment. It is, but to the most sordid and debased, the great desire and the unfailing source of pleasure, and in such measure as the intellect is trained will that enjoyment be. The perfect work of art is always the result of some emotional mood, and that work is the most perfect which conveys the dream of the artist most successfully and most fully. Treating of the influence at work amongst the metalworkers of the Greeks and Romans, of the Gothic period and the masters of the Renaissance, the author showed that the Greek metalworker or sculptor never sought nor received inspiration from plant forms—nothing of this is found in his art, save perhaps an occasional subordinate sprig of foliage, for the perfect art must always possess the sensual element of beauty to attract and retain attention. If the Roman loved the bay and the vine it was not because of their plant form, but because the bay spoke to him of conquest, and the vine was synonymous with the worship of Bacchus, and all that revelry and riot of the empire which succeeded the severity and serenity of the Consulate years. Studying some of the beautiful little bronzes in the Pierpoint Morgan and other collections in the South Kensington Museum, the author had been amazed at the extent to which the imagination of the great Italian and other masters of the Renaissance had been stirred by the purpose of the objects they had so lovingly and carefully designed. Yet theirs was no original treatment. Just as Petrarch and Ariosto were inspired by the masters of Greek and Roman literature, so the sculptors of the Renaissance were indebted to the Greeks and Romans for their ideals, and the source of origin of many of their creations is not far to seek. The great art of the Renaissance, however, was not the copy of the art of the ancients, but the result of its inspiration. Just as the Renaissance *littérateur* satisfied himself with rhetoric and well-rounded and polished sentences instead of the clear and limpid words of the classic, so the metalworker viewed his imagination through decorative spectacles and mysteries, and from that time onward the greatest artists have been those who have felt most strongly this fascination, and have become the poets of death rather than of majesty in human shape. In the north, however, the dramatic passion, the sublimity of the imagination, the energy and earnestness of purpose and truer sincerity of religion, together raised the ideal from what had been the result of well-polished scholarship—this in itself was the subtle influence of the vigour and robustness of the long Gothic period. Tracing the influence which has inspired later times, the author came to that period in France when the kings dreamt of glory and expansion, and the love of France became manifest in the worship of its kings. Examples of this courtly impulse were afforded by the screens round the forecourt of the palace of Stanislaus at Nancy, and Adam and Girardon's Fountain of Neptune at Versailles. From the worship and adoration of patriotism in the person of their kings it was a small stride in the days of freedom and democracy to deify the republic, its progress and triumph, both in the abstract, as in the masterpieces of Dalou, and in the personages of her most distinguished sons. As illustrations the author cited the gates to the Apollo Gallery in the Louvre, the statues of Delacroix, Danton, and La Fontaine. Under all great art of the metalworker, whether the thing to be done is great or small, there must always be the same working of the intellect, the same poetic feeling for the ideal in story, the same tenderness for material. As for the future, let us not hastily condemn any struggle for new treatment. The achievements of the past are to be learnt from, not slavishly copied. To revive art, scholarship and intellectual training are necessary. It is not debasing art to sell it. What the artist requires is not too arbitrary an assertion on the part of the architect of what is good or bad, for which often an architect, owing to present-day methods of training, is not too well qualified to judge, but a stimulus to thought and energy for the artist—that the architect may gather round him a band of men

Digitized by Google

working eagerly in close co-operation with him for the glorification of his buildings and an enhancement of his fame.

Mr. GEO. HUBBARD proposed a vote of thanks to the authors of the three papers.

Mr. HARRISON TOWNSEND seconded the motion, which was carried unanimously, and the meeting terminated.

"SUBJECT AND TREATMENT."

IN the last of his four addresses on painting, "The Relative Importance of Subject and Treatment," delivered at the Royal Academy, Mr. Clausen, according to the *Morning Post*, laid stress on the importance of perfect accord in a picture between subject and treatment. Such accord was rare except in the greatest works, and in nearly all pictures there were evidences that the artist had leant too much towards one side or the other. The ideal was a controlling impulse affecting both, but the painting—the presentation—was of the first importance, as a picture lived through its technical qualities. For example, in the case of the "Christ in the House of Martha," by Velasquez, in the National Gallery, the real interest lies in the fine painting of the still life, and it was for that alone that the picture lived. Going back to the earlier masters, the Primitives, Mr. Clausen pointed out that their simple-mindedness was the secret of their charm. A young child looked on things much in the way they did, and he compared on the screen a coloured copy of a print made by a child with a picture by Fra Angelico. The Japanese artists, too, saw nature from a standpoint somewhat similar to that of the child, with of course a great difference of accomplishment.

After a passing reference to Ucello's "Battle of Sant' Egidio" in the National Gallery, in which the lecturer said the colour helped to suggest the excitement of the subject, he pointed out the want of accord in Bellini's "Landscape, with the Death of St. Peter, Martyr," because the landscape and the minor figures were painted so well that they detracted from the interest of the principal group. In the same spirit as that of the early men Rossetti conceived and executed his "Annunciation," which, like all his work, was an example of true accord between treatment and subject. The Rossetti was compared with Crivelli's "Annunciation" in the National Gallery, in which the accord was described as lacking. The Crivelli showed fine workmanship, but it was fantastic and wanting in repose. Sometimes, said Mr. Clausen, we heard an artist say that nothing came between him and nature, but that, of course, was impossible, as he was influenced by all the pictures he had seen. Reynolds was quite right when he said that the best road to originality was seeing what had been done by those who went before. However, just now too many pictures were painted under the influence of the later work of Velasquez. They had not the just tones and drawing of the master, and so, after a brief period of surprise at their facility, we ceased to admire them. But there was no facility in the earlier work of Velasquez himself, and there was probably no student who worked more laboriously than he. Speaking of the famous "Venus and Cupid," Mr. Clausen said that there, too, was a want of accord between subject and treatment. Velasquez was not at home in imaginative work, and the Venus was merely a model splendidly painted, and in no way a goddess.

In all imaginative work, continued the lecturer, some departure from realism and some ideal in the artist's mind were necessary. In Botticelli's "Birth of Venus" we did not feel that the figures were models or even mortals at all; they impressed us as being creatures of the artist's fancy. All Botticelli's work had that quality, and the details he introduced enhanced the interest of his pictures instead of detracting from them, as in the case of Crivelli. As an example of perfect accord in every way, Giorgione's "Fête Champêtre" in the Louvre was cited. At the head of the imaginative painters we might place Rembrandt, who painted what he had really imagined in his mind, and after him—at an interval—Watteau, whose pictures gave one an impression of reality in an unreal world. Watteau was always in accord in his treatment and subject. For unimaginative work, showing perfect accord between subject and treatment, Mr. Clausen instanced the pictures of nearly all the Dutch school, of Velasquez, Moroni and perhaps Veronese. Among the Dutch were Ver Meer of Delft and Peter de Hooghe. As there was no fine example of Ver Meer in the National Gallery he would illustrate on the screen one of the Windsor pictures by that master —"The Music Lesson." The representation in that picture was carried to the extreme point in every detail, but it was so just and true that the execution looked broad and easy. They might contrast it with the dexterous touch and "smartness" of Teniers, of which we were always too conscious. The method of Ver Meer was probably a thick under-painting nearly right in tone and colour, and finished by thin paintings. In Peter de Hooghe there was the same apparent ease of execution that distinguished the work of Ver Meer and the same rightness of illumination. There was always a strong dark in the pictures of De Hooghe, whose scale of colour ranged from rich black nearly to white. With Ver Meer and De Hooghe might be classed Steen, Metzu and Terburg, and of these three Steen was perhaps the greatest. In the work of all of them the only impulse seemed to have been to try to record something that looked beautiful. There was no story. After tributes to the art of Frank Hals and Watts, and a reference to Diderot's conversation with Chardin on the difficulties the painter had to face, Mr. Clausen said he must finish with a little personal confession. In his lectures he had bandied about the names of great men as if he had the right to express an opinion on their work. But he had felt all the time that it was presumptuous on his part to criticise even the least of them.

ROYAL COLLEGE OF SCIENCE.

THE President of the Board of Education has appointed Professor W. W. Watts, M.A., F.R.S., of Birmingham University, to the professorship of geology at the Royal College of Science, South Kensington, vacant by the retirement of Professor Judd. In view of the changes in organisation that may be found desirable in the Royal College of Science and the Royal School of Mines after the consideration of the report of the departmental committee on the College, it has been thought best to make this appointment a temporary one. Professor Watts was a Fellow of Sidney-Sussex College, Cambridge, from 1888 to 1894, and a member of the Geological Survey from 1891 to 1897. He has acted successively as deputy professor of geology at Leeds, Birmingham and Oxford. At the present time he is assistant professor of geology and professor of geography at the Birmingham University, and is secretary of the Geological Society.

THE SOCIETY OF ARCHITECTS.

IN reply to Mr. Belcher's general appeal to the profession for donations towards defraying the expenses of the seventh International Congress of Architects, to be held this year in London, the Society of Architects have handed to Mr. Belcher a cheque for 100*l.* for that purpose, and has also appointed twelve delegates to represent the Society at the Congress.

With a view of improving the competitions open to students of the Society of Architects and of forwarding the cause of architectural education generally, the Council have adopted the following recommendations of the committee appointed to report upon these subjects :—

1. That the Society's silver medal and a travelling studentship of 25*l.* be offered annually for competition among the students of the Society under such conditions as may from time to time be announced.

2. That an open scholarship of 10*l.* per annum, tenable for three years at any architectural school or college, or to be used in furtherance of the holder's architectural education in some other manner approved by the Council, be offered for competition annually under such conditions as may from time to time be announced. The maximum age limit to be nineteen and the holder to be required to register as a student of the Society.

It will be noted that competition for the travelling studentship will be confined to those on the register of students of the Society, but that the scholarship is an open one and is intended to assist those who are just commencing the study of architecture with a view of adopting it as a profession.

The regulations and conditions will be published in due course, and in the meantime those who propose to compete for the travelling studentship would do well to apply for admission to the register of students without delay, so as to qualify for entry immediately the conditions are issued. Particulars may be obtained at the offices of the Society, Staple Inn Buildings, Holborn, W.C.

NOTES AND COMMENTS.

A VERY remarkable case, by which the necessity of a final certificate by an engineer was upheld, has been decided by Mr. Justice WALTON in the King's Bench Division. The action came before his Lordship in Manchester. The plaintiff, Mr. ABRAM KELLETT, sought to recover from the Corporation of Stockport 12,155*l.* for work and materials in connection with a reservoir at Hayfield, Derbyshire. He entered into a contract to perform the work at schedule prices, payment to be made on the certificates of the engineer, Mr. JAMES MANSERGH. Plaintiff stated that under Mr. MANSERGH's instructions, which were given verbally, he carried out additional work, and for which he was to be paid at different rates to those in the schedule. On Mr. JAMES MANSERGH's death, his son, Mr. E. MANSERGH, was appointed to the office of engineer, and plaintiff alleged that the Corporation were aware of his being adverse to the claim. There was nothing due to Mr. KELLETT on the original contract, and the new engineer said there might be something due in equity for extras, and promised if it were left to him to treat the plaintiff fairly. Mr. KELLETT wished that the case should come before an arbitrator, but Mr. MANSERGH considered that it was one for his decision as engineer. Mr. Justice WALTON decided that a verbal agreement could not be substituted for the written contract. On Tuesday his Lordship further decided that payment was not to be made until the engineer's certificate had been given. As it had not been given there must be judgment for the Corporation. A stay of execution was, however, granted pending an appeal. It is easy to understand how such a difficulty could arise. Mr. MANSERGH's word was considered to be as good as a bond, and it was not anticipated that he would pass away so quickly. But what was possible for him in recommending payment was not so easy for his successor. An order in writing became necessary, and without it it was difficult to settle on prices and to grant a certificate.

THE annual general meeting of the Royal Society of Antiquaries of Ireland will be held in Dublin on Tuesday next. The annual report states that there is a falling off in the membership. The number on the roll for 1904 was 1,255, at the end of 1905 the number was 1,232. But there was about 100*l.* increase in the fees and subscriptions. In the last annual report of the Council a reference was made to the laws in force for the preservation of ancient monuments, and the action of the Estates Commissioners with reference thereto under the operations of the Irish Land Act, 1903. That body continues to deal with the question in a sympathetic manner, and frequently applies to officers of the Society for information as to the desirability of vesting such structures of antiquarian interest as are situate on estates about to be sold to tenants. Already steps have been taken by the Estates Commissioners for vesting three structures, two in the Board of Works, viz. the Augustinian Abbey at Callan, co. Kilkenny, and Ballyboggan Abbey, co. Meath, and one in the County Council for Kildare. The summer meeting and excursion will probably be held in Killarney.

THE Corporation of Edinburgh are desirous to erect new markets and slaughter-house, and last week the question of plans arose. Some members were of opinion that, although elaborate buildings and ornate details were not required, the proposed scheme was so large it would be wiser to have a competition in which architects from all parts of the country could take part. There were several interests to be considered, and what was desirable was to find somebody who could grasp the requirements of all of them. It appears that already money has been spent in preliminary inquiries and sketches. At the meeting the town clerk read a memorial by the Council of the Architectural Association in favour of the principle of competitive plans for important public buildings. This, it was argued, was the more progressive system which had been adopted by many municipalities. The Lord Provost, however, was opposed to competition. He considered that plans could be prepared by Corporation officers, and then they could, if so minded, send a deputation of their architectural members, and perhaps some of the butchers, to see some of the best markets and slaughter-houses in England. That would be cheaper than giving 5 per cent. to an architect on the whole works. On a division twenty-three members sided with the Lord Provost. If the Corporation would send a deputation to examine similar buildings in continental towns they would learn that architects were consulted because it was known that planning was an essential part of their business.

"THE Architect's Directory and Specification Index, published by Mr. W. T. COMSTOCK, of New York, should be useful outside the United States and Canada. It is the seventh annual edition, and much care has evidently been exercised in its compilation. The names of the principal officers of the building department in various cities are also given, and there is a specification index of manufacturers and dealers. The facilities for education are also described. American manufacturers are not unknown in England, and the architects in Canada as well as in the States might display occasionally a little reciprocity by ordering British specialties. If England and America are to be the leaders of the human race it would be well to show that in matters relating to building there is a common desire that English goods should be valued as they deserve in American cities. Who knows but Mr. COMSTOCK's Directory may be a help towards that desirable end?

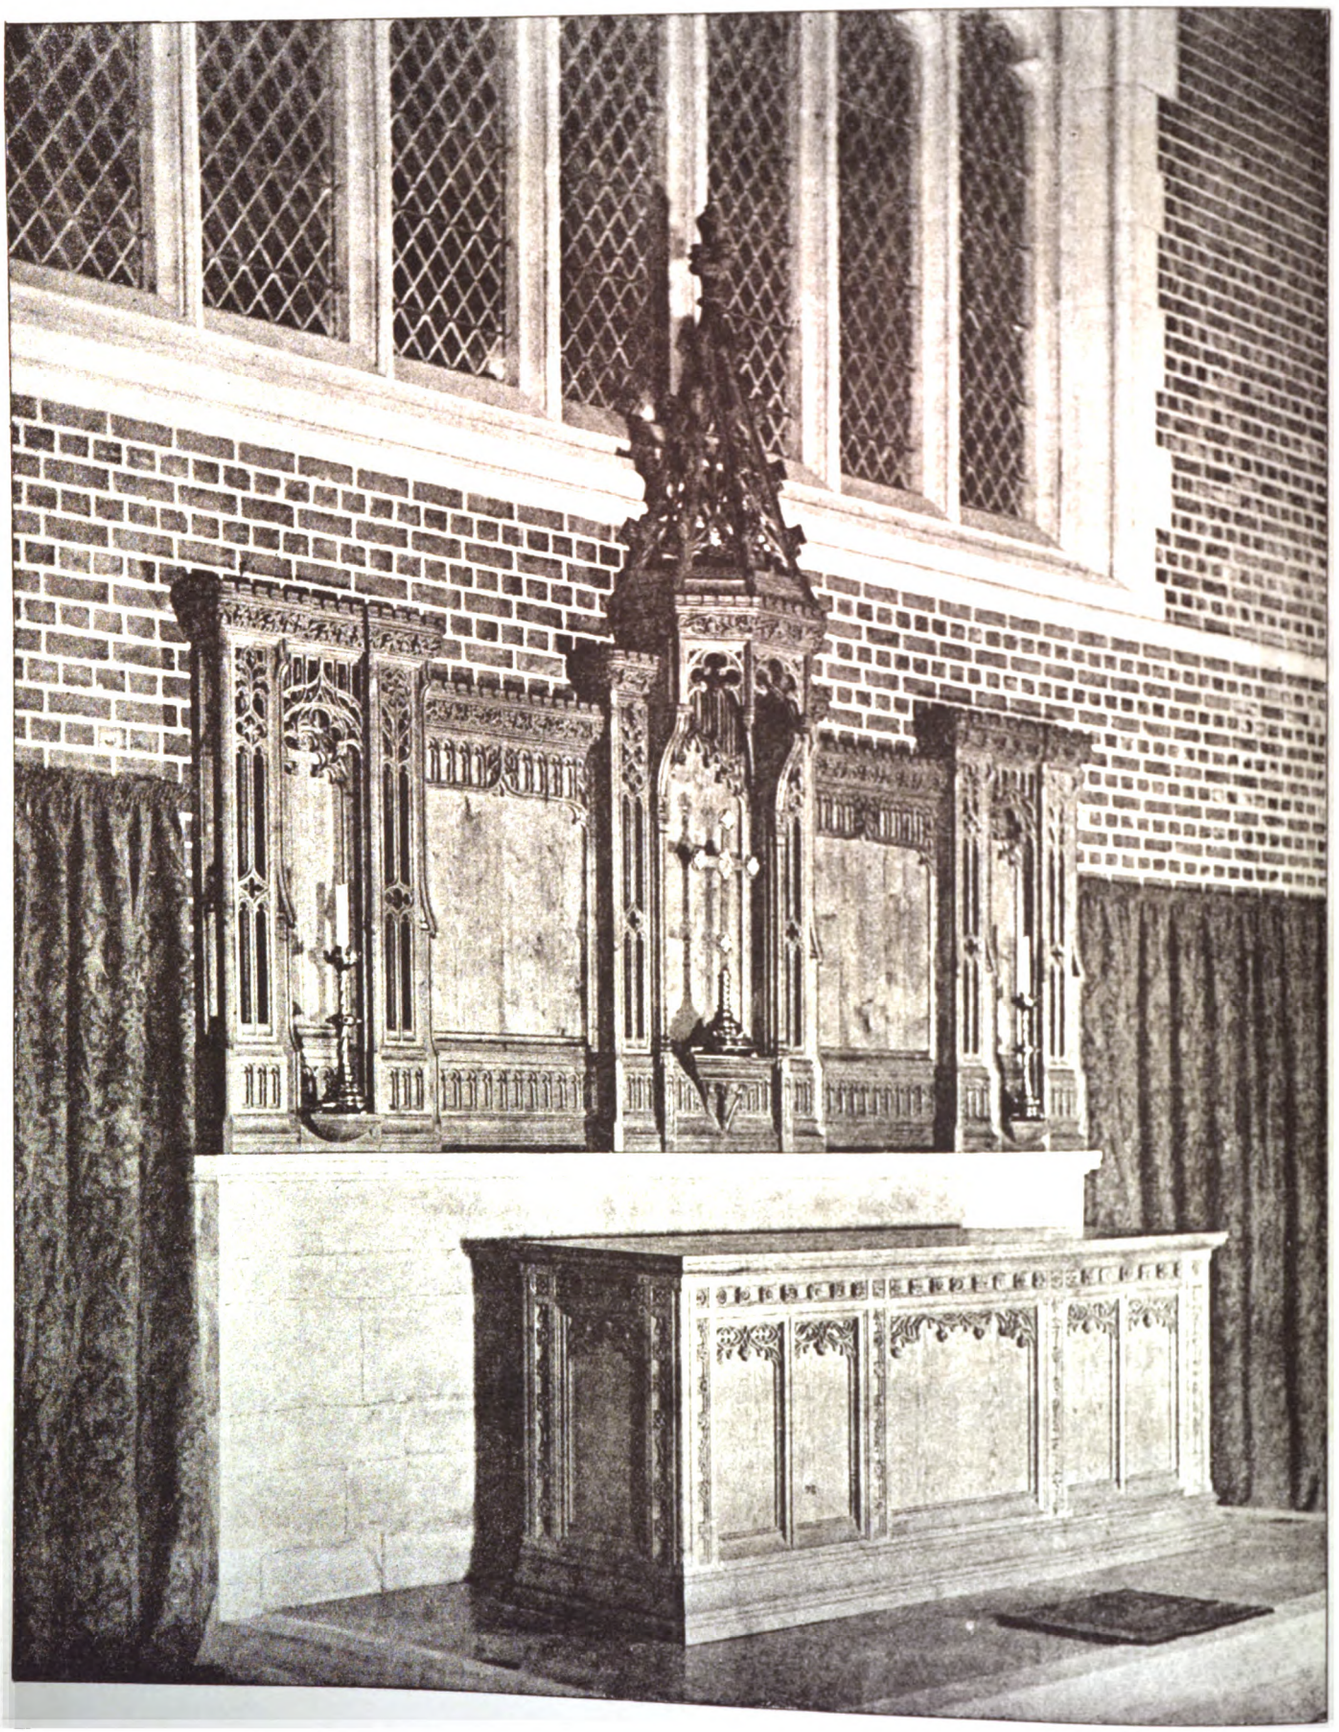
ILLUSTRATIONS.

MINLEY MANOR, FARNBOROUGH, HANTS.

THE Essay Prize of the Royal Institute of British Architects was awarded this year for one on the late GEORGE DEVEY. He was an architect who to a large extent kept aloof from his fellows, and in consequence his name was less frequently mentioned than those of men who did not possess his artistic power, but who had gained and exercised their knowledge of the world. The buildings he loved most were French châteaux, which were suggestive of a relationship to Gothic buildings. We published some years ago views of Minley Manor. But there is such a variety of composition it can be illustrated from a great many points of view with advantage.

DESIGN FOR MITCHELL LIBRARY, GLASGOW.

THIS design, by Mr. H. K. BROMHEAD, was estimated to cost less than the accepted or premiated ones. It is said that it was set aside, with a number of others, on the curious statement that they could not be enlarged at the back if at any future time that was required.



DEPTFORD TOWN HALL.—COUNCIL CHAMBER.

FITTINGS, ST. PETER'S CHURCH, HORNSEY.

THE eastern portion of this church was consecrated by the Bishop of LONDON last July. The plain panels in the holy table and reredos are intended for painted decoration. The screen occupies the arch between the organ chamber and south aisle. The work has been carried out from the details of Mr. J. STANDEN ADKINS, by Mr. W. PARMENTER, of Braintree, the contractor for the general work. The figures of angels on the screen were carved by Mr. N. HITCH, of Vauxhall.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at the premises in Tufton Street, Westminster, Mr. Louis Ambler, vice-president, in the chair.

The following gentlemen were elected as members:—Messrs. G. W. Home, R. Griffin, R. Mountford Piggott, E. P. Cooper, C. H. Rose and E. J. Cartaar. Mr. A. Dickin was reinstated a member.

Mr. F. LYNN JENKINS read a paper entitled

The Consideration of Sculpture by Architects.

When, some months since, I received from the Architectural Association Council an invitation to read a paper to the Association, I at first experienced some difficulty in finding a new and interesting subject. It happened, however, that early last year, as no doubt some of you will remember, a very interesting and lively discussion took place at one of the meetings of the Art Workers' Guild on the subject I have chosen, and I thought I could not do better than select this, and by enlarging on the paper I read then endeavour to use it to the best of my ability. I am not sure that the title is altogether clear in its meaning. Perhaps "How Architects Consider or Deal with Sculpture" would better express the intention I have in my mind.

From the earliest times the master builder, he who conceived the design of a structure to be built, consciously or unconsciously felt that the bare constructive details which utility demanded in the edifice did not wholly satisfy him. The desire innate in man for some peculiar or personal significance in his house led him to carve on the doorpost or some similar coign of vantage a sign symbolic of his name, his craft, his character, or his position. Later, these hieroglyphics became more pretentious, and as civilisation advanced and the cult of hero-worship grew in force man began to memorialise his dead and to build sarcophagi, on which he sculptured a history of the deeds and virtues of the departed. Religion also brought its necessities of altars and temples, and its presentments of the deity worshipped. In studying the history of the earliest ages of civilised mankind we seldom, if ever, find the art of sculpture employed without a direct and useful purpose, the isolated statue, unless it portrayed a hero or an idol to be worshipped, being practically unknown, so that we may infer that sculptured figure or symbolic ornament, whether carved in wood or stone, marble or granite, or cast in metal, was designed and executed solely to convey an intention which could not be well expressed by any other means.

It was not until a later age, when cultured simplicity gave place to the luxury and extravagance of super-civilisation, when pompous vulgarity superseded refined taste, that man commenced to lavish ornament devoid of any real significance on his buildings. I do not propose to illustrate this fact by reference to individual works throughout the ages; I think it will be sufficiently obvious that the argument is proven by history that, whereas in the beginning sculpture was used solely for an end which rendered it a necessity, in later times it degenerated into being, broadly speaking, a means of ostentatious display of wealth and exuberant luxury, and ceased to be an integral part of the *raison d'être* of the building it adorned. In stating this I do not overlook the gradual development of the natural instinct to make the "house beautiful," nor do I aver that ornamentation may not be equally necessary in designing from the æsthetic point of view; the fact remains that a time came when the demands of beauty claimed equal, and afterwards greater, rank than those of pure utility, and that whereas in the latter case the artist was limited within set bounds, in the former the restrictions were less apparent, depending, as they did, on the individual taste of the designer.

Hence we may take the architecture of the Egyptians as one example of a period when sculpture was used solely because it was the only means the builder had of expressing his full intention, and, on the other hand, that of the Greeks as illustrative of the perfect, restrained and refined consummation of the aims of the utilitarian as well as the lover of beauty and style.

There was another difference noticeable from the moment when the cult of beauty entered largely into the consideration of the architect, for whereas in the structures of the earlier designers that elusive quality we call "style" was shown in a very marked degree, it was the unconscious emanation of the character of each particular age and people, while the Greeks, with their newer ideals, aimed at and actually achieved the creation of not one but several complete conventional orders of architecture, each replete with style, each with its corresponding detail of ornamentation, each in harmony with the requirements of its time, both æsthetic and practical, finer than which nothing has since been attained to. The architecture of that age without doubt most nearly approached human perfection in its rich simplicity, won by the wedding together of the highest ideals of beauty and practical utility.

From that culminating point onwards in the history of architecture and sculpture the downward grade began, in some measure because of the very perfection of these ideals materialised for man's emulation. After every exposition of genius there is always reaction, always a host of imitators who strive to reach the same or even a higher goal of perfection without ever probing for the great secret which underlies the perfect success, and which is the mainspring of the achievement. Seizing on whatever superficial characteristic marks the work of genius from others, they endow this apparent difference with miraculous virtue, and, imagining that therein lies the straight road to the desired end, seize on this peculiarity, enlarging on it and carrying it beyond all bounds of restraint in their illogical efforts. It has ever been thus in the history of art, whether sculpture, painting, architecture, literature or music. So, because the Greeks introduced a new note into their wonderful architecture by the use of sculptured decorative ornament conceived in the finest spirit of logical practicability, introduced not merely for the sake of utility, but because they achieved the grand secret of making utility and beauty coincide, in the ages that followed men strove to emulate their genius by attaching undue importance to this one note in the perfect chord of Greek art, and played that note loudly, with many octaves, remorselessly endeavouring to make it the dominant of other chords in lower keys. Sculpture and ornament were applied lavishly with no logical reason as regards utility of purpose, with no cultured simplicity of style, and with little or no individuality or fitness. It is true that the Renaissance for a time stimulated a noble order of things, that while it lasted a glimpse of the vital secret of the Greeks enabled the artists of that period to attain to a high standard of beauty in which we find purity of motive, marked individuality and yet another fresh characteristic. For while the Greeks achieved an almost godlike perfection, it was a Pagan, superhumanly cold perfection, while the artists of the Renaissance, though attaining to a lower standard of success, infused a larger proportion of human nature into their productions, a sympathy with mankind born of the warmer culture of a romantic and passionate people. For this reason when the inevitable reaction again occurred the art did not sink so low, because men were striving with ideals they better understood, in which the human element responded and beckoned them on.

Another factor had also risen in Western Europe, which reached its richest, if not its purest, expression coincidently with the Renaissance. I refer to the Gothic movement, that great style in which Christian men found outward expression for the religious fervour which possessed their souls, and which at its best conformed to the same ideals as the architecture of the Greeks. For my argument, however, I introduce it merely because of the influence it had on the work of the Renaissance, for there can be little doubt that a greater proportion of the human element instilled into the Renaissance architecture owed its origin to Gothic influence.

Since the date of the Renaissance there have been many notable architectural achievements, particularly in France and this country, periods when sculpture has played a logical and consistent rôle in conformity with the architecture it embellishes. Still there has been no great movement to mark an epoch, and until the last few years no effort has apparently been made to evolve a style bearing the vital expression of its own time.

I have the profoundest admiration for the sublime performances of the great masters of Greek and Roman architecture, for their genius and culture. I do not argue that another Doric, Ionic or similar order may be lightly evolved, but, nevertheless, I strongly feel that, insomuch as they were the creations of minds trained to perfection in practicability, beauty of line, proportion, mass and silhouette, and, above all, in exquisite detail, there is no reason why the architect of to-day should not from his own inner consciousness, his culture and set aim produce buildings inspired by the requirements of his own day which would at least be thorough throughout, with individuality and characteristic style in the smallest detail.

Digitized by Google

When we remember that it is a simple matter for any architectural student to determine the style and date of a Mediæval Gothic building merely from a glance at the ornament on it, it seems an anomaly that to-day, when a new style consistent with the spirit of our time is being surely, if slowly, evolved by some of our ablest architects, a style marked by strong individual characteristics in general, there has been little or no attempt at the evolution of a fresh and fitting style of ornament to embellish such buildings, and we find twentieth-century architecture ornamented with a parboiled *réchauffé* of classical Renaissance or Jacobean detail. I have often thought that one of the chief reasons why the sculpture and ornament of the Greeks and Romans, of the Renaissance and of the Gothic buildings were so perfectly in accord with the architecture was because the architects were the sculptors and the sculptors the architects. Nowadays, unfortunately, we are specialists, and, as a rule, the architect knows little of the practical side of sculpture and the sculptor even less still of that of architecture.

This is, however, an age when there are many thoughtful, enthusiastic and inventive sculptors who would gladly assist in the development of a characteristic and personal style of ornament if architects could but express what they themselves really wanted. So long as ornament is handed over to business firms of architectural carvers, with their private museums of stock casts as their sole inspiration, not to get new ideas from, but from which to select and arrange, just so long will the neglect of this important part of the detail of many an otherwise good building appear to the historian of our time to have been unwarrantable and inexplicable in architects showing otherwise so much individuality, forethought and enthusiasm.

The over-familiar "egg-and-tongue," "bead-and-reel," and similar detail are perfect when properly applied; still, it must surely be possible to devise new ornamental members having all the degrees of light and shade which they possess, and yet with a more personal *motif* suitable to the modern building.

Some sculptors have felt the want of individuality in carved detail so much that they have for their special requirements evolved their own ornament. Amongst these Alfred Gilbert, R.A., and George Frampton, R.A., are notable instances. But while such ornament as modern sculptors have produced may be excellent in its conjunction with the rest of the sculptor's design, it was frankly for the personal requirements of the artists, and I mention it but to show that architects have not sufficiently exploited the latent ability of their brother artists the sculptors to strike with them that complete chord of harmony and refinement which is comparatively rare in the details of the architecture of the present day.

One of the most notable features of the wonderful perfection of the Greek masterpieces, a fact that must have forced itself upon all who have closely studied them, is that it would not be possible to omit any minute part of the sculptured or ornamental detail without marring the perfection of the whole, and, *vice versâ*, nothing could be added without procuring a similar result.

There can be no doubt that the Greeks considered the close study of the human figure above all else, making not merely drawings or models from life, but analysing the reasons which make it the most perfect design on earth, embuing themselves with the essential theory of its wonderfully constructed form rather than examining the anatomical structure. Hence they attained a thorough knowledge of the laws which govern the making of a practical and exquisitely beautiful creation by means of critical and analytical observation of nature in its most ideal forms.

Goethe wrote:—"So much is certain; the old artists had as complete a knowledge of nature and as definite an idea of what can be represented and how it must be represented as Homer had. These great works of art were at the same time supreme works of nature, produced by men according to just and natural laws. All that is arbitrary or fantastic falls away; here is necessity; here is God." And, again:—"If the artist, by imitating nature, by striving to find a universal expression for it, by exact and profound study of the objects themselves, finally attains to an exact and ever exacter knowledge of the qualities of things and the mode of their existence, so that he surveys the whole series of forms and can range together and imitate the various characteristic shapes, then what he achieves, if he achieves his utmost, and what, if achieved, sets his work on a level with the highest efforts of man, is style."

It was this gigantic understanding of nature which endowed their great sculpture with a God-like impersonal ideality, and which when brought to bear on their architectural undertakings rendered them equally perfect in their sublime beauty and practicability.

I believe they regarded the human figure in its most ideal form as the type governing all rules of design. They realised to the fullest extent that it could in no possible way be improved by alteration, either by addition or subtraction; they knew by heart its subtle constructive values; they studied the disposition of its details as opposed to its broad, simple masses; they understood the exquisite beauty of its proportions and its unapproachable harmony of line and silhouette viewed from any aspect; they felt the value of its wonderful variety of planes, its "local colour," and, above all, its marvellous unity and simplicity; and, with this set ideal well rooted in their minds, they strove and succeeded with consummate skill in blending these conditions into their masterpieces of architecture. I fully appreciate that modern conditions are altogether different, that the curriculum of study of an architectural student of to-day must of necessity cover a wider ground than of old, leaving little time for the practical study of the sister arts; but I feel sure that if students were given opportunities to draw and model from life to a much greater extent than they do, and were logically trained to regard this particular study as a means to a definite end in somewhat the same manner as the Greeks must have, then we should soon find an appreciable advance made towards the higher ideals of artistic architecture.

Students in architecture spend considerable time wading through a long course of study of the "orders," a course corresponding to the drawing and modelling by painting and sculpture students from the antique. I am convinced that not one in a thousand painting or sculpture students has any real comprehensive appreciation of the nobility, style and ideal beauty of the wonderful masterpieces of Greek sculpture which they copy so laboriously, so blindly and so mechanically. Such appreciation and understanding only begins to come long after they have passed through their apprenticeship to the art they practise. I fancy that the same remarks apply to the study of the "orders" by architectural students. In the case of the architects, they have not even the same chance of understanding the masterpieces they are copying as the sculptor or painter, who model or draw from a complete or sufficiently complete work, while the architectural students spend many a wearisome hour endeavouring to learn by heart the proportions and details of one column, a piece of architrave and a portion of cornice, considered without relation to the whole design of which they form but a part. I doubt if 1 per cent. of the students who yearly make such exhaustive study of the "orders" ever take the trouble to make a complete scale drawing of the entire elevation of which the column, architrave and cornice are but details. How, then, can they possibly train themselves by such means to analyse and appreciate the great principles which guided the Greeks in designing these masterpieces?

And now in what follows, if it should appear that I am unduly critical in my remarks, I would beg you to allow me the privilege of speaking less as an individual than as a logician who would carry his point with all the wordy insistence at his command.

It would generally be supposed that of all men the architect should be best equipped to understand and appreciate the art of sculpture, for he is trained to consider masses, to judge form from its plans, elevations and sections, to realise the value of line and silhouette and proportion, and the contiguity of happily-disposed planes of light and shade. Yet, in spite of this, we continually hear of architects surprised at the effect of light and shadow caused by sculpture applied to their façades, even though designed to their own instructions and after their approval of the sculptor's scale models. Again, architects are apt to consider sculpture as an afterthought, to be added to the design if funds permit, or omitted if not. The average architect does not regard sculpture as an integral part of his conception from the very outset, the omission of which would inevitably mar the entire design, which would be equally impaired by any afterthought or addition. I have not studied architecture to any practical extent, but it seems to me that in conceiving his design for a building the architect to be successful must from the start have two definite ends in view—the planning of a practical scheme and the making, as far as lies in his power, of a beautiful shell to contain this scheme. If this is the case, then I cannot understand the attitude of so many architects of to-day in regard to the introduction

Digitized by Google

of sculpture. Either it must be deliberately accounted for as a concrete part of the design, or it must be dismissed for ever, and no matter what funds should later accrue to provide for sculpture, its inclusion is rendered impossible by reason of the already complete nature of the design. I have perhaps unduly insisted on this point, because I firmly believe that its mature consideration will do much to improve the existing condition of architectural sculpture.

There is also a tendency to be too closely bound by tradition in the application of sculpture or ornament to just those parts of a façade which have usually been so filled. Possibly custom has labelled as a general rule the most fitting parts to be decorated, but it does not necessarily follow that under new individual conditions they should still be the most appropriate. Another fault is common, namely, the over-lavish distribution of small frittering ornamental detail, which sometimes completely destroys the simple dignity of an otherwise good architectural design. It would have been far better in some cases if ornament had been altogether omitted, or at most massed at one or two essential points. Such buildings remind one of men whose bodies are tattooed all over with designs having no relation whatever to the form thus masked. One may admire the fine detail and workmanship of the tattooed design and yet heartily wish it were not there.

The proper use of sculptured relief has always been one of the most difficult problems both to architects and sculptors, and I fear that too little attention is often paid to the matter of projection in relief when applied to architecture. One sees buildings where, although satisfactory as regards scale, pattern and style, the reliefs do not seem to wholly enter into the spirit of the scheme, and it is not until one has carefully sought the reason of this that one arrives at the definite conclusion that the projection is the cause of the trouble. Either it is too high and the local colour is too marked or the case is reversed, with corresponding damage to the unity of the architect's conception. It must be borne in mind that there are two methods of obtaining strong values in relief. One is by having a high projection and making the sections rather round; the same effect can also be procured with much less actual projection by treating the planes very simply and making the edges sharp and square. It is therefore of importance for the architect to decide and instruct the sculptor as to which method he considers most appropriate to his design if he wishes to insure complete unity of feeling throughout.

I am not one of those who, dissatisfied with the conglomerate mixture of styles prevalent to-day, advocate entire rejection of all existing schools of architectural expression and a return to the primitive modes of thought and a bland, childlike innocence of aught but natural law. I do not believe that this deliberate intention to gain originality can result in anything but eccentricity, because it is not, as is pretended, the outcome of a natural train of thought, but in reality that of affectation. I see no reason to reject any of the useful store of knowledge to be gained by study of the finest examples of all ages. At the same time, I do firmly believe that one of the surest methods of creating a purer and more forcible expression of the individuality of our time will be found by the acquisition of such culture concurrently with a more complete familiarity with nature's own laws of beauty. This latter I contend to be the core of the whole matter.

A great deal has been written and there has been endless discussion on the subject of collaboration between architects and sculptors. For my own part, I fail to see how it is possible, under existing circumstances, for true collaboration to occur, and although in a few isolated instances a great measure of success has been attained, it has, I believe, been more the result of accident than otherwise. Before collaboration can be thorough there must be a common ground of mutual understanding between the sculptor and architect, which certainly does not exist at present. As I have said before, there are very few architects practised in the craft of the sculptor, and fewer sculptors are there who can by looking at plans, elevations and sections realise to any extent the entire conception in the architect's mind. How, then, under such haphazard conditions can the two minds hope to work to one accord? Is it any wonder that, for want of practical knowledge, the architect does not fully realise the intention of the sculptor's sketch models, or, on the other hand, that the sculptor is hampered by uncertainty as to whether he is really in sympathy with the architect's conception, and thereby prevented from working with the sincerity and directness of purpose which must inspire all true artistic endeavour? If by practical means some common ground of mutual understanding can be found and adopted, then I am convinced that true collaboration, necessary in an age when artists are specialists, will become an accomplished fact, and with its practical and successful working will cease the fruitless discussion which usually ensues when the word "collaboration" is mentioned.

I venture to lay before you what I consider may be the means of providing this "common ground of mutual understanding" whereon the architect and the sculptor may start to build their ideals in unison, each with perfect freedom of sympathetic action. I refer to the use of scale models of their buildings by architects. I am convinced that in all serious undertakings where sculpture is to be employed as a part of the architectural scheme success will in the end be more surely attained by the architect's careful consideration at an early stage of the designing of a scale model of his conception. In this model he should express his intention as to the general planes and masses, the proportionate depths and projections of mouldings and reveals, and he himself must decide by means of suggestive bits of clay exactly the disposition, pattern and projection, silhouette and mass of the parts he wishes the sculptor to enrich. Then, when he has finally brought the model to the point when it realises to the best of his power the full expression of his conception, he can safely call in the sculptor whom he feels most in sympathy with the particular style of the project in hand. I venture to say that the sculptor he selects, if he has any artistic imagination, will from the outset enter into the spirit of that undertaking with a mind attuned to the key of the architect's inspiration in such a manner as he never does at present. He will see shapes which he can understand, and which at once will inspire him with suggestions of beautiful detail which may be evolved therefrom. He will be in his natural element, an element in which plans, sections and elevations play but an imperfect part, and, best of all, he will be able to realise from the commencement the most fitting treatment of each particular detail in relation to the whole structure.

Herein, I contend, lies the chance of great success for both architect and sculptor—success for the sculptor because he will have a chance to do really decorative and monumental sculpture, and success for the architect for two reasons: firstly, because he will no longer be worried by uncertainty as to what his brother artist is going to give him or how the work will look when completed; and, secondly, because when he sees before him the model of his proposed building he will be less likely to be conventional, he will infuse more of his own individuality into the minutest detail, and there will be less likelihood that in an absent-minded way he will label every other member "egg-and-tongue," "bead-and-reel" and so forth. I also believe that the adoption of scale models such as I have described would exercise a great educational influence on both artists. The sculptor would gain by the practical consideration of architecture in a medium that he can understand and by a fuller realisation of the needs inspired by the conception of the architect, while, on the other hand, there would be a tendency for architecture to become simpler and more monumental, and the architect by means of his practical study of form giving broken light and shade would widen the already large field of his knowledge and gain fresh power.

I have often thought it would be an excellent idea if students in sculpture and in architecture were taught side by side in classes, where the decoration of architecture with sculpture should be the subject for special consideration. Architectural models should be made by the joint efforts of one sculptor and one architect, in the designing, modelling and decorating of which both students would become intimate with the principal laws governing each branch of the art.

Such training would, I believe, bear so rich a harvest of practical result that it would soon become a definite part of the curriculum in the education of architects and sculptors. I would like to see the experiment made by enthusiastic students under sympathetic and appreciative guidance.

There are several small sketch clubs where young practising artists, sculptors, painters and architects periodically meet together at each other's studios to practise drawing from the living model. The idea is an excellent one, serving as it does the twofold purposes of useful study and the creating of a bond of fellowship between the

Digitized by Google

votaries of each different craft. I am sure there are many young sculptors and architects of equal professional rank who would gladly welcome the formation of similar clubs where the particular study of decorative sculpture applied to architecture might be practically considered by means of sketch scale models. Such clubs or classes should for useful purposes be limited in membership; possibly two of each craft would be found to be sufficient. The procedure might be as follows:—Having at the outset mutually agreed upon a particular type of building giving fair scope for the joint study, the architects would evolve the plans and elevations sufficiently for the object in hand, explaining the scheme and their method of dealing with it for the benefit of the sculptors. Then, selecting such portions as would best serve the purpose, they would all proceed to the making of a clay or plaster model or models, and in this process the practical experience of the sculptors in handling plastic material should prove of value to the architects. I would, however, suggest, in order that the fullest benefit should accrue from the study, that the architects should be considered the controlling spirit of the design as regards the disposition, line, mass and projection of the sculpture or ornament on the façades under construction. The next step would be for the sculptors to evolve from the lumps of clay suggesting merely the desired values of broken light and shade sculpture or ornamental detail which should accentuate the intention of the architects, at the same time by choice of subject giving full expression to the *raison d'être* of the building. The study might with advantage to all be carried further by the enlargement of these details to a working scale, with practical reference to nature by the use of the living model, and, as every process would take place in the presence of all, it could but result in a better understanding of the bed-rock principles governing each other's art, elucidated by practical means in a sympathetic way throughout the joint undertaking. I believe that this form of study would do more for the advancement of art than any number of lectures to sculptors on architecture or to architects on sculpture.

Let there be a practical and sympathetic understanding of sculpture by architects, a closer and more analytical study of the laws of beauty and nature; let the individuality of our many clever architects have full play in the thorough consideration of the smallest detail; let sculpture be introduced on buildings only to serve a definite purpose, both æsthetic and practical fitness, and at once we shall see the logical result in the growth of a school of architecture embued with style inspired by the spirit of our own age.

Mr. STIRLING LEE, in proposing a vote of thanks to the author, said the paper was a practical one and full of suggestion. It started very thoroughly from the beginning of things, and they had been told that the idea of sculpture commenced when man desired to ornament his building. The results of this ornamentation had been traced through the ages until later times, when it was seen that the sculpture had almost ceased to be a part of the building it adorned. He thought that, speaking generally, it would be felt that much of the ornamentation of the present day lacked that earlier appropriateness. It was difficult, however, to say how far the sculptor was in fault, since he found it often hard to realise the architect's conception. The first point to grasp quite clearly in the collaboration of the architect and sculptor was what part of the scheme the sculpture had allotted to it. In earlier examples the old men aimed at some definite idea, and their work carried out that intention. That the sculpture when introduced should be part of the scheme architects would agree, and yet it was often noticeable that a building with ornamentation would be æsthetically far finer without it. Then there was need to avoid meretricious work, and, speaking from the sculptor's point of view, he said it was better to see a fine space of masonry than cheap ornament. It was important to notice how ornament had grown in the development of every style, for it was a mistake to believe that certain kinds of sculpture were in harmony with all styles of architecture. The ornamentation must necessarily be the outcome of the general scheme, and it was for such a purpose that collaboration in the two arts was needed. So long as academic principles were separated from the practical the architect and sculptor could not work together. The two must have the same vision, and the point could not be enforced too strongly. They must remember, he said, the clay model had limitations, and that stonework called for different treatment. Sculpture on buildings, therefore, was often the stone copy of a clay model. In conclusion he advised sculptors to work from drawings in architectural collaboration, and to consider their designs *in situ*.

Mr. H. H. STATHAM, who seconded the vote of thanks, referred to the remarks of Mr. Lee, because he thought that an interesting point had been made as to sculpture on buildings not being masonry sculpture, but a reproduction of clay modelling. How was the difficulty to be avoided? Would Mr. Lee like, supposing he had to carve a frieze on a building, to try the experiment of what Michel Angelo did, by going direct to the stone and cutting the sculpture without any previous modelling? A man would require to be certain of what he was going to do, and it might have the result of producing the masonry style of sculpture which Mr. Lee rightly wished to secure. In considering sculpture in relation to buildings it had to be remembered that there were two possible points of view, *i.e.* whether the sculpture was to appear as put in a frame or whether it was part of the building. They might have both. He should say that the sculptures in the Parthenon pediment were sculptures framed within the pediment, free from the building; but the frieze was sculpture forming part of the masonry. The two kinds of sculpture required to be treated differently. He could not be so optimistic as Mr. Jenkins about the new style. He (the speaker) did not see it himself, and he did not think we could ever expect to see a national style of architecture grow up as had been possible in the past. The reason was that we had so much before us, and the wider knowledge of earlier work brought to our minds by travel and photography, &c., produced sentiment that was more than national. Those facts could not be overlooked, and for that reason they could not evolve a new style. It was said in the paper that one of the surest methods of evolving a purer and more forcible expression of the individuality of our time would be found by the acquisition of culture concurrently with a more complete familiarity with nature's own laws of beauty. From that it was to be supposed that Mr. Jenkins knew what nature's own laws of beauty were. He himself did not know those laws, nor had he ever met anyone who did. Sculpture, perhaps, and architecture certainly, had not much to do with nature, which was at most only at the foundation of them. Referring to collaboration, he said when an architect wished to have sculpture on a building it was essential that at the outset he should have some idea of what he wanted the sculpture to do, for it was a poor method to leave certain places for ornament and then go to the sculptor. An architect should have some scheme in his mind as to what the sculpture should express, and in what part of the building it should be placed. The question of position was important, especially in view of the fact that sculpture and architecture seemed to have opposite demands. Architecturally, it was most effective to put the sculpture at the top of a building, as the Greeks did with the Parthenon frieze, which they regarded as an architectural band of ornament, for they put it where it could hardly be seen, and only by reflected light from below. But if sculpture was to be seen and understood intelligently, it must be near the base of the building. Those points had to be considered. Did they want an architectural ornament with some meaning in it when they looked closer at it, or something to be studied close at hand? The speaker agreed with Mr. Jenkins in what he said as to the enormous advantage of having scale models of buildings. The practice need not be followed in the case of small commissions, but where they had to do with important buildings, and more particularly where sculpture was to be combined with architecture, it was most desirable to produce a model in order to secure the best result ultimately.

Mr. H. STANNUS said he could not help feeling, in spite of what had been mentioned in the paper, that lectures had some little value on subjects of the kind they had been treated to by Mr. Jenkins. Although lectures had been condemned in the paper, and it was suggested that students would get on better without them, yet the fact that Mr. Jenkins had read an interesting paper was the happiest refutation to the suggestion. The speaker agreed there was great need for sympathy between architects and sculptors, though he believed the architects were prepared to collaborate with their brother artists. It seemed, however, as if the sculptor stood aloof, because looking at many of the monuments erected in London, it would be found that only in a few instances had the advice of the architect been sought. In France there was that collaboration, and the public monuments consequently were of a higher artistic

Digitized by Google

value than our own. He could not help thinking that the author of the paper had in reality been giving his opinion on the architecture of twenty or thirty years ago. The tone of the paper was a little pessimistic, but the speaker ventured to think the architecture of the present day would bear comparison with work that had preceded it, and, in fact, that it would take a very much higher stand than much of the architecture erected in the past.

Mr. H. T. HARE, in alluding to the question of collaboration between architect and sculptor, said it seemed to him that a great deal of the blame for the lack of sympathy rested more with the sculptor than with the architect. In England the two arts were divorced from each other, and sculpture had become more or less gallery or studio work. One had only to look round London to realise how the sculptured monuments failed in their architectural accessories, and the fault was with the sculptors themselves. He noticed in the paper a craving after a new style. He thought this was quite hopeless, and he did not think they wanted a new style. What they wanted was a development of the old styles; in fact, progress in their art ought not to be a question of style at all. Anything new as a rule was bad, and all the new fashions that had arisen were simply peculiar to a period, for they had all died out and were not remembered. The only architectural works of interesting value in London were the buildings which had been designed on traditional lines.

Mr. M. GARBUTT supported the vote of thanks, and after some remarks from the Chairman, Mr. JENKINS briefly replied, and the meeting terminated.

STONE DECAY IN GLASGOW.

IN a letter to the *Glasgow Herald* Mr. J. Wilson Dougal writes:—

Viewfield, Linlithgow: January 15, 1906.

Sir,—I observe that some recent correspondents, writing to your columns on stone decay, are still debating whether sulphuric acid is chief and sole offender in the decay of stone.

It is about fifteen months since an important and interesting article appeared in the *Herald*, giving particulars as to the ravages of sulphuric acid. In response to this article I ventured to point out that, while the action of sulphuric acid, either free or combined as sulphates, is undoubted, the decaying power of carbonic acid, though not so virulent, is more extensive in area because of its wider distribution in the atmosphere.

Sulphuric acid is more localised in the atmospheres of industrial centres and of large towns, where coal and coke are used as fuel; while carbonic acid exists in almost uniform proportion of .04 parts per cent. of the constituents of the atmosphere, equally over moorland or in crowded cities. In cities, we must remember that while sulphuric acid is issuing from every furnace and household fire, larger proportions of carbonic acid are at the same time let loose into the air, without taking into account, further, that every living creature exhales carbonic acid in each breath.

Carbonic acid is very soluble in rain water, and is thus conveyed into the stone, which retains moisture with strong capillary force. So we have sulphuric acid and carbonic acid jointly at work in town areas, while carbonic acid is largely predominant in country districts.

However, if these two acids are "les bête noires" of the builder, we must note that carbonic acid is a very necessary thing for success to the farmer—to disintegrate and dissolve out the precious elements in the stony detritus of the soil which are so necessary for his crops.

This fact shows the ubiquity of carbonic acid, and its action, though slow, is always going on where felspars and other rocks of alkaline character exist. It acts more quickly on the lime and iron bodies which bind the grains of sand in building stone. It is useless to contend that only one of these is to be blamed for stone decay.

My chief purpose in writing this letter to you is not to give the preceding recapitulation of these well-known actions, but, with your leave, to point out other causes of decay, perhaps less prominent, but still persistent and destructive; and as a reference has been made in your columns, in recent letters, to what are called "white powders" or efflorescences on walls we may show that there are several kinds of efflorescences. We find on brick made from clays adjacent to the sea, or ancient sea beds, salt efflorescences, which appear in dry weather and disappear into the brick in damp weather—these walls are usually damp and thus unhealthy, and encourage fungoidal growths. Sulphate of lime, another white powder, may be seen on stone walls, but it is not so damaging as sulphate of magnesia, which often shows like frost. Where it exists it is a very destructive agent, especially on sandstones. Many builders and architects are not aware of the fact that many cements contain magnesium sulphate. Masons speak of it as the "acid of the cement." The sulphate of magnesia in cement, though only in small percentages in these cements, is very soluble and is borne out from the cement, on which the stone is set, by the exuding water from the wet cement. It appears in a few days, especially in dry weather, as a frost or efflorescence for some inches all round the edge of the exposed stone face. Architects and builders seem to be unwitting as to the damage done, because these cements are largely used in building up the fronts of some of the largest and finest buildings. Thus, often a stone is blamed for the mischief which the sulphate of magnesia does, and resulting in handsomely carved stones showing pitted marks or smooth face of stones destroyed and initial decay begun in a few weeks after building, independently of the action of the usual atmospheric decaying agents. Another efflorescence is calcium nitrate, of a more complex formation, having a more limited range of action. This substance may recall to your readers the practice of the ancient "petremen," who used to hunt, in the garbage of houses, in olden times for this white powder, which was required for the manufacture of gunpowder.

Again, we have films, of different colours, of impure carbonate of lime on walls, or hanging as miniature stalactites, under decaying stone, where usually the wasting is going on very badly.

All builders know how fast some stones decay in towns or mansions built near sea atmospheres, in which is found salt that has been driven landward in fine spray by the wind.

As well as these material agents of destruction, we must not forget the minute forms of plant life, mosses, algae, lichens and bacteria which have their share in destroying stone. They find food in the lime and iron compounds in sandstone, also from ammonia, salts and other air constituents. Bacteria teem in millions on the stone-face, and, like the other forms of plant-life referred to, make use of that provision of nature—the power of exuding secretions, which dissolve the lime and iron binding material round the grains of sand. The mischief done by these may be infinitely small or great according to the nature of the stone.

None of these decaying actions on stone by the various agents mentioned can take place without the presence of water. Thus damp is the common factor of all these reactions, which go on in a ratio equivalent to the amount of moisture. Builders know that most decay takes place under projections of stone, balustrading, &c., where most moisture is retained, because it is not so wind swept, and therefore damper than the flatter surfaces of buildings. We must, of course, not overlook the physical causes of stone disintegration: thus, wind drives off loosened surface-grains, exposing new surfaces; expansion and contraction of buildings in hot and cold weather. More important is the action of frost and thaw, which expands with irresistible force the water contained in stone. In this way weak spots and seams in the stone are thoroughly searched, and specially the lines of stratification yield a quick return in decay.

In considering this question of decay we find great differences, due to the inherent strengths of stones, the original pressure at the time of the stone's formation, the character of the stone constituents, the binding material, whether silicious, lime, iron or magnesia compounds.

These remarks apply more to sandstones than to the dolomitic building stones, which are used more in England than in Scotland.

We hear sometimes of the importance of "seasoning" stone, and though it may seem a paradox the explanation is probably found in a reaction of one of the processes of decay already spoken of. As, however, I have taken up so much of your valuable space this matter must be deferred.

It may be generally stated that the quality of a stone, to withstand decay, depends on many things, but one point is sure, that, other things being equal (as strength of coherence of the stone particles, &c.), the more carbonate of lime or other binders than silica the stone contains the more readily will it decay in damp atmospheres in towns or country districts. Then, with all these forms of decay, are we to perplex the builder, who naturally asks how may it be

Digitized by Google

prevented? In answer to this, it may be said that elaborate and extensive tests were made a number of years ago, under the supervision of prominent builders and architects in various parts of Scotland, and it has been found that thoroughly successful results may be had. The special preparation used penetrates the stone and makes a waterproof stone skin, thus preventing the entrance of deleterious substances into the stone.

Since penning the above I have seen the letter on stone decay in your issue of Saturday, and beg to say that the aforementioned preparation is manufactured in Scotland, and has been advertised in your columns.

MODERN ART.

THE members of the Birkenhead Art Club held an open meeting on the 18th inst. under the presidency of Dr. Harrington, when Mr. George Hall Neale, president of the Liverpool Academy of Arts, read a paper on "Modern Art." According to the *Liverpool Courier* he said when they considered the part art took in everyday life it was strange how seldom it came prominently to the front in any community or gathering such as that. In the huge centre of active life on either side of the Mersey, where churches, hospitals, schools and all kinds of intellectual institutions abound, their active art life was principally expressed by a few concerts at the Philharmonic Hall and by the autumn exhibition of pictures at the Walker Art Gallery. If they took the average young man, it was the great exception to find one with any feeling whatever for any of the arts. "I would like," continued Mr. Neale, "to speak about art in its particular relation to this part of the country where we live. In spite of the indifference of the average young man and the want of interest generally, I am sure that things are improving and will continue to improve. If we take architecture, which is claimed by some to be the mother of the arts, every one will admit the vast improvements that have taken place in this neighbourhood in all classes of buildings. I will mention two examples of improvements which have taken place in the last few years. There are now few more picturesque streets to be found in the country than Dale Street, looking from the town hall towards the Royal Insurance buildings. On this side of the river you have the beautiful cottages of Port Sunlight, which only need the touch of Time's softening fingers to make them beautiful. These are isolated instances of what is taking place everywhere, and I believe it is the principal sign of the general growth of æsthetic culture. Speaking as one of the local artists, it is difficult to form an unprejudiced opinion and to say whether the art produced in our midst compares favourably with the work done by the Liverpool painters of the past. The conditions now are entirely different. In the flourishing days of the Liverpool Academy the local artists formed a real school of painting. They had their individual styles, but they were influenced by the same peculiar ideals, and all associated more or less with each other. As sincere and true artists they deserve all the respect in which they are now held. The Liverpool Academy represented painting in our midst. The exhibitions were brought together by the members, and in the selection and choice of the pictures hung the local artists formed the ideals that made them a distinct and individual body. At that time the men who are now known as the old Liverpool school were a long way ahead of the public. The courage with which they acted up to their convictions, and what they considered the right principles of art, lost for them, however, the support that the Liverpool Corporation gave, created a split in their own body, and their exhibitions came to an end. Most people think that the breakdown of the Liverpool Academy exhibitions was the most unfortunate and disastrous thing that could happen to the artists of Liverpool, as it educated and helped to make the local artists. The Academy was the natural expression of the art of the community, and when its exhibitions ceased in 1867 the conditions that had given birth to a distinct and individual school came to an end. With the commencement of the Corporation exhibitions the art of Liverpool became merged more or less in the art of the whole country. From the point of view of Liverpool itself it was the difference between furnishing and decorating your own house and getting a firm of London decorators to do it for you. The principal art event of the year in Liverpool is the autumn exhibition at the Walker Art Gallery, and now this, instead of being managed by the section of the community most interested, is organised by a committee of the Liverpool City Council. The Liverpool Academy still has a show of its own, but as an exhibition it is naturally quite overshadowed and in the background. The position of the Liverpool Academy and local art at the present time is perhaps most interesting to those who, like the members of this club, associate with the local professional artists. I am very diffident in giving my opinion on the subject. It is impossible, I suppose, to realise in its true proportions the work of the men and women whom we know personally, and in many cases intimately. Perhaps one may put it generally by saying that the changed conditions I have referred to have made the art here more or less typical of the art of the whole country. But, although the work of the local painters is merged in British art generally, and we all aim at individual distinction in the London exhibitions, still the works that are produced have certain peculiarities. The majority of the local artists are individuals, and each one works out his ideas of art in his own particular way. I will give as examples among the local painters such varied artists as David Woodlock, Robert Fowler, A. E. Brockbank, Hamilton Hay, Herbert M'Nair, J. Y. Dawbarn, Alison Martin and Miss M'Crossan, and there are many others whose names will occur to you. Taking the local painters as a body, it is impossible to avoid coming to the conclusion that there is no special tendency at present like there was in the old pre-Raphaelite days. If I were asked what particular artists have impressed their individuality upon the greatest number of other painters I should have no hesitation in saying 'John Finnie and David Woodlock,' and the reason, to my mind, is that in one case Mr. Finnie's works appeal to the most natural taste, and with Mr. Woodlock his wonderful sense of ideal beauty affects everyone who sees his pictures. If there has been any particular school associated with Liverpool in the immediate past it is the water-colour landscape school which Mr. Finnie has more than any other artist helped to found—the fresh vigorous landscape school, of which I may mention as some of the most prominent exponents, George Cockram, John M'Dougal, James T. Watts, Talbot Kelly, H. Swanwick and Isaac Cooke. It is not easy, however, to distinguish between all the local painters and to label their particular styles, and there are many that might be classed in various other schools. At the present time there may be signs of a leaning towards naturalism, particularly among the portrait-painters and in the oil-landscape work of artists like Thomas Huson and Herbert Boyle, but this is difficult ground for a local painter, and I will not attempt to define the tendencies that affect the portrait-painters. When I say that we belong to the realistic school I mean that, although the influence of Whistler is felt by some of our body, so far as I can judge there are few signs of that kind of treatment that we associate with the names of Aman Jean and Greiffenhagen."

HISTORICAL BUILDINGS IN SCOTLAND.

AT the Edinburgh Architectural Association meeting last week, Mr. H. O. Tarbolton, president, in the chair, Mr. W. T. Oldrieve, principal architect for Scotland of H.M. Office of Works, read a paper entitled "What H.M. Office of Works is doing for historical buildings in Scotland." There was a large attendance.

Mr. Oldrieve said the object of the paper was to let the architectural profession and the public know what was being done with reference to those national historical buildings of which the Government department which he represented had the charge. It was, he ventured to think, neither right nor wise on the part of a public official to avoid reasonable public inquiry into work carried on for the general good. Only those buildings would be referred to which had a national and architectural character. Such buildings might well be considered as national architectural treasures for which a Government should be held responsible, such responsibility being that of a trust which ought not to be avoided or abused. It appeared as though there were a general awakening in all civilised countries to this national responsibility, and within the last few days he had observed that one of the subjects for discussion at the National Congress of Architects to be held in London next July was that of the responsibilities of a Government in the conservation of national monuments. All architects and antiquarians must be pleased to see a growing interest on the part of the general public in this question, for only the enlightenment and improved

Digitized by Google

artistic sense of the public could enable any Government to take efficient control and enforce the necessary provisions for the conservation of such buildings. Much had been done by legislative action in other European countries for the care of ancient monuments. Almost every European country except their own was taking action in the preparation of official catalogues of national monuments, and surely every possible means should be used to take similar action in this country. Scotland was rich in historic remains of architectural monuments of the past, but the greater number of these were under no official cognisance and subject to no official control. It appeared to him that the work of the National Art Survey of Scotland deserved special notice and recognition in this connection, and he could not imagine a more praiseworthy scheme than that of encouraging architectural students, under proper guidance, to systematically measure and sketch the more important architectural remains. If these were tabulated and published in due course they would be of universal value for reference when the official inventory was compiled. The historic buildings and remains over which their department had direct control might be classified under two heads:—(1) Buildings vested in the department; and (2) architectural and antiquarian remains, of which the Commissioners of Works were custodians under the Ancient Monuments Acts. It was now, however, recognised that other Government departments which carried out building works referred to the Commissioners of His Majesty's Works cases which affected ancient buildings of an architectural character, as, for instance, the War Department with reference to Edinburgh Castle, Stirling Castle, &c., and the Admiralty Department, as in the case of Rosyth Castle, a proposed restoration of which was contemplated.

The archæological remains of a minor character, so-called ancient monuments in Scotland, of which they were custodians, comprised:—The circular walled structures called Edin's Hall, on Cockburn Law, Berwickshire; the British forts on the hills called the Black and White Catherthuns, Forfarshire; the Pictish towers at Glenelg, Inverness-shire; the Stones of Callernish, Lewis; the Brough of Clickimin, Shetland; the Pictish tower at Mousa, in Shetland; the inscribed slab standing on the road leading from Wigtown to Whithorn; two stones with incised crosses on a mound in a field at Laggangairn; and the pillars at Kirkmadrine, Wigtownshire. Secondly, there were ancient monuments to which the Ancient Monuments Protection Act, 1882, applied, but which had not yet been taken in charge by His Majesty's Office of Works. These included the Bass of Inverury, the vitrified fort on the Hill of Noath, and the pillar and stone at Newton-in-the-Garnoch, Aberdeenshire; the British walled settlement enclosing huts at Harefaulds, in Lauderdale; the Dun of Dornadilla; the sculptured stone called Suenos Stone, near Forres; the cross slab with inscription in the churchyard at St. Vigeans; a group of remains and pillars on a haugh at Clava, on the banks of the Nairn, Inverness-shire; the cairns, with chambers and galleries partially dilapidated, Minnigaff, Kirkcudbrightshire; the Catstane, and inscribed pillar, Kirkliston; the Ring of Brogar and other stone pillars at Stennis, Orkney; the Chambered Mound of Maeshowe, Orkney, Thirdly, there were ancient monuments not included in the schedule of the Act of 1882, but which had since been taken in charge by H.M. Office of Works under that Act by order in Council, viz. ancient Runic Cross at Ruthwell, Dumfriesshire; St. Ninian's Cave, Wigtownshire; the Pictish Tower of Carloway, Lewis; cup-marked rock of three standing stones, Drumtroddan; the Moat Hill of Druchtag, semi-circular earthwork, Barsalloch, and the ancient chapel of Whithorn, Wigtownshire; sculptured stones at Essie, Forfarshire; Roman camp at Rispain, and standing stone at Blairbowie, known as the Wren's Egg; and sculptured stones at Whithorn Priory, Wigtownshire; sculptured stones in Dyce churchyard, Aberdeenshire. Mr. Oldrieve explained next the working of the Ancient Monuments Acts, and pointed out that while the object of the earlier Act was the preservation of ancient monuments consisting for the most part of prehistoric remains, dolmens, ancient forts, &c., the Act of 1900 had a much wider scope, as therein "monument" meant any structure, erection or monument of historic or architectural interest or any remains thereof.

Mr. Oldrieve proceeded to show by means of limelight other important historical buildings under the charge of the Board of Works on which certain restorations had recently been made. First among them was Edinburgh Castle, the care of which, he said, had now been transferred from the Royal Engineers' Department of the War Office to H.M. Board of Works. One of the first things that was done was to rearrange, at a cost of about 1,000*l.*, the fire appliances at the castle, and it was now on that account much safer from fire than it had formerly been. They were now considering how best to remodel the block known as the "new barracks." He was quite alive to the necessity of moving very carefully in the matter, and before anything was actually attempted upon the building itself he should endeavour to have not only photographs and perspective sketches from various standpoints, but a model prepared for full consideration. As to Holyrood Palace, he mentioned that, among other things, an old sculptured panel which had been removed at the time of the Commonwealth would by-and-by be replaced in a recess in one of the turrets. It bore the Royal Arms of Scotland with Unicorn and St. Andrew's Cross. Another little bit of restoration work had just been done in Queen Mary's Audience Chamber by the removal of a comparatively modern partition which divided the room into two parts. Visitors would now be able to see the chamber practically as it was at the famous interview of John Knox with Queen Mary, and it would be worth while to look at the old ceiling now that it could be properly seen, especially as it was the only ceiling at Holyrood which was part of the original building as occupied at the Queen Mary period. He also mentioned that an interesting little stair which had until recently been kept closed, between the audience chamber and the prison cells above, had now been opened to view. Mention was also made of what was being done for the restoration of the tapestries in the Palace of Holyrood and for the preservation of the grave slabs in the Chapel Royal. He next directed attention to the restoration and redecoration of Parliament Hall, which has been already described, and reference was also made to preservative work which had been executed at Linlithgow Palace, at Dunfermline Abbey, at St. Andrews Cathedral, where, in September last, stone coffins of the Priors had been discovered; at Arbroath Abbey, Dundrennan Abbey, Fortrose Cathedral and Haddington Abbey.

Concerning Rosyth Castle, he said it was generally known that that old keep formed the central feature of the proposed naval base on the Forth. This was one of the cases in which the Board of Works were acting as architectural advisers to the Admiralty. It was thought that the old keep might be restored for the purpose of utilising the accommodation available in some way connected with the naval scheme. Accordingly designs had been prepared for a restoration, one principal apartment being utilised as a reading-room for naval officers and another for the purpose of a naval museum. The plans were now under consideration of the Lords of the Admiralty, and it was hoped the scheme might receive sanction. It would certainly be a pity to let the building fall into decay since it was of some historical interest. Two dates were found upon the building, one 1561 and the other 1635 and 1655; along with these being some initials (which might be "M.R."), an anchor, and "S.M.N." He mentioned that Mary Queen of Scots landed at Leith about the first date. In conclusion, Mr. Oldrieve said he would be always very pleased to receive information and suggestions which might help to conserve those national treasures.

On the motion of Professor Baldwin Brown, seconded by Mr. Hunter Crawford, Mr. Oldrieve received a cordial vote of thanks.

WOLVERHAMPTON ASSOCIATION.

THE annual general meeting of the Wolverhampton and District Architectural Association was held on the 18th inst., at the Law Library, Lych Gates, when the following officers and Council for the ensuing year were elected:—

President, Mr. Fred T. Beck; vice-president, Mr. W. Edwards; members of Council, Mr. T. H. Fleeming, Mr. J. Lavender, Mr. Ashton Veall; hon. treasurer, Mr. Harrison Weller; hon. auditor, Mr. A. Eaton Painter; and hon. secretary, Mr. W. J. Oliver, 1 Darlington Street, Wolverhampton.

Mr. W. Edwards, the vice-president, presided in the absence of the president (Mr. Beck) owing to indisposition, who was therefore unable to deliver his annual address, the meeting being of a purely business nature.

The Late Mr. Hyman Henry Collins, F.R.I.B.A., F.S.I., of 61 Old Broad Street, E.C., and Maida Vale, W., architect and surveyor, and an alderman of Paddington, has left property valued at 35,461*l.*

LIVERPOOL ARCHITECTURAL SOCIETY.

ON Monday Mr. T. T. Rees read a paper before the Liverpool Architectural Society on "Architects and City Improvements." The author said that he did not propose to deal with garden cities, but rather to take cities as they stand and suggest their improvement. To begin with buildings, why should not British municipal authorities have power, as in continental cities, to regulate the appearance of a house front? The German towns offered examples of open spaces more accessible to the poorest inhabitants than were those of Manchester, for instance, to the richest. The people of the large German towns were, thanks to better environment, more robust in appearance and, on the average, taller and broader than the people of the larger British towns. By pursuing, or not correcting, the old plan of crowding of the population, health committees were incurring tremendous liabilities in the future. Bidston Road, Birkenhead, might serve as an illustration of modern tendencies. It ought to have been twice the width, with a tree-planted footway in the centre, like Prince's Road, Liverpool. Every street over 50 feet wide in the crowded parts of a city ought to be planted with trees, and no new streets should be less than 50 feet in width. The Corporation ought to have power to insist on streets being continuous, and not blocked by an arbitrary landowner. Having contended for the more systematic cleansing of streets and for the abolition of overhead wires, the lecturer proceeded to advocate land purchase by municipalities on their borders. The pioneer action of the Prussian Government in this respect should be followed. Municipalities ought, of course, to supervise and control private restrictions as to building, thus preventing the deterioration of property. Having commended the gift to Liverpool by Alderman W. B. Bowring of the Roby Hall estate, and extolled the former wisdom of Birkenhead in buying its chief park, he expressed a desire to see Sir Joseph Paxton's beautiful designs for that park carried fully into effect. He wished also to see the system of placing seats in the grounds of places of worship become more general. Contrasting Hamilton Square, Birkenhead, and St. John's Gardens, Liverpool, he praised the simplicity and effectiveness of the former to the disadvantage of the latter. The continental principle of placing important buildings on prominent sites required greater study in this country. Moreover, England lacked the continental censorship of hoardings and posters. Chicago permitted no hoarding in a residential street without the consent of three-fourths of the inhabitants. Edinburgh had obtained power for its Corporation to license positions for mural advertisements. The advertisements round the Queen Victoria Memorial in Liverpool had proved a sore trial to the nerves of many. He paid a tribute to firms adopting artistic posters, and denounced the employment of sandwichmen as "a disgrace to a civilised nation." Turning to the smoke nuisance, he doubted whether British municipalities took pains to exercise their full powers. In conclusion, Mr. Rees advocated that architects should set themselves to awaken civic pride, which would have financial as well as artistic and hygienic fruits.

The discussion was adjourned until the next meeting.

Correspondence

Day Courses for Architectural Students.

SIR,—In your issue of the 5th inst., under the heading of "Architecture in 1905," you say, referring to the scheme of day training now becoming general for architectural students, "The system brought into working existence by the Architectural Association has formed the model on which educational methods have been based by University College and King's College, London, by the universities of Manchester and Liverpool," &c.

May I be allowed to point out that the first comprehensive day course of training for architectural students in England was instituted by me over eleven years ago, viz. in October 1894, in the University of Liverpool (then University College), and consequently several years before the Architectural Association attempted any day course. The course, a two years' one, was for students before they entered an office, and the whole of their time had to be given up to the work. When I returned to London in 1903 there were about twenty-five students taking either this course or the degree course (B.A.) which had been instituted about three years previously.

The present two and three years' courses at University College, London, are on similar lines to the ones I started in Liverpool, and are not based on any course or courses of the Association.

If you can find space for this letter I shall esteem it a favour.—Yours faithfully, F. M. SIMPSON.

January 17, 1906.

P.S.—I enclose a pamphlet published in 1895, in confirmation of the above statement.

GENERAL.

Mr. Jerry Barrett, the painter, died at Harrow on last Sunday in his eighty-second year. He painted several Court scenes, which were engraved.

Subscriptions are sought by the committee, of whom M. Bonnat is president, for the erection of a monument to the late W. Bouguereau, the French painter, who died last year.

Mr. Banister Fletcher is to deliver a course of University lectures on "Architecture" at the South-Western Polytechnic.

The Brighton Borough Surveyor has been instructed to keep a book with counterfoils of all orders for extras under contracts. This book is to be submitted to each meeting of the committee.

Mr. J. S. Sargent's portrait of Miss Ellen Terry as Lady Macbeth has been presented by Mr. Duveen, sen., to the National Gallery of British Art.

The Late Mr. L. T. Ashwell has bequeathed 500*l.* to the Artists' Benevolent Fund.

The Education Committee of the Bournemouth Town Council have secured a site on which to erect a school for the purposes of centralising the higher branches of science, art and technical instruction in the borough. The number of students in the various schools last year increased from 1,100 to over 1,300.

The London County Council on Tuesday decided "That it be referred to the general purposes committee to consider and report whether, having regard to the fact that the work included in the references to the highways, Building Acts, improvements, rivers and bridges committees is intimately connected with the provision of adequate facilities to cope with the traffic problem of London, the time has not arrived when, with a view to co-ordinate the various methods of dealing with this problem, it is desirable to establish a traffic committee."

The Swansea Town Council having resolved that it is desirable to erect a pavilion in Victoria Park, recommend:—(1) That designs be invited by public advertisement for a pavilion to seat 12,000 persons at a cost not exceeding 15,000*l.*, and that a premium of 50*l.* be offered for the accepted design, such design when paid for to become the absolute property of the Corporation.

A Bill has been introduced in Washington to authorise the adoption of the metric system from July 1, 1908.

The New Working Men's College in Crowndale Road, St. Pancras, was opened by Sir William Anson on Saturday evening. The site, buildings and equipment have cost nearly 30,000*l.*, of which 20,800*l.* has been recovered by the sale of the buildings in Great Ormond Street, and 8,800*l.* donations to the building fund. The new buildings have been designed by Mr. W. D. Caroe.

The Ceiling of the large hall in the French Ministry of War, known as the Salle de Marechaux, fell last week and destroyed all the furniture. Fortunately there was no Council engaged at the time.

Probate of the Will of Mr. John Feeney, proprietor of the *Birmingham Daily Post*, has been proved. As has been already announced, the testator bequeathed to the Corporation of the city of Birmingham the sum of 50,000*l.*, to be applied by them towards the cost of erecting a new picture gallery on a site provided by the Corporation, and he directed that if the whole legacy should not be so expended any surplus should be expended on buying paintings by the old English masters. To the Birmingham University 20,000*l.*, to be invested by that body, and the income thereof to be applied in maintaining a professor, with suitable equipment, lecturing on some one or more scientific subjects directly connected with some one or more of the trades and industries carried on in or near Birmingham.

The Architect.

THE WEEK.

THE plan by Mr. WHITIE, which was selected in the competition in the Mitchell Library, Glasgow, did not fully meet the requirements of the librarian. Another plan was accordingly prepared which would provide the librarian with the necessary accommodation, and which would be capable of extension. The alteration, however, will entail an additional outlay of 5,850*l.*, including 1,800*l.* for a dome. The representative of the libraries committee mentioned that it had been said that it was hardly fair to the other competitors to introduce so great alterations on the design selected; that if they had known they could go to 50,000*l.*, designs more fitted for the purpose would have been submitted. But the Corporation, he said, fixed no limit; they simply said that, in their opinion, the necessary accommodation might be provided for 40,000*l.* They left the architects, however, to judge for themselves, and, as a matter of fact, not one of the designs came within 40,000*l.* The one preferred reached close upon 50,000*l.*, and any design that might have been selected would have required considerable modifications, and additional expense would have been incurred. It was also denied that the plans of other competitors had been appropriated. All that had been done was to adopt portions of the premiated plans, to which they had a right. There was no opposition, and the amended plan was accordingly adopted.

WE published some weeks ago the report of the Building Act committee of the London County Council recommending that district surveyors should be paid by salary instead of by fees. Fees were to be levied as before, but they were all to be handed over to the Council. It is remarkable that the architects of London seem to be indifferent to the proposed change, and it might consequently be inferred that officials who were paid fixed salaries would be as acceptable as those who received fees. The main consideration must, therefore, have appeared to the Council as one of profit. Assuming that under the new system the cost of the officials would eventually be 40,245*l.* per annum, while the fees amounted to 50,748*l.*, and were likely to be increased, a margin was left which would secure the Council against loss. The salaries to be paid were, therefore, arranged at 1,000*l.*, 800*l.* and 500*l.* a year, and there would be also the payment for assistants and clerks. The finance committee, on examining the proposal, took a less sanguine view of the results. They considered the staff to be insufficient, and that there would not be the same incentives as at present to secure the payment of fees. The subject was discussed at the meeting of the County Council on Tuesday, and eventually it was decided by fifty-nine votes to forty-nine that the report should be referred back for further consideration. Whether any other steps will be taken in the matter is doubtful, for the advantages of the change are not evident.

THE jury for the architectural section of this year's Salon exhibition will be elected on the 21st inst. It will consist of thirty-six French architects, who will hold office during three years. The electors are to consist of French architects who have received medals or other awards from the Salon, French architects who have been received in the Legion of Honour, and architects who are members of the Society of French Artists. All architects who wish to vote personally will have to present their voting card. Voting by correspondence will also be allowed. The bulletin must be manuscript. If it is a printed document, or contains more than thirty-six names, it will be rejected. All the bulletins should be sent before the close of the voting to the president, and to each the voting card of the elector is to be affixed. From these regulations it will be seen that the thirty-six jurors fairly represent the architectural profession in France. If drawings are not exhibited in 1906, it may be assumed that they were deficient in artistic or constructive qualities.

ERRORS in quantities occasionally arise from substituting one kind of designation for another, as square feet for square yards. But as the contractors know that certain kinds of work are measured by a fixed rule, errors in tenders or accounts rarely follow the substitution. A case consequent upon so simple a mistake has gone through the whole course of the Scottish courts. A firm of contractors were employed to erect tenement houses in Stonehouse. Contrary to the usual practice, the chimney stalks were to be priced in the schedule at a rate per square yard instead of per square foot. Six contractors tendered. Three put down a price per square yard, while three charged per square foot—one of them being the successful firm. On the completion of the work the architect valued the chimney stalks per square foot, and the contractors were paid at that rate. The building owners afterwards imagined that the architect had paid for that part of the work nine times the proper price, and they brought an action against the builders to recover 78*l.* The Sheriff-Substitute found for the plaintiffs. But on appeal the Sheriff reversed the judgment. Then the case was brought before the Court of Session and four judges. Their lordships affirmed the Sheriff's judgment in favour of the contractors. Their lordships held that the price charged was a fair and usual rate per square foot, and that the money received was due in equity. The plaintiffs had failed to prove that the money was not equitably due. The discovery of mare's nests sometimes causes ridicule. But in this case it is satisfactory to know that the clever discoverers will receive their reward not only in being made the subjects of laughter, but in having to pay the costs which arose in the three courts.

THE House of Lords has decided, in the case of KIRBY *v.* Assessment Committee of the Hunslet Union, that when premises, used as engineering works, are assessed for the purposes of a poor-rate, the value of the machinery on the premises to a hypothetical tenant, though not affixed to the land, must be taken into consideration in arriving at their rateable value. If the premises and the machinery are occupied together, so that in substance the thing demised is a factory, the whole concern, building and machinery alike, is rateable; and obviously in such a case the machinery must be taken into account as enhancing the letting and therefore the rateable value of the property. The landlord and the tenant may have made special contracts as to the ownership of the machinery, but the rating authority cannot regard these contracts. The premises must be looked at in their present condition, and if the machinery enhances their letting value, that value so enhanced is the basis for rating.

WHAT promises to be an important work is announced by the Caxton Publishing Company. The title is, "Modern Buildings: their Planning, Construction and Equipment." There will be six volumes, which will treat systematically of planning, construction, specification writing, quantity surveying, dilapidations, heating, ventilating, electric and gas lighting, drainage, internal fittings and decorations, &c. The general editor is Mr. G. A. T. MIDDLETON, vice-president of the Society of Architects, who will be assisted by a staff of writers who are experts in their various departments. The first volume, which will be copiously illustrated, is to be issued immediately.

Digitized by Google

EMILE BOUTMY.

A DISTINGUISHED Frenchman, Émile Boutmy, died last week in Paris. He could be considered as one of the last of the doctrinaires. According to Littré, politicians were so named who, at the Restoration, endeavoured to lay down the doctrines of representative government. Stuart Mill and Grote were English types of the species. A good many years have passed since Louis XVIII. returned after the downfall of Napoleon. But it is still believed, at least by a minority, that the neglect of the principles which the doctrinaires established has caused most of the troubles in France. Accordingly, after the Franco-Prussian war, M. Boutmy founded a school of political sciences which was open to all who cared to study the doctrinaire system of government. He presided over it until a short time preceding his death; and to the end he remained confident in the belief that if France is to attain the position in Europe which should belong to it Frenchmen will have to adopt a definite theory of the kind which he advocated.

We have nothing to do here with politics, and need not, therefore, consider whether M. Boutmy's teachings were in any way applicable to Great Britain. If we refer to his effort as an amateur legislator, it is merely because that was one of the manifestations of his nature. John Locke prepared a constitution for the American colony of Carolina, and he was only one among many philosophers, each of whom considered that his own theory of mind was universally applicable. Émile Boutmy was formerly a professor in the École spéciale d'Architecture in Paris, and his lessons on æsthetics corresponded with those he delivered on politics. "Show me your company and I will tell you what you are" is a very ancient proverb; and when it is known that Boutmy was the closest friend of Taine, students of French literature will be able to infer what was the bond between them. Taine, in common with a certain class of philosophers, believed in the inevitableness of everything that happens. All that has to be done is to master the terms of the syllogism of life, and there is no difficulty in foreseeing the conclusion. When Taine said that a sonata of Beethoven was as perfect as a syllogism, he was expressing an idea that was familiar to his friends. In various ways everything to him assumed a syllogistic form, and we suppose he would have demonstrated that his old clothes—for he was the shabbiest man in Paris—were sublimated by being part and parcel of some wonderful proposition. As for analysis, he believed the method adopted by botanists with a flower was equally adapted to peoples, epochs and races.

A notion of the system and its rigidity can be derived from the book which Boutmy wrote, and which he called "The Philosophy of Architecture in Greece." Taine described it as the work of an eminently philosophic spirit that had a passion for general ideas, that could systematically arrange them and follow out their consequences to the smallest detail. The analysis was said to be the true light which enveloped the subject. Boutmy was described by his friend as the most faithful of the votaries of the ancient Greeks, and who from being imbued by the Greek spirit naturally and invincibly followed their methods. If some young architect employed by Ictinus, and who had listened to the dialogues of Socrates, wished to explain the *ensemble* and the details of his art, it would be, according to Taine, with the minuteness, fairness and dexterity which Boutmy employed. When it was considered that the treatise was the author's first book Taine's praise becomes the more remarkable. It is well to remember that Boutmy's treatise appeared in 1870; and in the thirty-six years which have followed our knowledge of the Greeks has increased to a surprising extent. The only modern investigator referred to in the pages is, if we remember rightly, the late F. C. Penrose. If they were acquainted with the organised excavations in Greece, Boutmy as well as Taine might have modified their theories. Some critics would perhaps say that the conclusions are independent of and would not be affected even by Schliemann's discoveries.

Boutmy begins by explaining that the Renaissance artists and their successors held an erroneous notion about Greek architecture from the belief that Vitruvius had produced its bible and that his imaginary diagrams represented authentic examples. Greece was studied through Rome, and it required some ages to realise that Roman architecture was no more than a "noble and generous translation" of the original, like Dacier's "Homer." Fortunately it was perceived that Vitruvius was only a compiler from Alexandrian theorists, for the man who asserted that the Doric order was never employed for temples, and that the temples were so arranged that the statue should face eastwards, could not have seen a genuine Greek building. Credit was given to the students of the French school in Rome for their efforts. But it was pointed out that it was not until 1845, when Ballu made a restoration of the temple of Athena Polias, that an authentic Greek work was presented. It was only, in fact, in Greece that the psychology of the architecture could be explained.

Among all the temples Boutmy selected the Parthenon as his model. He first considered it in relation to the geography of Greece. With no class of men is the importance of geography more valued than with philosophers of the school of Boutmy and Taine. They believed they could discern a relation between the soil and the inhabitants. Everywhere in Greece, as the former points out, there were barriers to travelling, and even at the time of Strabo the roads and rivers used for traffic were in the most miserable state. The sea compensated for the shortcomings of the land, for Arcadia was the only part without natural harbours. The people were therefore navigators almost from birth, and as with the Vikings, piracy was honoured. The inhabitants were like sea and land, for there existed at least two races differing in qualities, whom we know as the Dorians and the Ionians. In Athens there was a conciliation of the two. From the dramas of Æschylus to the sculptures of Phidias intellectual work carried the imprint of duality. And Boutmy concludes by saying that majesty and grace, rule and independence, sobriety and richness of effect are alike sensible in the Parthenon, which thus represents the physical character of Greece as well as the ethnography of its inhabitants.

It is next pointed out that what was generally known as Greece was a poor country. Indigence, says Herodotus, is our foster-sister. The colonies were in advance so far as related to riches and opportunities for leisure. Wealth exercised its usual influence on the erection of temples. Some of the most important were outside the boundaries, while for those raised in Greece several years had to elapse before they were completed. The practice of meeting in assemblies was also a factor, for it led to the creation of cities. The Eastern invasion likewise served progress, for according to Aristotle it was only after the war with the Medes that the Greeks cultivated wisdom and virtue. Unlike the Easterns, the Greeks respected artists as well as poets; and not an instance is known of a slave practising painting or sculpture among them. The artist, besides being free born, was not a tool of the priests. His patrons were the public. The commissions for public edifices, Boutmy points out, were not given in an official bureau. Each competitor had to carry his plans and estimates before an assembly, and to defend them against objections. His accounts were also investigated in public, and in Ephesus there was a law declaring that the artist out of his own property must make up any excess of outlay over his estimate.

The psychology of Greek architecture begins, according to Boutmy, with a consideration of the Greek individual, who, curiously, was also closely con-

Digitized by Google

nected with idealism. The greatest revolution ever made in the human spirit was, he said, the recognition of the hero. In the East, and in Greece at an early time, man seemed to be subjected to the forces of Nature. HOMER represents rivers as if they were living beings who took part in war. But the heroes defied nature, and approached in popular imagination to the gods. The human form in course of time became a type with the Greeks of what was greatest in creation. Architecture, in the East and in Egypt, became from its vastness the representative of the great physical forces; painting and sculpture were made subordinate to it, and were, as BOUTMY says, like the vignettes in the illuminated service books of mediæval ecclesiastics. The Greeks avoided the erection of such colossal buildings as were seen elsewhere, and in course of time sculpture was allowed to be independent and eventually to take precedence of architecture in public esteem. The great writers do not recognise architecture. BOUTMY points out what is recorded about PHIDIAS, the sculptor, being the chief officer of works at the Parthenon instead of ICTINUS, the architect. The reason was, he said, that the Greek temple was erected mainly as a shrine for the statue or idol, which was sometimes formed of gold or other precious material. Greece at one time may have imitated Eastern practice in having walls lined with gold and silver or covered with rich stuff. But that period was superseded by another, in which wealth was expended not on the temple but on its statue.

Coming closer to the Parthenon, BOUTMY considers the distinctness with which everything is still seen in Greece. There were no trees of large size, and the few forests were only to be found at a distance from the centre of the intellectual movement. Everything was so simple that the variety of forms which charmed the Eastern artist would have given pain to a Greek.

There was so much rock its qualities were not without effect on the architects, and BOUTMY does not hesitate to say that the Parthenon was a crystal, and one of a most simple kind. Although it was supposed to have been derived from a structure of timber, there was nothing in the temple that could recall vegetable forms. In the details there was the same love of geometrical lines. The ornamentation was also of extreme simplicity, formed by the repetition of an element which was very small and very distinct. In fact, the ornament resembled the borders of robes, and was intended to mark the limits of a surface. As to the polychromy which was used in the ornamentation, BOUTMY does not approve of it. To him it exemplified a tolerance which was unusual and contradictory of what was believed about the predilections of the Greeks for simplicity and neatness.

It is pointed out that in the Greek poets there is a remarkable study of detail, which could only be obtained by the exercise of a developed power of analysis. A similar power is to be witnessed in Greek architecture. Unlike the Romans, who were indifferent about repetitions of the same form to serve various purposes, the Greeks recognised the office which each member of a building was to fulfil. They differentiated the parts to gratify the spectator, and they suggested the nature of the function which each part had to perform. Even the wall of a *cella* is shown to be only required for the purpose of separation, and not for support. The office of sustaining a load was entrusted to the columns. The columns for that reason were never cut into niches to hold statues, as is common in Hindu architecture, and, in fact, in no part of a Greek temple is a place found for sculpture which suggests a weakening of the masonry. Even the Egyptian columns, massive as they are, are made to suggest weakness by the bands which encircled them, and which were derived from the means employed for tying bundles of reeds. BOUTMY saw in the Greek temple an example of the strictest logic, and shows its relation to the old dialectic. In the subordination of its parts he sees a correspondence with the Greek rules of literary composition.

The final part of BOUTMY's treatise suggests that in the erection of a temple the Greeks were utilitarians. It is now common to consider the temple as if in its construction it resembled some great ornament which had to be complete in itself. But it is explained at length that the purpose of a Greek temple was to shield either a statue or some piece of wood or stone with which legends were associated. Sometimes the temple was called the edifice in which such a figure was to be found. The Erechtheum was known as the temple containing the old statue, *i.e.*, the Athene Polias, to whom the Panathenaic peplos was dedicated, rather than to the goddess of the Parthenon. The planning of the Parthenon was adapted to the purpose of displaying the statue which PHIDIAS produced. There was no certainty about the way in which the building was lighted, but there is little doubt that the lighting was arranged with skill and ensured that dim religious light which enhanced the importance of the figure. The building also served occasionally for secular purposes, and we suppose the Athenians did not consider it was discreditable to allow DEMETRIUS and his wild companions to use the opisthodomos for a dwelling.

We must, however, end our notice. M. BOUTMY's book is not one of which an abstract can be made with advantage, for every line of it is worthy of consideration. Admiration of architecture in any form should always be welcome. It is, of course, difficult to explain how so perfect a structure as the Parthenon could have been constructed. It was, however, no accidental production, for the contemporary sculpture, literature, and, it may be, the paintings, were no less remarkable. It is easy to explain the surroundings of the temple and to believe that the forms impressed themselves on the designers. We can also allow for the character of the race. But the difficulty remains of explaining why the Greek artists surpassed those who lived in similar or more picturesque regions, and who also had an inspiring history before them. There is the mystery which ÉMILE BOUTMY has failed to disclose, in common with a great many other inquirers.

A DUBLIN BUILDING GUILD.

WITH the exception of the two cathedrals and a part of the city wall, there is little to be seen in Dublin which indicates the antiquity of the city. From its position it was attractive to invaders. The Danes possessed an important part of it prior to the Norman-Welsh invasion at the close of the twelfth century. In 1205, or about thirty years after STRONGBOW's appearance, orders were given for the erection of a castle in Dublin which stood on the site of the existing group of official buildings. A wall was erected to protect the parts occupied by English settlers, and in the fourteenth century a new line of defence was raised.

It was to be expected that the organisation of the inhabitants of Dublin should bear some correspondence with that of London. In the fifteenth century several trade guilds appear to have been established. The tailors obtained a charter in 1418; the barber-surgeons, apothecaries and wig-makers in 1446; the merchants in 1451, and the shoemakers in 1465. On various occasions processions of the trades, with banners and other insignia, can still be seen in Dublin; but it is not to be supposed that there exists any direct relationship between the modern societies and the ancient guilds. The men who march through the streets are members of trades unions.

It suggests the indifference to building of a substantial class which prevailed in Dublin, when we find that the Guild of Carpenters, Masons and Heliers, or Tilers, was not established until 1508, or three centuries after the time when a castle was erected. The guild for some unknown reason had also to include the millers. A

Digitized by Google

volume of the minutes of the guild between 1513 and 1564 was purchased by the Dublin Corporation at the sale of the manuscripts of Sir JOHN GILBERT, the historian of the city. An account of it is given by Mr. H. F. BERRY in the last number of the Journal of the Royal Society of Antiquaries of Ireland.

There must have been carpenters, masons and tilers in Dublin at an earlier time. In 1366 a decree was issued by the body which served for a Corporation, allowing masters to make agreements to work for 2*d.* a day, with their dinner. The law of 1349, known as the Labourers' Statute, had to be obeyed in Dublin as in England, and it enacted that carpenters, masons, tilers and other craftsmen should not seek higher wages than were paid in preceding years, and if anyone took more he was to be committed to the nearest gaol. This was one of the efforts of perplexed rulers to prevent the working of what may be called the inevitable laws of political economy. It was the first attempt in this country, and was followed by several others intended to produce the same effect until the time of GEORGE IV. But there was some excuse in 1349. The plague, which was known as the Black Death, had passed over Europe, and it is supposed one-third at least of the inhabitants perished. Labour was scarce, and instinctively men demanded higher wages. The carpenters, masons and tilers of Dublin had to submit to the restrictive policy which EDWARD III. enforced in England. Another Act was passed some forty years afterwards which provided that master-masons of freestone, master-carpenters of free work able to be masters of their art were to take for the whole day 2*d.*, and other masters of the said arts by the day 2*d.*, and others of the said arts by the day 1½*d.* Master-heliers of slate, master-plasterers of walls, 2*d.* Heliers of stone, workers of walls and other labourers able to serve the artificers aforesaid, by the day, 1*d.* It is now impossible to determine exactly the value of pence in Dublin in the fifteenth century, and the position of the craftsman may not have been deplorable. If it corresponded with that of the English craftsman the men who received 2*d.* a day were able to live well.

There was some doubt about the preservation of the charter which was granted by King HENRY VII. in the last year of his reign, for in 1583 the Corporation of Carpenters presented a petition that a certain document which bore a part of a seal should be accepted as the original charter. According to it women were eligible for membership as well as men. This would suggest that the Dublin guild resembled many others in different parts of Europe and was not established for the sole purpose of advancing the trade or mystery. In modern times we imagine the guilds to have been the main cause in the improvement of different trades. But it is doubtful whether the Mediæval guilds cared more for the education of the members than the modern trades unions. On the contrary, they seemed rather disposed to prevent the advance of the industry they represented; and, in fact, they appear to have exercised a large amount of tyranny. The Dublin Guild of Carpenters, Masons and Heliers, for example, could, under warrant of the master and wardens, send members as prisoners to gaol. The apprentices had to serve seven years, which seems to be an unnecessarily long period of training for the work which had then to be done. After serving the apprentice was to be brought by the master of the guild to be admitted to the freedom of the city. The apprentices were to be free and of the English nation, which did not, we suppose, mean they were to be born in England, but rather to belong to the English Pale in Ireland.

In the trade regulations of some foreign guilds it was necessary for everyone who served his term of apprenticeship to undergo strict examination and to submit trial pieces. But in Dublin it seemed to be more important to secure the franchise of the city, for otherwise an apprentice would lose his membership. In the last century the Dublin freemen gained notoriety by their conduct at elections, and it might be supposed that in the sixteenth century there were wire-pullers who took care that the carpenters, masons and heliers should be able to furnish the proper number of "citizens" whenever there was occasion for their services. Every brother of the guild had to take an oath that he would be faithful and true to the masters and wardens, that he would meekly obey and answer them, keep secrets and allow no man to hurt the fraternity, and also reveal to the master and wardens anything that might be done which would be hurtful to the brethren. In 1513, or five years after the founding of the guild, it was decided that a member was to pay 3*s.* 4*d.* if he employed any foreigner to work with him when he might have engaged another member of the community, as well as 4*d.* per quarter. Any guildsman who defamed or blamed the master had to pay 6*s.* 8*d.*, and for disrespect to the wardens 3*s.* 4*d.*

The Dublin guild, like those elsewhere, was to some extent a religious confraternity. The officers were selected at a meeting in the lady chapel of the church of St. Thomas. Fines were sometimes levied in the shape of wax for the lights. If the master or wardens did not appear on quarter days, unless prevented by just cause, they had to contribute a pound of wax. Eighteen members on one occasion had each to forfeit a similar quantity, and the beadle was also to pay likewise if he failed to warn them. Among the accounts are entries for the preparation of the wax or its conversion into torches. On one occasion the wax-maker received 2*d.* A woman was paid 14*d.* Another time a waxman for his labours was paid 20*d.* At these times meat and drink was supplied, The price of the wax varied. At one time it was 1*s.* per pound. It is remarkable that after the Reformation was established in England the practice of supplying wax for lighting images was tolerated.

In the sixteenth century the majority of the houses in Dublin were likely to have been constructed of timber. On that account there would be less demand for masons. The carpenters seem to have almost monopolised this guild. Mr. BERRY says:—"A strong reason for the small number of masons within the guild will, perhaps, be found in the fact that it was customary at the time for masons to form into bands and companies that worked together under master masons, and the members of these roving companies would not be enrolled as freemen of the city guild." We are also informed that "in 1522 the guild consisted of thirty-three carpenters and heliers and four masons. In 1547, twenty-three carpenters, twenty-four journeymen carpenters, ten heliers and five journeymen heliers. In 1555, thirty-four carpenters, nineteen journeymen carpenters, nine masons and six joiners. In 1560, sixteen carpenters, eleven journeymen carpenters, six joiners, five heliers, three journeymen heliers and one mason. The few millers belonging to the guilds were not separately classed but appear among the carpenters." The master and one of the wardens were carpenters, the second warden a helier.

We are able to obtain some glimpses of the business transacted in the guild. In 1537 we learn that one member was promised the roofing of a church, but another member was entrusted with the work. The latter had to pay 3*s.* 4*d.* to his rival and 3*s.* 4*d.* to the guild. In another case a carpenter entered into an agreement that he would not execute mason's work. A helier was fined a noble for the use of slanderous words. An apprentice in some way offended his master, a carpenter. The offence is not mentioned, but the apprentice was informed that if he again transgressed one of his ears would be slit and he would have forty days' imprisonment.

The volume of proceedings ends in 1564. In the preceding year the famous statute of Queen ELIZABETH was passed, which regulated the hours of working, wages, apprenticeship and much else. It continued in force until the reign of GEORGE III. From some

Digitized by Google

entries which are given by Mr. BERRY, it is evident that in the following century the citizens of Dublin became more exacting in respect of the guild. It was ordered that those who followed the trades, including plasterers, should have ladders, ropes, trowels and scaffolds, so that the citizens should not be driven to provide anything for building or repairs save materials only. This is a remarkable revelation as to the manner in which work was carried out in the beginning of the seventeenth century. A defaulter was fined 12*d.* a day, and could be imprisoned until the money was paid. In 1620 there was another complaint about the practice of guildsmen undertaking more work than they could execute. And while work was spoiled and houses ruined, offenders walked the streets regardless of the damage done by them. It was resolved that on a complaint being made to the master of the company he could appoint another member to complete the work. And if the master neglected this duty the mayor could punish him by a fine of 20*s.* and imprisonment. It would appear that there was no superintendence of buildings in Dublin. The architect could not then have flourished. The workmen, so long as they were members of a guild, evidently allowed themselves the fullest liberty. Dublin was not, however, the only city in which laxity was permitted. We are thankful to Mr. BERRY for revealing so much about the defective system with which Irishmen were satisfied.

PUMPING OPERATIONS AND THE RIGHTS OF SURFACE OWNERS.

THE case of FLETCHER *v.* The Mayor, &c., of BIRKENHEAD has called attention to the injurious consequences to the neighbouring properties which sometimes follow upon the pumping operations of waterworks. In this case the defendants, under the authority of a private Act, had sunk a well about 180 yards away from the plaintiff's house. From this well they pumped large quantities of water for the supply of the district. The pumping operations resulted in withdrawing not only a large quantity of water from under the plaintiff's land, but also a large quantity of silt. The land, being left without support, settled, and the plaintiff's house was damaged. He brought his action against the defendants, and it was held that he was entitled to recover. The defences put forward by the defendants were based (1) on the Waterworks Clauses Act and the special Act of the Mayor and Corporation, and (2) on the general law apart from statute. (1) It was contended that the Acts gave the defendants power to take water, and that, as Parliament had authorised the act complained of, no cause of action arose.

Of course, an Act of Parliament may do anything; and if it is clear that Parliament has authorised the doing of an act which cannot be done without causing a nuisance, and has deliberately omitted to provide that the persons injured by the nuisance shall be compensated, no right of action will arise. But before coming to such a conclusion the terms of the Act must be closely scrutinised. "An Act of Parliament," once said BOWEN, L.J., "may authorise a nuisance, and if it does so, then the nuisance which it authorises may be lawfully committed. But the authority given by the Act may be an authority which falls short of authorising a nuisance. It may be an authority to do certain works provided that they can be done without causing a nuisance, and whether the authority falls within that category is, again, a question of construction. Again, the authority given by Parliament may be to carry out the works without a nuisance, if they can be so carried out, but in the last resort, to authorise a nuisance if it is necessary for the construction of the works." In this case it was quite clear that the Acts did give compensation for any injury caused to adjoining land by reason of the exercise of the powers conferred by the Acts. The defence based upon the special Acts therefore failed. (2) The second defence was based upon the fact that the law does not, as a rule, recognise any proprietary rights in underground water which percolates through the ground in underground channels. If A by pumping operations withdraws such water from under B's land, B has no right of action for its loss. But it by no means follows that, if A by his pumping operations withdraws water from under B's land, and thereby causes B's land to settle, B has no right of action. In fact, the question whether there is at common law any right of support for land by means of underground water, other than by virtue of an express or implied grant, is still an unsettled question. It seems, indeed, to be clear that if A and B are the owners of a swampy tract of land, A cannot prevent B from draining his soil, even though the result is to let down the surface of A's land. "If," it has been said, "it were held that no man could drain his own soil because, by so doing, he would also drain his neighbour's, and so let down the surface, the ordinary beneficial enjoyment of land would be impossible without agreement of all the landowners affected, and the rule would be, once a morass always a morass." But it does not follow from this that under no circumstances is there any right of support to land from water; nor is it clear that there would be no right of action if such water were withdrawn and a settlement were caused, not in the course of ordinary draining operations, but by extraordinary pumping.

It was not, however, necessary to decide this doubtful point of law in the case upon which we are commenting. What was withdrawn in this case was not water only, but water and silt; and it was clear from the case of JORDESON *v.* Sutton, Southcoates and Drypool Gas Company, decided by the Court of Appeal in 1899, that to withdraw water and silt so as to cause land to settle is an actionable wrong. That was a case of first impression; but the conclusion there come to was based upon an American case, in which the legal consequences of cutting through quicksand were discussed. LINDLEY, M.R., adopted the words and the reasoning of FIELD, C.J. of the Supreme Court of Massachusetts. "Whatever," he said, "may be true of percolating waters, we think that the defendants had no right to take away the soil of the plaintiff . . . and that it is immaterial that the soil was removed by means of pumps from the trench into which it had fallen of its own weight, and had been carried by percolating water. We are unable to distinguish the case from one where the soil falls in from the surface in consequence of an excavation in the adjoining land. The plaintiff, if the facts be as he offers to prove, has been deprived of the lateral support to his land, in consequence of which the quicksand has run from under the surface of his land into the trench, and has been removed by means of pumps, and this has caused the surface to settle and crack. It was the duty of the defendants to prevent this." Clearly therefore a person cannot let down another's land by withdrawing the support afforded by a bed of water and silt. Probably he cannot do so by withdrawing the support afforded by a bed of underground water, unless his acts in thus withdrawing the support are done merely as a necessary part of the process of draining his own land. But this proposition cannot be regarded as settled till some case of this kind has arisen for decision.

The Carpenters' Company have arranged the following lectures, to be delivered at their hall in London Wall on six Thursday evenings in February and March at 8 P.M.:—February 15, The Rev. W. Marshall, F.S.A., on "Some Points of Architectural Interest in our Parish Churches"; February 22, Mr. Bryce, M.P., Chief Secretary for Ireland, on "The Relation of Architecture to History"; March 1, Mr. A. E. Bernays, on "Greek Temples and Ruins"; March 15, Mr. E. Guy Dawber, on "The Yeoman's House in England"; March 22, Sir Herbert Maxwell, on "The Neglected Resources of our British Woodlands."

PROVISION FOR SCOTTISH ART.

THE annual dinner of the Royal Scottish Academy was held on Friday. The President, Sir James Guthrie, was chairman. The toast, "The Royal Scottish Academy," was proposed by Sir John Stirling-Maxwell.

The President, in replying, said he made no apology for restating that they had nothing like accommodation either for the training of their students or for the placing on record in their exhibitions of elements that must be represented if they were to keep in touch with the living forces of their time. Apart from this miserable drag upon all their efforts at progress, they had no reason to be other than gratified by the results of the year that had gone. How about the training of those who were to carry on the arts? How about the national treasure-house, that ought to reflect what Scotland feels and what Scotland thinks on a whole side of the national life? These questions were only too easy to answer. Both were utterly unrepresentative. Art education was relatively worse provided for in the Scottish capital than in any of the great cities of the country. As they were aware, the emancipation of our Scottish art schools from the control of South Kensington had been of vital moment. The Scotch Education Department had been developing a system that might well be envied in the sister countries, and that system was doing excellent work in the great natural distributing centres. But, in spite of excellent effort here and there, Edinburgh was in this respect too much a medley of conflicting interests, and unless these could be brought into line there was little hope. Yet these very Scottish Education Departments had at present a great sum of money, from which generous provision could, and, he believed, would, be made. Unless the Department could make broad suggestions, and the Town Council (without representing any interests whatever except those of the city and country) could second them, the shame of being behind where it ought to lead would remain with this historic city. He looked with confidence to the Scottish Education Department, since he believed no other influence was strong enough to co-ordinate the excellent material they had. As to the National Gallery, it remained for Parliament to say what its fate was to be. But the real issue rests with the Scottish members of Parliament. It is to them we owe the attitude assumed by the Chancellor of the Exchequer, Sir Michael Hicks-Beach, which led to the appointment of a Committee by that staunch Scotsman, Lord Balfour of Burleigh. In the discussion initiated by Sir John Stirling-Maxwell, one of the Scots members expressed the hope that the inquiry into the whole subject promised by the Chancellor of the Exchequer was not going to take four or five years, during which Scotland should be gasping in vain for assistance. Well, the inquiry was conducted by the Committee with despatch, when we consider how fully they went into the matter; but although a fragment of their recommendations, in the shape of the annual grant, had been carried out, three and a half years had passed, and the main needs had not yet been met. So Scotland was still waiting. But he took encouragement from the fact that the Member whose timely words he had quoted had now some say as to how long she was yet to gasp, for he was at this moment the First Minister of the Crown—Sir Henry Campbell-Bannerman. But the matter could not end here, for in spite of the adage that the best way to bury a thing was to have a Royal Commission on it, he was certain that no fair-minded member of Parliament—Scotch, English or Irish—could blink the issues so clearly brought out and stated by that Committee. One of the most important of these was concerned with the Scottish annuity money. He thought they had no doubt as to the benefits that had flowed from the Union, but it was disconcerting to find that nearly 200 years after there was still misconception as to their clear right to the money for which so much was given then. For half a century that money had been made to do duty for expenses which, in the case of the two sister countries, were borne by the Imperial funds. The time has surely come when her own must be paid to her once for all. They might call the present concern a National Gallery. Would anyone pretend that a set of rooms with a third of the space of the National Gallery of Ireland (exclusive of the National Portrait Gallery of that country), less than a third of the space set apart by Glasgow in her main galleries for pictures alone (exclusive of handsome provision for sculpture, architecture, drawings, &c.), gave scope for a true mirror of Scotland's appreciation of the arts of painting, sculpture and architecture? The truth was Scotland had long ago exhausted the possibilities of an arrangement made half a century ago. Her National Gallery had been in a strait waistcoat these many years. Everything must be reconsidered. Accommodation and administration alike cried out for justice. As to the latter, clear financing and organisation must take the place of what had become obscurantism. It was not necessary that they should expect a dead lift on the part of the Government of the whole weight of the undertaking, but it was necessary that they should know what the Government was going to do. Nothing could clear the ground for a start worthy of the nation until this was done. If they got the gallery on the right scale Scotland would fill it worthily, never fear. But until they did the uncounted years were slipping past, and they were being robbed of their tribute. They claimed the redress of the pinchings of the forty years in the wilderness. They claimed the capitalisation and handing over to Scotland of her own money. They claimed justice for Scotland.

THE PRE-RAPHAELITE BROTHERHOOD.

A LECTURE was given on Saturday by Mr. J. E. Phythian, at the Mappin Art Gallery, Sheffield, concerning "Holman Hunt and the Pre-Raphaelite Brotherhood." He remarked at the outset that his object was in one sense to bring before the people Holman Hunt's book called "Pre-Raphaelitism and the Pre-Raphaelite Brotherhood," which was really Hunt's autobiography, with what he had to say about the Brotherhood. There was, of course, a great deal in the book of a purely technical character, but there was something of interest in it, too, more than that which appealed to the art lover alone, as they might readily appreciate when they considered the individuality, the honest English bull-dog qualities of the man. English art, the lecturer pointed out, had so much degenerated from the days of Hogarth, Reynolds, Gainsborough and others, that Constable was constrained to prophesy that in thirty years it would have ceased to exist; he thought it would be smothered under the load of tradition that he saw gradually encumbering it. The prophecy did not come true, but that there was some justification for it was shown by the fact that just at the time when it ought to have come true the pre-Raphaelite movement was begun in order that art might be vivified. "With some remarkable exceptions," said Hunt in his book, "art in our youth had become puerile and doting and it was high time to find a remedy. It stirred us to proclaim that art should interpret to men how much more beautiful the world is, not only in every natural form, but in every pure principle of human life, than they would without her aid deem it to be. If artists' work misguides men, making them believe that there is no order in creation, no wisdom in evolution, decrying the sublime influences as purposeless, we shall indeed be a sorry brood of men." This quotation set forth the two aims that characterised the work of Holman Hunt, Millais, Rossetti and other members of the Brotherhood—beautiful and wholesome guides for life. The Brotherhood did not purpose slavishly to imitate the work of the painters before the time of Raphael, but they returned to Nature and departed from convention and tradition. They went into the open and painted the natural truth they saw around them. They insisted upon following their own light and refused, to quote Russell Lowell's phrase, merely to be grave copiers of copies. In illustration of the passing from the artificial to the real, Mr. Phythian quoted an extract from a contribution by a French critic to one of the modern art magazines, in which he pointed out how the gestures of the post-Raphaelite paintings always seemed to be executed by an actor, whereas in the works of the painters of the fourteenth and fifteenth centuries the gestures appeared natural and unconscious, "and one should be really grateful to the English school for having proclaimed the grandeur and the puissant simplicity of Pre-Raphaelites." The Brotherhood was formed towards the end of 1848, and in the exhibition of 1849 the pictures they exhibited were favourably received, but in the following year, when the meaning of the mystic letters "P.R.B." that they attached to their signatures had been found out, and it was seen that they were revolting against authority, they were furiously attacked, both verbally and in the Press. As a specimen of the criticism to which they were subjected, the lecturer quoted the characteristically forceful and racy denunciation in "Household Words" by Charles Dickens of Holman Hunt's daringly realistic picture of the child Christ in the carpenter's home. The same mordant criticism broke out in the following year,

but then Ruskin, with all the weight of his authority and judgment, came to their assistance, writing a notable letter, in which he maintained that their work, which had been said to be false, was truest of the true, and that of the accepted Academicians to be really the false and meretricious work. Ruskin's advocacy brought the Press and the public very largely over to the side of the Pre-Raphaelites, and the victory of originality and truth to Nature was virtually won.

THE IDEAL IN ART.

A LECTURE was delivered in the Hibernian Academy by Mr. W. B. Yeats on "The Ideal in Art." The title of the lecture, he said, was not his, as he thought it detestable, but Mr. Hugh Lane's. Art was simply the pursuit of the one central reality of them all, the revelation and the discovery of themselves, the representation in picture, in poem, in music of themselves. He was going to try to apply to painting certain fundamental principles of art which he had found true of poetry. He was convinced that all the arts were fundamentally one art, and what was understood of one art was properly understood of every art. There were two kinds of artists, the one kind who were like some mysterious priesthood, living in the obscure depths of the temple carrying on the office of their religion for themselves and the other priests. And there was another order that spoke to the people, taking up the images that already lay in their minds, giving them additional beauty and additional power. It seemed to him that Watts was in all his allegorical works seeking vainly for some element that he, the great artist, had to share with the mass of the common people. He was as constant in the pursuit of the multitude for his noble ends as Tolstoi was. The greatest joy that ever came to the artist, the highest element in his creative joy, was to contemplate his own personality, enlarging and completing itself in the mirror of his paintings. Great art in the past had always two creators, the artist and the multitude. The multitude could not see nature raw. They had vague beliefs, and it was the artist that shaped these beliefs to high and personal beauty. Of all Watts's pictures he (the lecturer) most loved the "Genius of Greek Poetry." You could not in art do anything deliberately or consciously. Nature was the mother of the artist, and nature was very jealous. She demanded that you should permit her to do all. She was a great temptress, and out of her temptations had been created poetry, painting, sculpture, the glory of the world. To compensate for all that had been lost from the art world of the past they had gained a more intense sense of the personal reality of the individual temperament than it ever possessed before. In Ireland they had myths and beliefs among the people as in the Middle Ages, and if Watts had been an Irishman he probably would not have painted these allegories of his, but would celebrate instead the national legends and the national heroes. In the last year of his life Watts got some books of Irish legends into his possession, and he said of them that they were the books of the year, the great literary sensation of the last year of his life. That enthusiasm was really expressing his desire for a means of communicating with the multitude.

THE OLD BRIDGE, AYR.

AS a result of a conference between representatives of the Ayr Town Council with Mr. J. A. Morris, architect, and others who have an interest in the preservation of the Auld Brig, the following arrangements have been approved:—

1. Mr. Oswald is, as soon as possible after the general election is over, to convene a public meeting in Ayr, when resolutions will be submitted and a committee appointed to take all steps considered expedient to obtain subscriptions for executing the works necessary for the preservation of the bridge.

2. Should the committee, not later than August 1 next, succeed in raising the funds required for the work (which it is presently assumed may cost about 10,000*l.*) the Town Council will allow the committee to carry out the necessary preservative works on the bridge, at the sight and to the satisfaction of an engineer of eminence to be selected by the committee.

3. The work will be proceeded with without delay so soon as the necessary funds are raised, and the whole work is to be finished not later than August 1, 1908, when, or at the completion of the work if of earlier date, the committee will cease to have any further connection with the bridge, the Town Council thereafter resuming full control over it.

4. Should the committee find it necessary to rebuild any portion of the bridge, they shall submit plans and specifications of same to the Town Council, along with offers for the execution of the work, and if the Council approve of same, they will bear the cost of such rebuilding out of the Templeton bequest funds. Should the Town consider it necessary that a temporary wooden bridge be erected while the structure is being repaired or rebuilt, they shall be at the expense of erecting and maintaining it.

5. Such portion of the Templeton funds as meantime may not be required for such partial rebuilding of the bridge shall be held by the Town Council in terms of the bequest to them, subject to such alterations thereon as they may from time to time obtain legal sanction to make.

6. The plans and specifications of the whole works to be executed by the committee shall be submitted to the burgh surveyor, that he may assure the Town Council that the proposed works will make the bridge secure for public traffic for the future, and until this assurance is given the work shall not be proceeded with. The surveyor shall not be entitled to object to the said plans and specifications on any ground other than the safety of the public.

7. The committee before proceeding with the work shall, so far as necessary, apply to the Harbour Trust, the Board of Trade and the Dean of Guild Court and all others whose interests may be affected, for any warrants or authority that may be required, and for these purposes they may use the name of the provost, magistrates and councillors of the burgh.

8. Should the committee fail to raise subscriptions, or damage or destroy the bridge during preservative or rebuilding operations, no liability of any kind is to rest upon them in respect of such damage or destruction.

TAYLOR ART COMPETITION.

BY the will of the late Captain George Archibald Taylor the trustees and the Royal Dublin Society are entrusted with a fund for encouraging art in Ireland, and competitions for scholarships and prizes are held annually in Dublin in the month of March. The competitions are open to all students of art not exceeding twenty-five years of age, who shall have attended for twelve months at least a school of art in Ireland, or who, being of Irish birth, shall have attended for the like period a school of art in Great Britain or elsewhere, and who shall produce at the exhibition hereinafter mentioned a work or works of art displaying sufficient merit or a fair promise of future excellence. The competition this year will be held on March 19, when the sum of 110*l.* will be offered in a scholarship of 50*l.* and two prizes of 35*l.* and 5*l.* respectively, in classes 1 and 2, and a prize of 10*l.* in class 3, for water-colours; also a special prize of 10*l.* for an optional work in class 4.

The following are the arrangements for the coming competitions. Candidates for the scholarship and prizes must submit for examination a work in one of the following classes:—

Class 1. For Painters—A composition or subject picture in oil or water-colour, size not larger than 36 by 28, and not smaller than 24 by 16 inches. Subjects—(a). For figure painters—"The Toilet." (b) For landscape painters—"A Windy Day."

Class 2. For Modellers—A statuette not exceeding 36 inches in extreme height. Subject—"A Dancer," also a study of a head life-size in basso-relievo. These models must be cast in plaster-of-Paris.

Class 3. Water-Colours—A prize not exceeding 10*l.* is offered for a work in water-colour. Subjects—(*a*) landscape—"A Garden at Evening;" (*b*) figure painters—"A Serenade." The work must not be larger than 24 by 30 inches and not smaller than 18 by 24 inches.

Class 4. Optional Work—A special prize not exceeding 10*l.* is also offered for competition, the selection of the subject in art being left entirely open to the competitor.

The necessary form of declaration and certificate may be obtained on application to the Registrar, Royal Dublin Society, Leinster House, Dublin.

Works for competition must not be framed nor bear the student's name, and must arrive at Leinster House not later than five o'clock P.M. on Saturday, March 17, 1906.

NOTES AND COMMENTS.

IT has been generally supposed that the credit for the design of the Thames Embankment is to be awarded to the late Sir J. W. BAZALGETTE, who was the chief engineer to the Metropolitan Board of Works. He piloted the Bill authorising the construction through Parliament, the plans were prepared and the works carried out under his general direction. It is now claimed for the late Mr. FRANCIS WEBB WENTWORTH-SHIELDS, who died on the 18th ult., that it was his plan that was recommended by the Royal Commission. Schemes for an embankment were proposed from the time of the Great Fire, and there must necessarily have been more or less resemblance between them all. Mr. SHIELDS had, however, other claims for notice. He assisted Sir GILBERT SCOTT in preparing plans for the engineering construction of the Albert Memorial, to which the architectural and sculptural work serves as a veil. He was also the author of the small book, "Strains in Ironwork," which after its publication was to be found in every engineer's office in Westminster. Mr. SHIELDS was an Irishman, and born in 1820; he served as pupil of CHARLES VIGNOLES. In 1843 he went to Sydney as city surveyor. While there he prepared plans for the first Australian railway. On his return he was appointed resident engineer for the works at the Crystal Palace at Sydenham. As a consulting engineer he was largely employed.

ALTHOUGH more than two thousand years have elapsed since EUCLID informed the Egyptian monarch that there was no royal road to geometry, and that the study of his "elements" was indispensable, it is remarkable that men are still divided in opinion about the utility of his work. When they were prepared the propositions and problems were not supposed to have practical applications of the kind which geometry is now made to subserve. Yet the use of them is imperative in the examinations for membership of societies which claim to be practical. It was not until last July that the Law Society removed from their regulations the words "No proof can be accepted which violates EUCLID's order," and substituted the words "Proofs other than EUCLID's will be accepted." In November last the Surveyors' Institution decided to allow candidates the choice of EUCLID or geometry. These changes have been due to the remonstrances of the Mathematical Association. But various other members of society consider that EUCLID's "elements" have not the value which was accorded during many centuries. They were thought to afford a training in reasoning. But the time has passed for such roundabout methods of arriving at conclusions as are taught. In the examinations of the Royal Institute of British Architects a knowledge of the first two books of EUCLID is expected. But the Mathematical Association was not apparently troubled by the consequences of architects following old-fashioned methods.

IT has often been decided that when a local authority requires a house for the purpose of widening a street, and gives notice to treat under MICHAEL ANGELO TAYLOR'S Act, they cannot take part of the house if, by taking a part, the identity of the house as a house is destroyed (*The Architect*, November 17, 1905, p. 305). In the case of THOMPSON & JACKSON *v.* Mayor of Hammersmith this principle was applied to the case where the lessees of the house required had covenanted to make extensive structural alterations in the house. It was contended that, under these circumstances, the house could be reconstructed so as to be capable of use as a house after a part only of it had been taken. BUCKLEY, J., held that the plaintiffs had an interest in the house in the condition it was in when it was leased to them; and that, though it might be possible to reconstruct the building after the defendants had taken the portion they required, the reconstructed building would not be a building of the same character as it would have been with this portion. If this decision is right it would seem that the question whether a local authority can take only a part of a house depends not upon the question whether the identity of the house as *a* house is destroyed, but upon the question whether the identity of the house as *the* house, *i.e.* such as it was before the alteration, is destroyed.

THE notice to artists for the Royal Academy Exhibition has been issued. Water-colours, miniatures, black-and-white drawings, engravings, etchings, architectural drawings, and all other works under glass are to be delivered on Friday, March 30; oil paintings on Saturday, March 31, and Monday, April 2; and sculpture on Tuesday, April 3. No work will in any circumstances be received before or after these specified dates. All works must be delivered at Burlington Gardens entrance between 7 A.M. and 10 P.M. Last year it was stated that members of the Academy could send six works and non-members three. This year the announcement is: "No artist is allowed to send or exhibit more than three different works." The other regulations are unchanged.

ILLUSTRATIONS.

NORTHERN BANKING COMPANY'S OFFICES, GRAFTON STREET, DUBLIN.

THE façade of the new building erected for the Northern Banking Company in Grafton Street, Dublin, has a frontage of 63 feet. It is finished with polished red Swedish granite columns, its base and entrance door having Alloa granite and Swedish green columns; Dumfries red sandstone is used for the first storey, with channelled joints, the remaining storeys being faced with Doulting stone from the Somerset quarries. The caps of the Corinthian columns are of Portland stone. Ample strong-room accommodation is provided in the basement, where a residence has been set apart for the porter. The strong-room work was executed by Messrs. CHATWOOD, LTD. The floor of the public office is laid with marble mosaic, and the dado, which is about 3 feet 6 inches high, is of polished granite and marble. The shafts of the four Corinthian columns supporting the roof are of red scagliola. The walls above the dado are faced with Dumfries stone to a height of 10 feet 6 inches. The office is effectively lighted by means of a stained-glass lantern light and a large three-light window at the western extremity, bearing the arms of Belfast, Dublin, Londonderry, and Newry. The ceiling of the office is circular, and is divided into bays and panels with enriched and moulded ribs, the panels being filled in with pateræ. The manager's private residence is in the front of the building, over the entrance. There are offices to let in other portions of the building, approached by wide stone stairs and an electric lift, which travels between the basement and the upper storeys. The building is lighted by electricity throughout. The contractors were Messrs. H. LAVERTY & SONS, LTD., Belfast; Mr. W. H. LYNN, R.H.A., being the architect.

HOUSE NEAR CAMBRIDGE.—DRAWING-ROOM.—THE HALL.

THIS house has been erected on the St. John's College estate, near Cambridge, for Mr. F. R. COWPER REED, and is built in 14-inch red brickwork up to the first floor, and timberwork and rough-cast plaster over brickwork above, with red brick projecting chimneys. The hall, dining-room and drawing-room, illustrations of which are given, communicate with each other by folding doors, giving a reception-room of some 80 feet in length. The whole of the work, including the internal fittings and mantels, which are of oak, has been carried out by Messrs. HINNELS & SON, from the designs of Mr. H. STEWARD WATLING, F.S.A., of Dovercourt and Ipswich.

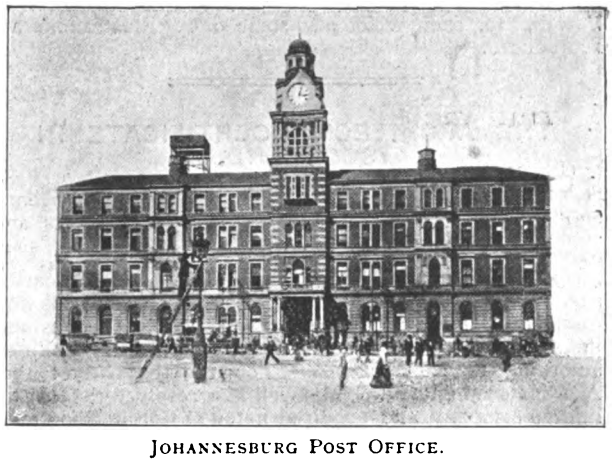
THE COLONIES AND COLONIAL ARCHITECTURE.

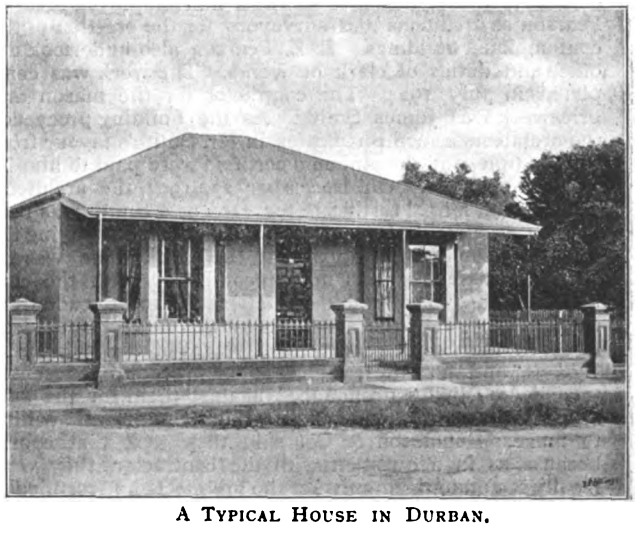
(*Concluded from page* 50.)



THE ORANGE RIVER COLONY.

BLOEMFONTEIN, the capital of the colony, is regularly laid out, with a market square in the centre. The Raadzaal is a tastefully designed building which cost nearly 60,000*l.* It is surrounded by Ionic columns, and has a tower surmounted by a dome some 90 feet high. Other notable buildings are the old Raadzaal, the post office, the town hall, the museum and Grey's college. The Dutch Reformed Church, with its twin spires, forms a conspicuous feature, whilst among other places of worship are the Roman Catholic Church and Convent, and the cathedral of St. Andrew and St. Michael, with the bishop's lodge adjoining.

At Heilbron there are a Court House, post office and town hall, as well as two hotels. Brandfort can boast of its Dutch Reformed Church, which is considered a really fine structure. At Harrismith there is also a handsome Dutch Reformed Church, besides a commodious town hall.



TOWN HALL, QUEENSTOWN, CAPE COLONY.

JOHANNESBURG POST OFFICE.

THE RAADZAAL, BLOEMFONTEIN.

A TYPICAL HOUSE IN DURBAN.

THE TRANSVAAL.

An exceptional field has of late years been offered here for architectural activity, and the transformation which has taken place at Johannesburg is of a remarkable character. The most noteworthy public buildings are the public library and the General Post Office. The façade of the latter is 200 feet long, and the building is surmounted by a tower 130 feet high, the main hall being 120 feet long by 38 feet wide. The Stock Exchange, in Marshall Square, is also a costly building. As a commercial and industrial city it takes pride in such buildings as the Corner House and the National Bank, the Carlton Hotel, the Consolidated Investment buildings, the National Mutual Life Association of Australia's offices and many others.

At Pretoria are blocks of buildings which were erected under the former Government. The former Raadzaal, or Government buildings, and the Palace of Justice are the architectural glories of the place. The former was designed by Mr. Wierda, and cost 138,000*l.* It practically fills one side of Church Square, where are situated several other buildings.

At Klerksdorp also there are several fine buildings, notably the Government buildings, with a good portico. The hospital, the largest in the Western Transvaal, is considered to be an up-to-date building, and the town boasts of several good hotels.

NATAL.

This colony, as is well known, derives its name from the fact of its discovery by the celebrated Portuguese navigator, Vasco da Gama, on Christmas Day 1497, an achievement commemorated by a drinking fountain and clock erected at Durban, which town was founded in 1835 and named after Sir Benjamin d'Urban, at that time Governor of the Cape. The new municipal buildings here, around which architectural interest is principally centred, are estimated to cost 320,000*l.*, the architects being Messrs. Scott & Hudson. The original town hall, taken over by the Government for post and telegraph purposes, was finished in 1885, and cost over 50,000*l.*, the clock tower being 164 feet high. The large market house cost 35,000*l.*, and there is also a drill hall which is considered a fine building. The Durban Club, too, possesses suitable quarters, erected at a cost of over 50,000*l.* The baths, library, museum and the art gallery, moreover, add to the convenience and attractiveness of the town. In catering for the general traffic with their own people and with the interior colonies, the merchants of Durban have been compelled, we gather from the *British and South African Export Gazette*, to enlarge their structural accommodation to an extent unforeseen a few years ago, and with the aid of local architects they have contrived to do so in most cases with highly ornamental

Digitized by Google

and artistic results. Eloquent testimony is afforded of the advance which is being made architecturally, while the desire for handsome and commodious public buildings is no less emphatically marked throughout the colony.

At Pietermaritzburg, so named after the leaders of the Dutch voortrekkers, Pieter Retief and Gert Maritz, the principal buildings are the town hall, which cost about 80,000*l.*, the Legislative Assembly Buildings, the Legislative Council Chambers, the Colonial Offices, the post office and the new railway station. The city, moreover, contains some statues and a number of institutions, churches, schools, &c.

In conclusion, we may add that the celebration of the centenary of the establishment of British rule in the Cape Colony is an opportune moment for devoting a little space to the subject of South Africa, for it was on January 5, 1806, that the British troops under Sir David Baird landed at Table Bay, and after defeating the Dutch garrison, secured the capitulation, which was ratified on January 19.

For some of our information we are indebted, besides the source previously mentioned, to the official guide book, "How to see South Africa," published by Gilchrist & Powell, Ltd., from which also some of our illustrations are reproduced.

THE ARCHITECT'S CERTIFICATE IN SCOTLAND.

JUDGMENT was given in cross actions between A. Donaldson & Co., Ltd., motor-car repairers and agents, Edinburgh, and J. R. & E. E. Pearson, architects and surveyors, Edinburgh, and others. Donaldson & Co. sued for 128*l.* 10*s.*, and in the counter-action Messrs. Pearson sued for 52*l.* 12*s.* The firm of J. R. & E. E. Pearson is now dissolved, but Mr. E. E. Pearson carries on the business under the firm name, and has taken over its liabilities, according to the *Scotsman*. Towards the end of 1903 A. Donaldson and W. G. Maxwell had resolved to form the limited company, and acquired a feu at Gorgie Road upon which to erect buildings for the carrying on of the company's business. The limited company was incorporated on February 2, 1904, with a capital of 3,000*l.* Prior to that date Messrs. Donaldson & Maxwell had employed Messrs. Pearson as architects and surveyors for the erection of the contemplated buildings. E. E. Pearson also undertook the office and duties of clerk of works. The work was completed in July 1904. The contractor for the mason and brickwork was James Smith. As the building proceeded the architects issued certificates in Mr. Smith's favour from time to time, and the amounts certified were paid to him by Donaldson & Co. On December 23, 1904, the architects granted him a final certificate for 240*l.* 9*s.* Smith was paid 100*l.* on account, but Donaldson & Co. demurred to paying the balance upon the grounds that the work done was in certain material respects not in conformity with the contract, and that considerable deductions fell to be made from the architect's measurements. Smith then sued Donaldson & Co. in the Sheriff Court for payment of the balance of 140*l.* 9*s.*, and the latter, after sundry procedure, consented to a decree being pronounced against them for the sum sued for, under deduction of 10*l.* which Smith was willing to make. Donaldson & Co. said they took that course because, as in a question with the contractor, they were legally bound to pay him what the architects had certified as being due to him "on account of work executed and materials supplied" under the contract. They then sued the architects for damages, the damages being, as they contended, measured by so much of the 130*l.* 9*s.* paid by them to Smith as was paid in respect of work not in the contract, but passed by the architects, or of any wrong measurements by the latter. The architects denied liability, and in the counter-action they sued Donaldson & Co. for 40*l.*, balance of commission alleged to be due; 10*l.* 10*s.* for preparing a second set of plans, and 2*l.* 2*s.* for revising and examining the feu charter or lease.

Lord Dundas found that in respect of the matters set forth in the action at the instance of A. Donaldson & Co. the pursuers or plaintiffs were entitled to decree for 72*l.* 5*s.* 1*d.*; that in respect of the matters set forth in the cross action by the Messrs. Pearson, the pursuers were entitled to decree for 40*l.*, and that the difference between these sums amounted to 32*l.* 5*s.* 1*d.* Therefore, in the conjoined action his Lordship decided against the Messrs. Pearson, who are to pay to A. Donaldson & Co. 32*l.* 5*s.* 1*d.*, and found no expenses due to or by either party. His Lordship said he was unable to accept the contention of the Messrs. Pearson that Donaldson & Co. need not and ought not to have paid Smith, but that, having done so, they were barred from suing the architects. He thought that an architect's duty in an ordinary case like the present was to give such supervision as would reasonably enable him to certify that the contractor's work had been executed in conformity with the contract, and that he would be liable to his employer on account of work certified by him, but which was in fact disconform to contract, and which proper supervision would have enabled him to detect and to reject. It might be that he had recourse against the contractors. It might also be that in such circumstances the employer might elect to sue the contractor and not the architect. But his Lordship thought that a contractor who had obtained a final certificate from the architect for work ostensibly done in conformity with the contract had a good claim against the employer for payment of the certified amount, or at all events, one which the employer was warranted in complying with whatever rights of relief might exist as among the various parties concerned. It appeared to him therefore that Donaldson & Co. were well advised in submitting to Smith's demand, and that their payment was not a voluntary one, but one in fulfilment of, at all events, a *prima facie* legal obligation.

RIVAL EDUCATIONAL SYSTEMS IN AMERICA.

"AN architect in America," it has been said, "is simply a draughtsman who has landed a job." If this be true, says the *New York Evening Post*, the problem of architectural education is simply that of doing the best one can by draughtsmen. It was in this belief that the Society of Beaux-Arts Architects some years ago opened classes in draughtsmanship and elementary design, admitting all comers, and following the method of competitive instruction which they themselves had learned at the great French school. The success of the transplanted system has been surprising. From the New York classes have come not only architectural draughtsmen of high quality, but also graduates who might claim the title of architect by a better right than the definition just quoted. In fact, the Paris prizeman of the new school receives the signal privilege of admission without examination at the mother school in Paris.

Inspired by their great success, the Society of Beaux-Arts Architects now makes the rather startling proposal that its classes should be recognised and supported by all the architectural schools in the country. This means more than the general acceptance of the Paris method; it involves the turning over of all practical instruction in architecture to a central school in New York, the outlying faculties retaining only their courses in mathematics, engineering, art history, and, in general, the bookish subjects subsidiary to the main study of design. It requires, withal, that these established institutions shall make generous contribution of their funds to a new school to be developed from that so successfully conducted by the Beaux-Arts Architects. Naturally, a summons to partial hara-kiri—or better, to radical self-amputation—has not been obeyed cheerfully by the elected victims.

But we have to do, after all, rather with a matter of principle than of politeness. If our traditional schools of architecture are so bad as they are said to be, they must soon shrink to their professors and stipendiaries; if the Beaux-Arts training is the most excellent, it must prevail. All must admit that the plan of the Beaux-Arts Architects is thoroughly serious, and cannot safely be laughed down. For a generation and more Americans have brought back the training of the Paris *ateliers*, whose former students include, with few exceptions, the ablest of the younger architects. Moreover, the Ecole des Beaux-Arts has at least worked out a system thoroughly practical and generally influential. A stroll in any of our cities, or a glance at an album of Buenos Ayres, will equally give evidence of the pervasiveness of the Ecole. One might go further, and say that this system is not only the best, but that it is perhaps the only one that deserves a title implying doctrine and co-ordination.

Since the really simple methods of France are obscured by the jargon of graduates, a word of explanation may not be amiss. The instruction is, first of all, competitive; all the students of any grade work upon the same programmes and under identical limitations of time. The conditions for the imaginary buildings planned and designed by the students are, as near as may be, those of actual practice

Digitized by Google

For example, no student is told to design a porter's lodge, but one with stipulated accommodations, fixed entrances, upon land of a certain lie, in connection with a mansion of a certain style. Promotion depends upon achieving a satisfactory rank in a determined number of these competitions, and the aspirant not merely gains the advantage of superior criticisms of his own design, but profits even more by studying in the periodical exhibitions the solutions of the problem offered by his fellows. Awards of excellence are based largely on merit of plan, upon design in relation thereto, and strict conformity to the programme is required. No attention is paid to prettiness of rendering, and rather little regard is given to novel or ingenious handling of ornamentation. The eminently practical nature of the plan explains at once its attractiveness to American students and their success when once they have passed the rigorous barriers of the Ecole. It is this system that its former pupils have transported to New York, and wish to establish universally.

The scheme, in general, contemplates a central school, superseding that of the Society of Beaux-Arts Architects, managed and supported jointly by the architectural schools of the country. This central body would fix the programmes for the entire federation, and would judge the drawings wherever made. It would thus control the practical instruction in designing, and draughting-rooms outside of New York, whether in university departments or elsewhere, would virtually become branches of the central school. Reciprocally, the existing architectural schools would be asked to open their archæological and scientific courses to members of the classes in design, and to grant them diplomas upon examination. Such in brief is the project.

Its accomplishment must probably await a better understanding between the Beaux-Arts Architects and the faculties and alumni of our university schools of architecture. The archæologising tendency in the university schools, which is unaffectedly scorned by the Paris contingent, is a necessary condition. In the absence of great monuments we cannot count upon the student inhaling tradition and inspiration with the air he breathes, and must fall back upon the admittedly poor substitute of books and photographs. On the other hand, our architectural faculties have been by no means proof against academic mildew, and have been too slow to recognise the advantages offered by the training of the Ecole. Some kind of reconciliation between the two is evidently desirable.

The classes of the Society of Beaux-Arts Architects were established with the very practical end of supplying trained draughtsmen, and the hope of turning out architects also. For this reason the courses were open to all, without examination or other restriction. It is difficult to see how federation can be made with schools requiring for admission examinations or a college degree. It is probably true that any school of applied art must languish in academic surroundings. Architecture has fared only a shade better under such conditions than "Practical Politics," which was for a time assiduously cultivated at the University of Chicago. Hence a strong architectural school, managed by practising architects, and free from university entanglements, would be welcome. But, frankly, we do not see how the Society of Beaux-Arts Architects can expect much aid from the universities in founding such a school. An increasing interchange of courtesies between the more enterprising architectural schools and the New York *ateliers* there may undoubtedly be. To expect more in the near future requires a somewhat unrestrained enthusiasm.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

AT the rooms of the above Society, on Thursday the 25th ult., Mr. A. Needham Wilson read a paper on "The Architecture of Southern France." Mr. H. S. Chorley was in the chair. The lecturer said :—"I propose to deal with the influences which governed the production and development of architecture after the withdrawal of Roman domination in the south of France, and particularly Provence. A student visiting the south of France for the first time cannot fail to be struck by the examples of Romanesque architecture more than by anything else, and in Provence he will be bewildered by the impression that no intermediate styles seem to bridge the gap between the degenerate Romanesque and the Late Gothic, or even the Renaissance. To deal with the subject as a whole would hardly come within the scope of a single paper, and with your permission I will deal in particular with the Romanesque in Provence. May I be pardoned if I dip briefly into history? but a rough outline is necessary on which to base the other aspects of the subject." The lecturer then dealt with the occupation of Provence by the Romans, the influence of the Franks, and the rapid advancement of learning and arts under the Emperor Charlemagne, and the permanent state of civil war. "There remains the ecclesiastical aspect. I will not stay to dwell upon the part that Arles has played in the history of the Church, on Constantine, or on the Church Councils; rather let me emphasise the noble part played by the Church during the horrible centuries which preceded the Renaissance of the eleventh century. Having now sketched the conditions and influences under which these isolated religious communities existed, we must glance at the architecture which they produced. As Viollet le Duc says, the 'fragments of architecture which remain to us of the sixth and seventh centuries are but pale reflections of the Roman art, often of débris thrown together haphazard by unskilful workmen executing masonry and brickwork with much difficulty.' In Provence as well as in its vicinity many buildings appear to incorporate Roman fragments; we are told that these are slavish copies, but it would be wrong to jump to too hasty a conclusion on the point. There are some typical examples, as the porches at Notre Dame, at Avignon, and at Aix en Provence, which appear to bear the stamp of Roman work, but a little consideration will tell us that they are but slavish copies; but coming nearer we find a delicacy of execution which seems to indicate that they are either genuine Roman fragments or copies by craftsmen who were certainly not ignorant of traditional training; also the positions occupied by these fragments frequently indicate an incongruity of treatment quite incompatible with original work. One of the first problems which confronted the Provençals was the covering of their buildings. The country produced no suitable timber, but stone in plenty. The school of Provence contented itself with the simple pointed barrel vault over narrow low naves only, trusting to the massiveness of the walls to resist the thrust, or, where aisles were adopted, formed a kind of continuous flying buttress, and raising the wall over the arcades sufficiently to be pierced with windows." The lecture was illustrated by numerous sketches. Mr. Butler Wilson, in proposing a vote of thanks to the lecturer, said that he noted with pleasure the individuality of the architecture of Provence, and the way they had overcome the difficulties by purely local materials. Mr. A. E. Kirk seconded, and Messrs. Chorley and Hope supported the resolution, which was carried.

GLASGOW FINE ARTS INSTITUTE.

THE annual report of the Royal Glasgow Institute of the Fine Arts states that during the past year, a period which embraced the first complete year's working in the present galleries, a deficit of 75*l.* 12*s.* 9*d.* had been incurred. This was due to a considerable portion of some unusual but necessary expenditure, largely on work of a permanent character, being defrayed out of revenue instead of being charged to capital or carried to suspense account. The Council, however, were convinced that the immediate prospects of the Institute were altogether favourable, and, in the possession of that knowledge, had voted the sum of 100*l.* to assist in the purchase of sculpture supplementary to the two amounts of 300*l.* each allocated for that purpose by the Corporation and an anonymous donor. The cost of the exhibition was considerably less than the preceding year, but there was an increase in the ordinary regular expenditure. This was difficult to avoid, having regard to the extended character of the work which required to be undertaken in connection with the more spacious premises now at the Council's disposal and the larger enterprises which the new venture had demanded. There had been an increase in the membership, thirteen new subscribers having been enrolled during the past year. The report was adopted. The chairman, Mr. Simons, proposed the re-election of Sir John Stirling-Maxwell as chairman. Messrs. J. G. A. A. Baird, J. Parker Smith, Hugh Brown and Joseph Henderson were elected vice-presidents. Lord Provost Bilsland proposed the re-election of Mr. Simons as chairman of the Council for the ensuing year. Mr. Simons said that there were reasons, not personal to himself, which made him decline to be re-nominated. There were things in connection with the Institute which might not and could not be done with

Digitized by Google

impunity. The Lord Provost and Mr. Kay expressed surprise at Mr. Simon's decision, and the latter said he thought any feeling that there might be underground currents at work ought to be removed from Mr. Simon's mind. Mr. Simons ultimately agreed to accept office until a successor could be found. Messrs. Arthur Kay and William Greig were re-elected hon. treasurer and hon. secretary respectively, and the following were elected members of the Council:—Messrs. James Morris Henderson, J. G. Laing, J. M. Crawford and W. Gibson.

CRACKS ON CONCRETE SURFACES.

THE appearance of hair cracks on a concrete surface is a disfigurement, the cause and remedy for which have not received the proper study that so important a subject justifies. The cause of this trouble has been investigated from time to time, but heretofore the conclusions drawn have been very incomplete.

Hair cracks, being entirely on the surface, says Mr. Albert Moyer in the *Engineering Record*, do not indicate a weakness in the concrete; in most instances they are not greater in depth or width than that of a coarse hair. A rough-surface concrete does not display these objectionable features to as great an extent as does an even-trowled face, on which surface they are very apparent, especially in damp or wet weather. Often these cracks do not appear for several weeks or months after the concrete has set hard.

A practical worker in concrete is not as much concerned with the cause of hair cracks and crazing as he is interested in their effect and remedy. It often requires investigation as to cause to arrive at a correct solution of the trouble, and thus apply permanent remedy, otherwise we would be simply dealing with symptoms. Research conducted along theoretical lines seldom brings practical results, therefore the writer will endeavour to eliminate theory as far as possible. His investigation has been founded on the reverse practice—that of noting and observing very carefully the practical results both as to effect and remedy, and then endeavouring to explain these conclusions by theory.

It has been known for some time that very wet concrete s more apt to craze and show these undesirable hair cracks than dry concrete. Dry concrete is objectionable from the standpoint of strength and density, and therefore its use cannot be advocated simply because hair cracks are to some extent avoided. Investigation and practical demonstration leave no doubt of the fact that in wet concrete a portion of the flour or very finest particles of the cement is carried to the surface by the action of the excess water which is being absorbed by the atmosphere. This excess water is to a great extent drawn from the interior of the stone to the exterior, carrying with it the finer particles which, being deposited on the surface, form a richer mortar than is contained in the body of the concrete. Under certain conditions these fine particles deposited on the surface practically form a coating of neat cement.

Neat cement or the richer mortars are found to be much more liable to crazing than mortars containing a larger proportion of sand or finely crushed stone. This is particularly true in the manufacture of cement stone by the use of sand moulds in which the mixture is poured very wet. It has also been noted that, when the stone is properly seasoned by keeping the surface covered with a thick layer of very wet sand, or when the stone is immersed entirely and for some time in water, the trouble has been overcome almost entirely. These hair or map cracks would be entirely eliminated for all time if the stone were immersed in water for a sufficient period to allow the complete crystallisation of the cement. This, however, is not always permitted by convenience or economy.

The crazing of neat cement is apparent in test pats for laboratory purposes, when these pats are exposed and allowed to set and harden in air, but if they are protected in a moist closet and afterward immersed in water for a period of at least twenty-eight days, no hair cracks or crazing will result.

A careful examination of these cracks led to the conclusion that they are due entirely to a contraction of the surface, the same contraction not taking place in the body of the concrete.

Experiments made by Professor Swain and Professor Bauschinger demonstrate that neat cement contracts when set and hardened in air. This applies to all brands of high-grade Portland cement. Further tests demonstrate that this contraction increases with age up to a certain period. The same authorities demonstrate that a mortar made of one part Portland cement and three parts sand, hardened in air, shows contraction, but less in proportion than the neat cement. It is obvious that this bears out the practical investigations regarding concrete and cement stone which have been described above; that is, hair cracks are due to contraction of the surface, and that this contraction is due to the fact that the concrete has been hardened in air.

The following results were obtained by investigations made by the same authorities and others showing the effects of neat cement and mortar when hardened under water. The test pats or cubes of neat cement and mortar, after the final set, were immersed and kept under water for a considerable period of time. The results prove that neat cement when hardened under water shows a slight expansion, while mortar composed of one part Portland cement and three parts sand shows an expansion, but less in proportion than the neat cement.

Reducing these conclusions to figures and taking the average results obtained by various authorities, figuring the expansion and contraction in percentage, the writer finds the following results:—

Neat Portland cement hardened in air at the end of sixteen weeks shows a 0.15 per cent. contraction.

One to three mortar hardened in air at the end of sixteen weeks shows a 0.05 per cent. contraction.

Neat Portland cement hardened under water at the end of sixteen weeks shows an expansion of 0.05 per cent.

One to three mortar hardened under water at the end of sixteen weeks shows an expansion of 0.015 per cent.

Without going further into the matter of figures it is safe to state that the expansion and contraction is for less shorter periods than sixteen weeks and that the percentage will be a trifle greater if carried beyond sixteen weeks or up to six months or a year.

We can, therefore, conclude that in a rich mortar there is more neat Portland cement on the face, and, therefore, a greater percentage of contraction of the surface; also that a less rich mortar will show a proportionately less percentage of contraction, and that if the concrete were kept wet and protected (which is equivalent to hardening under water), hair cracks and crazing would be avoided.

In the past this trouble has been partially overcome by brushing off the surface of the concrete or cement stone with a stiff steel brush or by scrubbing the surface with a cement brick and wet sand, thus partially removing what might be termed a neat cement face. It has been found, however, that this does not entirely overcome the trouble, the remedy proving but temporary, the cracks appearing several months afterward. The brushing or scrubbing is merely an assistance; the real remedy lies in keeping the surface thoroughly and continuously wet as long as possible. It is unfortunate that this rule is seldom observed, and that in its non-observance good results are sometimes obtained. The worker in cement is thus influenced to disregard a matter of considerable importance in concrete construction. That good results are obtained from a disregard of these principles is largely a matter of luck. If the weather be damp for a number of days after the concrete has set, the object has been partially brought about by nature; then, again, the surface may have been so placed as to escape exposure from the wind or sun, which would tend to dry it, and was kept wet by the excess of water in the concrete. It is desirable to have the surface of the concrete or cement stone as near the same texture as the body of the concrete.

The only permanent remedy which will eliminate entirely these objectionable features is the removal of as much of this excess of neat cement collected on the surface as is possible as soon as the moulds are taken down. The surface should then be kept wet by the application of wet sand sprinkled from time to time with water, or hanging wet cloths over the perpendicular surfaces, keeping the exterior wet and the cloths wet by sprinkling or by any other method which will accomplish this result. The surface should be kept continuously wet for a sufficient length of time to enable the cement to attain ultimate crystallisation. By so doing the effect is practically the same as that of hardening under water. It is reasonable to conclude that if so treated the surface will slightly expand, but not to a greater extent than the body of the concrete which is already wet.

It is not amiss to bring this whole subject as prominently as possible before those having charge of concrete construction, endeavouring to impress upon them the necessity of keeping concrete protected and thoroughly and continuously wet for as long a period as economy will permit.

SHEFFIELD SOCIETY OF ARCHITECTS.

A PAPER was read before the Sheffield Society of Architects and Surveyors on "English Renaissance, 1650 to 1700," by Mr. C. F. Innocent. He first described the smaller Sheffield buildings of the period. He showed that they were still in their details Jacobean, with mullioned and transomed windows and label moulds and strings. It was only in a certain stiffness and formality in the arrangement of the parts that there was a difference from the work of the preceding period. Walkley Old Hall is an example. In remote districts, such as the Little Don Valley, Gothic details still lingered on, even until the early years of the eighteenth century. The porch of Midhope Church is an example of this. There is thus less than half a century in this district between the last of the Gothic work and the first building of the Gothic revival, which is Ravenfield Church, designed in 1756 by John Carr, of York. During this period English garden design attained its greatest perfection under the influence of the great French garden designer, Le Notre, and the period is interesting as being that of the transition from the formal to the landscape school of gardening. The walled-in gardens and courtyards of Eyam and Derwent Halls are examples of the earlier idea, while the spacious gardens at Sprotborough, though the original plan has been somewhat modified, still show with their terraces and "vistas" the influence of Le Notre. Sprotborough Hall was built in the reign of Charles II., and is a fine example of a house of the Restoration period. The great houses of the neighbourhood were naturally much purer in their style than the smaller, and Chatsworth House, designed by Talman, the rival of Wren, and the most important building erected in the neighbourhood during the period, is pure Renaissance, and exhibits no trace of Jacobean design. It is difficult to realise that Eyam Hall is only a few years earlier in date than Chatsworth, but such is the case. At the end of the seventeenth century the people of Sheffield indulged in a new town hall. The accounts have been preserved by the town trustees, and the cost of the building appears to have been about 300*l*. The hall stood at the church gates, across what is now the bottom of Church Street, and was pulled down a century ago. The doorway now preserved in Weston Park has been supposed, without any evidence, to have been the entrance of the hall. In the Sheffield district during this period the use of timberwork for outer walls was given up; and in the South, where good building stone was not so plentiful, great advances in the use of brickwork were made under the influence of Sir Christopher Wren, who was the great architect of the period, and who continued in the active practice of his art for sixty years.

NEWPORT BOROUGH ASYLUM.

THE new asylum which was opened by the Mayor of Newport on January 25 is situated at Caerleon on a pleasant site commanding good views of the surrounding country. The wards accommodate 368 patients, 184 of either sex, while the administrative offices are designed for 500, the number to be ultimately provided for.

The main building is arranged with the administrative offices placed centrally, and the patients' blocks, of which there are three for each sex, on either side.

The blocks for patients are two storeys in height, the ones nearest the centre being allotted to sick and infirm cases and consisting of a ward for thirty patients on each floor. The next block is designed for thirty-five epileptic and thirty-five quiet chronic cases, the epileptics being accommodated in a ward on the ground floor and the quiet chronics in a similar ward on the first floor. Next this is the recent and acute block, comprising a ward for twenty-seven patients on either floor.

The future extensions will consist of a block beyond the recent and acute on each side for working patients, that on the female side being contiguous to the laundry, and that on the male side adjacent to the workshops. The asylum is so designed that these additional blocks may be added without in any way disturbing the patients or interfering with the working of the institution.

The whole of the wards are entirely self-contained, and are planned with the special requirements needed for the respective classes of patients. The day-rooms have cheerful and uninterrupted outlooks, and they, together with the dormitories, are efficiently lighted and ventilated. The sanitary arrangements are placed in spurs at the backs of the wards, from which they are separated by cross-ventilated lobbies. Staircases of artificial stone are placed at the extreme end of each block, thus affording two means of exit from every portion of the wards.

The wards are designed on the continuous principle, which not only admits of economy in working, but is also the most convenient for supervision.

The official block is placed centrally to the south of the administrative offices. The great fall in the ground from back to front would not admit of this block being placed to the north, the position recommended by the Commissioners in Lunacy. It is a two-storey building containing on the ground floor committee-room, receiving-room, photographic studio, &c. The upper floor is allotted to the assistant medical officer and the matron, their quarters being quite separate and reached by different staircases.

Immediately at the rear of the official block are the visiting-rooms, chaplain's-room and dispensary.

The dining and recreation hall which is 74 feet long by 40 feet wide, and has a stage and dressing-rooms attached, is placed to the south of the kitchen offices. The hall is conveniently arranged for service from the kitchen and for entertaining purposes, and has separate entrances for males and females.

The kitchen offices comprise kitchen, scullery, vegetable scullery, larders, pantry, dairy, &c., with separate arrangements for serving to each side of the building.

To the north of the kitchen offices are the steward's stores. These contain the main store, bread-rooms, clerk's office and meat store. As in the kitchen, separate arrangements are provided for serving stores to each side of the building. The bakery is placed to the west of the steward's stores and in communication with same for the delivery of flour, &c.

The laundry, which is at the rear on the female side, consists of a general laundry, washhouse, drying-room, receiving and distributing rooms, and a foul linen washhouse with separate drying arrangements.

Adjacent to the laundry a workroom block is provided, containing on the ground floor a needlework room and matron's store, and on the upper floor bedrooms for the laundry maids.

On the male side, in close proximity to the site for the future block for working patients, are the workshops. They comprise shops for shoemakers, tailors, upholsterers, carpenters, plumbers, painters and glaziers, bricklayers' shed, foreman's office, &c.

The boiler-house block is placed to the east of the workshops, and contains, in addition to the boiler-house, coal stores, electric-plant room, battery-room, pump-room, engineer's shop, office, &c.

The blocks for attendants and nurses are placed in the usual position east and west of the administrative offices. They include the necessary mess and recreation-rooms on the ground-floor, the upper floor being allotted to night-nurses and domestics on the female side and to night attendants on the male side.

In addition to a bath in each ward, a general bathhouse is provided on either side with the necessary dressing-rooms, &c., attached.

The buildings are lighted throughout by electricity, the current being generated in the institution. A complete system of electric fire-alarms, tell-tales, bells and telephones is installed throughout the buildings.

The water is from the Corporation supply, storage cisterns being provided in each section of the building sufficient for one day's requirements.

In addition to the two means of exit provided from each ward previously mentioned, ample precautions have been taken in case of fire, both the interior and exterior of the building being commanded by hydrants of the latest type.

The water mains, electric cables, &c., within the buildings are laid in subways, and the whole of the engineering work has been so designed as to obviate the necessity of the engineering staff passing through any part occupied by patients to obtain access to same.

The following detached buildings are provided in addition to the main asylum :— Chapel, mortuary, farm buildings, six cottages for staff, two entrance-lodges, cottage for bailiff, garden buildings. The committee have purchased houses already existing on the estate for the medical superintendent and the clerk and storekeeper. The contractors for the buildings were Messrs. J. Linton & Co., of Newport; for the electric plant Messrs. Bertram Thomas, of Manchester; and for the electric wiring and fittings, fire-alarms, telephones, &c., Messrs. Lowdon Bros. & Co., of Dundee, while Mr. W. B. Partington acted as clerk of the works.

ARCHITECTURAL CENSORSHIP.

A MEETING of the Architectural Craftsmen's Society was held last Friday in the Technical College, Glasgow. Mr. J. Campbell Reid read a paper on "Architectural Censorship." Mr. Reid showed by numerous lantern views architectural mistakes, due to the want of proper supervision of architectural schemes, with reference to the relation of new buildings to their surroundings, which were often of real architectural or historical value, and were thrown out of scale by the new structures. The lecturer advocated the appointment of small committees for each district of large towns, who would form an Architectural Court, before whom all plans for proposed buildings would be submitted after having been sanctioned by the Dean of Guild Court. These committees would refer any schemes opposed to architectural principles to the censor, who would be an architect or artist of repute appointed by the Government, and whose decision would be final. Mr. Reid also advocated the laying out of new streets by architects, who would introduce more varied lines than those laid down by engineers, and thus relieve the monotony of many of our thoroughfares.

ST. LOUIS EXHIBITION.

A LONG period is always necessary to produce a report on the British section of an international exhibition in another country. The St. Louis Exhibition was held in 1904, but the report of the British Commissioners did not appear until last week. It states that the decoration of the British courts was arranged in a manner different from that which had been adopted in previous international exhibitions abroad. It had been the custom to leave to each exhibitor the decoration of the space allotted to him, giving him liberty to put up such façades as he deemed desirable, subject only to the limitations of height and other conditions imposed by the regulations made by the exhibition authorities. Experience showed that the result left much to be desired. In the case of the St. Louis Exhibition, the executive committee decided to enclose the whole of the British space in each building with an ornamental façade or enclosure entered through archways inscribed with the words "Great Britain and Ireland." The design adopted for the façade and archways was uniform throughout the exhibition, so that visitors could at once recognise the spaces occupied by Great Britain. The façade was decorated with groups of the British national flags arranged at suitable intervals. The result of the scheme was eminently successful, and it was well worth the additional expense involved in carrying it out. The whole work of erecting the façade and of providing screens, flooring and other necessary details of construction was carried out by Messrs. George Trollope & Sons, of London, who executed the work in a very satisfactory manner, and completed it by April 30, notwithstanding considerable difficulties, in particular those due to the state of the labour market at St. Louis and the frequent strikes of the workmen.

On account of the large number of collective exhibits organised by the Royal Commission, it was necessary to provide show-cases in considerable quantities. To have had these made in England and sent to St. Louis would have entailed heavy cost for transport, and as it was found that they could be manufactured locally at a reasonable rate, a contract was made for their construction at St. Louis, The result was satisfactory, and in many instances it was possible to hire plate-glass for the cases instead of purchasing it, thus effecting a considerable economy. After the close of the exhibition the majority of the show-cases were disposed of locally, though at a considerable depreciation on the price originally paid.

The storage of the empty packing-cases during the period of an exhibition is always an important consideration. It is necessary that they should be removed as soon as possible from the exhibition buildings after the goods have been unpacked, that they should be safely stored during the exhibition period, and promptly returned for repacking at its close. At St. Louis a concession was given by the exhibition authorities to the General Service Company, who were allowed to erect warehouses in a remote part of the grounds, and to charge a fixed rate for removing and returning cases and storing them until required. In order to insure the proper storing of the British cases, an arrangement was made with this company whereby a definite portion of a warehouse was hired for the exclusive storage of British cases. This saved much time and trouble at the close of the exhibition. On the whole the system was fairly satisfactory, although in certain particulars work was unnecessarily thrown on the staff of the Royal Commission.

A principal cause of delay both in the original installation, and still more in the removal of exhibits after the close, was due to the United States Custom House regulations. By the Act of Congress authorising the exhibition it was enacted that articles sent for exhibition should be admitted free of duty provided that they were exported, but this, though apparently a simple matter, was seriously complicated by the elaborate system of checks adopted by the United States Custom House authorities with a view to insure that nothing should remain in the United States without paying duty. Every article, however small, had to be checked and scheduled by a Custom House officer before being installed for exhibition, and rechecked before it was allowed to be packed for return to England. In many cases this caused weeks of delay in repacking, especially as the amount of work was greater than the Custom House staff could manage. Under United States laws articles presented to certain public institutions are exempted from duty. But in the case of articles so presented by the Royal Commission, or by foreign exhibitors, the formalities to be gone through were very complicated. Articles sold for delivery at the end of the exhibition were, of course, charged with duty, as were also articles stolen during the exhibition. But of these latter there were fortunately few so far as British exhibits were concerned.

As a large number of the British exhibits were collective, and the exhibitors had no representative of their own at St. Louis, the Royal Commission undertook the sale of certain articles for delivery at the close of the exhibition. The total value of the sales effected was as follows:—

Department of art	£7,444 1 1
Department of manufactures . . .	392 3 3
Other departments	159 5 9
Total . .	£7,995 10 1

Out of the amount received from purchasers the cost of Customs duties and other expenses were paid, and the balance was handed over to the exhibitor. The sales account was kept completely separate from the general account of the Royal Commission. The Custom House regulations of the United States made the business of sales very complicated. The catalogue of the British section was prepared in London, and was ready for issue by the opening day. There was a separate catalogue for each department. These, bound together, formed the complete catalogue. The system of departmental catalogues was found very convenient, and they had a readier sale than the more bulky volumes of the complete catalogue. The catalogue for which there was the largest demand was that of Her Majesty Queen Victoria's Jubilee presents, 13,482 copies having been sold during the exhibition period. The timely issue of the British catalogue was found to be particularly convenient, owing to the fact that the American official catalogue was late in publication. A preliminary edition of this was issued soon after the exhibition opened, but it required much revision, and the complete edition was not ready before the first week in November.

The meeting of the Jury of Awards is always an important episode in an international exhibition. According to the regulations for the St. Louis Exhibition, the jury should have assembled on June 1, 1904, but as the weather in St. Louis during the summer is usually very hot, and as the installation of many exhibits was not really completed until long after the opening day, it was decided to postpone the date of meeting to September 1.

There were three classes of juries, *i.e.* group juries, of which there were 144; department juries, of which there were fifteen; and a superior jury. The group juries were in most instances composed of Americans and foreigners in equal numbers. Each jury elected its chairman and vice-chairman, of whom generally the chairman was American and the other foreign. The department juries consisted of the chairman and vice-chairman of each of the group juries, with two additional American members. As in the case of the group juries, each department jury elected its chairman and vice-chairman, of whom the one was American and the other foreign. The last, or superior jury, of which the President of the Exhibition was president, was composed of the director of exhibits, a citizen of the United States nominated by the National Commission, the chiefs of all departments, the chairmen and vice-chairmen of the department juries, and twelve of the foreign Commissioners-General,

Digitized by Google

representing the countries who had sent the most important foreign exhibits. The superior jury consisted in all of thirty-four American and twenty-seven foreign representatives. There were four vice-presidents, of whom two were American and two foreign.

The British group jurors, of whom there were seventeen, were selected by the committees of the Royal Commission dealing with the different subjects, and were appointed by the executive committees. That the selections were satisfactory was proved by the fact that in eleven instances the British juror was elected as chairman or vice-chairman of the group jury, and thus became a member of the department jury.

Two were again elected as vice-chairmen of the department juries, and became members of the superior jury, upon which Great Britain had three representatives, *i.e.* the two jurors and the Commissioner-General, who was a member *ex officio*.

The awards were of four orders of merit, as follows :—Grand prizes, gold medals, silver medals, bronze medals. All exhibits were examined by the group juries, who recommended the awards to be given and forwarded the lists to the department juries for consideration. The department juries approved or revised the recommendations of the group juries, and submitted their decision to the superior jury, whose decision was final after review of every case in which exhibitors asked for reconsideration. As by the regulations of the exhibition the superior jury had to terminate its business by October 15, 1904, and as a certain number of appeals were not settled by that date, these were referred to a standing committee consisting of the president and vice-presidents of the superior jury, who were empowered to continue until all business was completed. The work of the juries was carried out in a very satisfactory manner, and British exhibitors were quite content with the decisions. In a few cases appeals were made, and these were fairly and fully considered by the superior jury.

The British exhibits in art, education and social economy were withdrawn from competition with the sanction of our executive committee, and in the other departments of the exhibition in which British exhibits entered into competition the number of awards was as follows :—To exhibitors—Grand prizes, 126; gold medals, 204; silver medals, 129; bronze medals, 77. To collaborators—Grand prizes, 7; gold medals, 43; silver medals, 38; bronze medals, 54.

TESSERÆ.

Marble in Roman Houses.

IT was not till the latter times of the Republic, when wealth had been acquired by conquests in the East, that houses of any splendour began to be built in Rome, but it then became the fashion not only to build houses of an immense size, but also to adorn them with columns, paintings, statues and costly works of art. M. Lepidus, who was consul B.C. 78, was the first who introduced Numidian marble into Rome for the purpose of paving the threshold of his house, but the fashion of building magnificent houses increased so rapidly that the house of Lepidus, which in his consulship was the first in Rome, was thirty-five years later not the hundredth. Lucullus especially surpassed all his contemporaries in the magnificence of his houses and the splendour of their decorations. Marble columns were first introduced into private houses by the orator L. Crassus, but they did not exceed 12 feet in height and were only six in number. He was, however, soon surpassed by M. Scaurus, who placed in his atrium columns of black marble called Lucullean, 38 feet high, and of such immense weight that the contractor of the sewers took security for any injury that might be done to the sewers in consequence of the columns being carried along the streets. The Romans were exceedingly partial to marble for the decoration of their houses. Mamurra, who was Cæsar's praefectus fabrûm in Gaul, set the example of lining his room with slabs of marble. Some idea may be formed of the size and magnificence of the houses of the Roman nobles during the later times of the Republic by the price which they fetched. The consul Messalla bought the house of Autronius for 3,700 sestertia (nearly 33,000*l.*), and Cicero the house of Crassus, on the Palatine, for 3,500 sestertia (nearly 31,000*l.*). The house of Publius Clodius, whom Milo killed, cost 14,800 sestertia (about 131,000*l.*); and the Tusculan villa of Scaurus was fitted up with such magnificence that when it was burnt by his slaves he lost 100,000 sestertia, upwards of 885,000*l.* The house rent which persons in poor circumstances usually paid at Rome was about 2,000 sesterces, between 17*l.* and 18*l.* It was brought as a charge of extravagance against Caelius that he paid 30 sestertia (about 266*l.*) for the rent of his house.

Natural Swags.

The art of weaving wreaths, garlands and festoons in Greece and Rome employed a distinct class of persons who endeavoured to combine all the most beautiful varieties of leaves, of flowers and of fruits so as to blend their forms, colours and scents in the most agreeable manner. At Athens there was a market for the manufacture and sale of this class of productions, the work being principally performed by women and girls. When a priest was preparing a sacrifice he often appeared with a festoon intended to be placed on the door of the temple, on the front of the altar or upon the head of the victim. Thus in the Iliad, Chryses, besides the gilded sceptre which denoted his office and authority, carries a garland in honour of Apollo, which was probably wound about the sceptre. A bas-relief in the collection of antiques at Ince-Blundell represents a priestess carrying in her two hands a festoon to suspend upon the circular temple which is seen in the distance. As the festoons remained on the temples long after their freshness had departed they became very combustible. The Temple of Juno at Argos was destroyed in consequence of their being set on fire. The garlands on funereal monuments hung there for a year, and were then renewed. The funeral pile was also decorated in a similar manner, but with an appropriate choice of plants and flowers. Festoons were placed upon the door-posts of private houses in token of joy and affection, more especially on occasion of a wedding. They were hung about a palace in compliment to the wealthy possessor, and on occasions of general rejoicing the streets of a city were sometimes enlivened with these splendid and tasteful decorations. Smaller garlands or crowns were worn by persons on the head or round the neck. The fashion of wearing such garlands suspended from the neck was adopted by the early Christians.

Society of British Artists.

The Society of British Artists was established in 1823 with the object of the erection of an extensive range of galleries for the annual exhibition and sale of the works of living artists of the United Kingdom. For this purpose a house was built in Suffolk Street, Pall Mall East. The first exhibition took place in 1824. It consisted of oil and water-colour paintings, sculpture and engravings, and was enriched with the productions of Hofland, Haydon, Heaphy, Linton, Glover, Martin, Blake, Simpson, &c. In purchases and commissions the first exhibition produced nearly 4,000*l.*, whilst the receipts at the doors greatly exceeded the demands of an unavoidably expensive year. The following were the classes into which the donors and subscribers to the Society of British Artists were divided :—Class 1.—A donor of 100 guineas to be entitled to a transferable free admission ticket to the gallery, for an unlimited number of friends for life. Class 2.—A donor of 50 guineas to be entitled to a transferable free admission ticket for self and two friends for life. Class 3.—A donor of 10 guineas to be entitled to a free admission for self and friend for life. Class 4.—A donor of one guinea per annum to be entitled to a free admission for the season for self and friend. Class 5.—Amateur donors of 20 guineas or upwards may become honorary members. Class 6.—A subscriber or lender of 100 guineas to be entitled to receive an annual dividend of 5 per cent. and a free admission for self and friend for life. Class 7.—A subscriber or lender of 50 guineas to be entitled to receive an annual dividend at the rate of 5 per cent. and a free admission for life. Class 8.—Subscribers being members of the Society to be entitled to receive an annual dividend at the rate of 5 per cent. on whatever sum they may subscribe. All the interest to be paid from the profits of the Society.

A Joint Committee of the Ulster Society of Architects, the Belfast Art Society, and the Ulster Arts Club, propose holding in the Municipal Art Gallery, Belfast, an exhibition of pictures. Through the courtesy of Mr. Hugh P. Lane the committee will be able to obtain on loan from private owners several pictures by Watts and parts of the "Durand-Ruel," "Staats Forbes," and "Lane" collections, including works by Whistler, Steer, Corot, Courbet, Fantin, and Puvis de Chavannes.

Digitized by Google

GENERAL.

The Liverpool Academy of Arts on Friday elected Professor Reilly and Mr. G. Chowne full members. Out of sixteen candidates for associateship five were elected.

The Manchester Art Gallery Committee propose to hold an exhibition of water-colour drawings during the months of April, May and June of this year. The exhibition will be opened on Wednesday, April 11, and closed on Saturday, June 30.

The Dundee Lunacy Board have instructed Mr. T. M. Cappon to prepare plans of the buildings at the Westgreen Asylum. The commission will be 50 guineas.

A Committee, comprising Sir Henry De Villiers, Sir John Graham, Adv. Searle and Attorney C. H. Van Zyl, has been appointed to act in conjunction with Mr. Mervyn Macartney in connection with his work as assessor in the competition for the law courts to be erected in Cape Town.

The Late Mr. Capper Pass has bequeathed the sum of 1,000*l.* to the Bristol Art Gallery, to be expended on purchasing the works of local artists.

The Council of the Edinburgh Architectural Association have resolved to write to the Greenock School Board protesting against the conditions issued by them relating to the competitive plans for the new school at Cartsburn. It is considered that if the conditions are adhered to it would be derogatory to any architect to compete.

The Royal Scottish Society of Painters in Water Colours have elected the following officers:—President, Sir Francis Powell, LL.D.; vice-president, Wm. M'Taggart, R.S.A.; deputy-president, Wm. Young; treasurer, Wm. Young; council—James G. Laing, Patrick Downie, R. M. G. Coventry, C. J. Lauder, John P. Downie and R. Clouston Young representing the West, and Ewan Geddes, G. Nasmyth Langlands, R. Gemmell Hutchinson, Miss C. P. Ross, James Paterson and James Cadenhead, representing the East.

The Senate of Glasgow University will confer the honorary degree of Doctor of Laws (LL.D.) on Sir James Guthrie, President of the Royal Scottish Academy, and M. Auguste Rodin, president of the International Society of Painters, Sculptors and Engravers.

Mr. Roger Fry, of the New English Art Club, has accepted the appointment of curator of the Metropolitan Museum of Art in New York.

Applications for particulars concerning a competition for elementary schools in Wrexham have been received from over 200 architects.

At the last Meeting of the Architectural Association of Ireland Mr. R. M. Butler read a paper on "The Housing of the Irish Rural Labourers." He described the procedure adopted, and stated that no less than 20,000 cottages have during the last twenty-three years been built in Ireland, at a total cost of between 3,000,000*l.* and 4,000,000*l.* He also remarked on the untrained and unscrupulous architects and contractors employed by many councils, and urged the registration of architects and the "starring" of bad contractors as a remedy.

The Peak District and Northern Counties Footpaths Preservation Society, in their annual report, record that Mr. Gilson Martin, J.P., the Duke of Devonshire's agent, was interviewed with respect to the closing of the footpath leading past the Druid's Circle on the moors near Eyam. The agent denied that the footpath was a public one, and suggested that if the Society pressed the matter the Duke of Devonshire would consider the advisability of closing Chatsworth, having only insufficient evidence that the footpath was a public one the Council did not take any further steps.

A Tablet given by his Honour Judge William Evans in memory of Richard Wilson, R.A., the landscape painter, has been unveiled in the parish church of Penegoes, the village where Wilson was born.

A New Theatre, capable of accommodating 1,500 people, is to be erected shortly at the back of the Castle Hotel, Queen Street, Scarborough. The plans have been approved by the Corporation, and the building is to be of fireproof construction. Messrs. Davis & Baker, Scarborough, are the architects.

For the new Central Library at St. Pancras the following architects have been selected for a limited competition:—Messrs. Maurice B. Adams, J. S. Gibson, Mallows & Cross, Russell & Cooper, Wills & Anderson, and E. Wimperis.

The Liverpool City Council have adopted the recommendations of the library, museum and arts committee that the pictures *The Captive Butterfly*, by E. A. Hornel, and *En Conseil de Famille*, by L. R. Garrido, be purchased from the Autumn Exhibition for the Permanent Collection, and that the application of the Berlin Photographic Company to reproduce the picture *A Summer Night*, by Albert Moore, and for the loan of the picture for a period of not exceeding three months, on payment of a fee of 100*l.*, be granted.

M. Harpignies, the French painter, has offered to the Government a series of his drawings to be added to the collection in the Luxembourg, which was lately formed. Another series by him will be presented to the city of Paris.

Contracts have been settled by the Bridlington Corporation for a new pavilion to hold 3,500 persons, designed by Messrs. Mangnall & Littlewoods, architects, Manchester The building will have an inclined floor, gallery round three sides communicating with outside balcony, and proscenium with stage. There will also be a large café communicating with the pavilion.

A Number of ancient dwelling-houses are to be demolished at Bermondsey. The houses have fixed in their walls a number of gate hooks, which are the only remaining relics of the old Abbey of Bermondsey, which was founded in 1081 and pulled down at the Dissolution of 1539.

The Trustees of the late Mr. John Clark, advocate, Aberdeen, have decided to wipe off the balance of debt on the Aberdeen Art Gallery, amounting to 4,000*l.*, on condition that the Town Council arrange for the future maintenance of the Gallery. It was largely through the liberality of the trustees that the recent reconstruction of the building and the addition of the Sculpture Court was carried out, and this is the third contribution the Clark trustees have made to the Gallery, making a total of 12,000*l.* The Gallery will be free of debt if the Town Council agree to the conditions of the offer now made.

The Local Government, Records and Museums Committee of the London County Council announce that the acquisition and restoration of the premises No. 17 Fleet Street—at the time of their purchase some years ago alleged to have been the palace of Cardinal Wolsey—will cost London altogether 28,700*l.*, but of this amount the City Corporation has contributed 2,500*l.*, and a further sum of 1,244*l.* will be obtained from that authority in respect of land surrendered for the widening of Fleet Street. The premises are let at 600*l.* a year, and the net result will be a charge in the first year of 646*l.*, disappearing in forty-seven years. The committee is considering the question of the utilisation of the "council chamber," which has been reserved for public use. The oak panelling and carving in this room belonged to the original building, and the ceiling is an excellent example of Jacobean enriched plasterwork.

A Deputation appointed by the Midland Arts Club, Birmingham, is to wait upon the art gallery committee to advocate the claims of local artists for recognition when carrying out the conditions of the late Mr. John Feeney's bequest.

Count Plunket, F.S.A., delivered a lecture to the Dante Society on Wednesday evening upon "Overbeck and the German Pre-Raphaelites."

The Architectural League of America opened at New York on January 31 their seventh annual convention. The proceedings were to last three days. The only lecture to be delivered was by Professor A. D. F. Hamlin, of Columbia University, on the relation of sculpture and painting to architecture, treated from an historical standpoint. The League has secured by gift from Harvard University three scholarships in architecture, two to be awarded on the results of competitions held by the various clubs in the League, and the third to the member of the League passing the highest regular entrance examination. Each scholarship is equal in amount to one year's tuition Funds have been pledged for a foreign travelling scholarship amounting to 1,200 dols. It is hoped and expected that this competition will be an annual affair.

The Foundation Stone has been laid of a new Roman Catholic church for the Richmond Park district, Bournemouth. The architect is Mr. Gilbert Scott, and the contractors Messrs. McWilliam & Son.

The Acton District Council have decided to erect the municipal offices from the design of Mr. H. G. Hunt at a cost of 67,000*l.*

The Architect.

THE WEEK.

JOHN POLLARD SEDDON, who died on the 1st inst. in his seventy-eighth year, was at one time among the most prominent Gothicists in England. To him it was more than a style; it was an artistic faith. When so many who appeared to be no less enthusiastic found it necessary to make concessions and by degrees to adopt a different style, he alone remained faithful among the faithless. The fashion of architecture being in favour of forms which JOHN SEDDON at one time scorned, his name was not prominent in later years. But he was both brave and versatile. Instead of bewailing the weakness of the age, he boldly took up stained-glass painting and decoration. To fill up a spare hour he was willing to produce a painting or a water-colour drawing which he frankly declared to be no more than a pot-boiler. That he was an able writer there is sufficient evidence in the pages of *The Architect*. His later years were therefore as creditable to him as those when he was busy as an architect; and, indeed, he recalled those Mediæval artists who could build as well as design. He was born in 1827, and was educated at the Bedford Grammar School. His skill as a draughtsman and a writer was displayed at an early period. Drawings of French churches and cathedrals which he made as a young man were remarkable for vigour. He was among the first to be fascinated by RUSKIN'S essays, and indeed there was often a close resemblance between their manner of treating subjects. His partnership with Mr. PRITCHARD enabled him to design several churches and schools in the West of England and Wales. Llandaff Cathedral was restored under their direction. The firm was represented in the Paris International Exhibition of 1855 by a design for a mansion near Milford Haven and drawings of a church near Cardiff. Afterwards JOHN SEDDON obtained many commissions when he had established himself in London. In those days a Gothic architect was expected to be a propagandist for the style, and he aided the cause in many ways. He was honorary secretary of the Institute for a time. When the competition for the Law Courts in the Strand was being arranged he was one of the artists selected. His design was remarkable for the immense tower which was intended to serve for records, but which in the drawing appeared to dwarf the building. He had great energy with artistic power, and he certainly merited a much larger practice than he attained. His life was laborious, but he has obtained rest, and has passed away with the respect of all who were acquainted with him.

THE conference of local authorities who are directly concerned in the destruction of the coast by the sea was a demonstration of the extent of the danger. There were thirteen delegates present, and other local authorities expressed their interest in the effort. The representative of Bridlington said that it had cost the local authority 100,000*l.* for the protection of one mile of coast. That involved an annual repayment of 2,864*l.*, to raise which a 9*d.* rate had to be imposed. In Filey the rate for a similar purpose amounts to 1*s.* 1½*d.* in the pound. It was laid down by Mr. Justice FRY that it is the duty of the Crown to protect the land, both from foreign enemies and from the water which surrounds the island, although the right of the subject to have the duty performed could not be enforced by the Court. It was therefore resolved "That steps should be taken to obtain some assistance from the Imperial Exchequer towards the ever-increasing burden of expense which local authorities on the seaboard are compelled to bear owing to the constant erosion by the sea, and that, with a view to carrying out this object, a petition be presented to His Majesty the King in Council, praying that right may be done in the premises." Another resolution was:—"That representatives of this conference be appointed to approach the Prime Minister and President of the Board of Trade to request the Government to introduce into Parliament a Bill declaratory of the aforementioned principles, and to define ways and means whereby some relief towards, or allowance in respect of, the cost and maintenance of protective works might be contributed by the Government." A committee of representatives of the local authorities of Herne Bay, Southwold, Aberystwith, Rhyl, Ventnor, Bridlington and Eastbourne was appointed to frame a petition to the King in Council, and to submit the same for approval at a subsequent meeting of the conference. It must be allowed that at the present time sufficient care is not taken of all parts of the coast. In some places the lord of the manor, or owners of neighbouring land, claim the sole right either to operate on the coast, to remove shingle, or to allow the sea to exercise its full power. Even the owners of a site for a small house claim to be omnipotent over some 20 feet of coast, and often boast of their privilege. Local authorities are not always able to contest those rights. What is desirable is that the County Councils should exercise entire control over the coast as far as it abuts on their respective counties, and should be allowed to raise the money required for protecting the land.

PROBABLY the earliest local museum in Great Britain was established in Perth, the Fair City which was the scene of so many historical events. The contents of the museum may not be remarkable, but they are suggestive. The building containing the museum is modern and in good condition. Perth is much visited by tourists, but apparently they remain only for a limited number of hours, and they prefer to enjoy the scenery rather than to inspect the museum. The majority of the members of the Antiquarian Society likewise avoid the rooms. But although it may be neglected, the museum cannot exist without more or less expenditure, and it is found that the subscriptions are not equal to the outlay. Some propose that the whole of the contents as well as the building should be made over to the Town Council if that body would accept the gift. Other members who are more sanguine consider there are enough lovers of antiquity in the district who would make an effort, if called on, for the preservation of an institution which has had an existence of about a century and a half. Local museums are desirable. But if a city like Perth cannot uphold one, there is less likelihood of support in other places.

SPARTA has not been fruitful in yielding examples of art, although it cannot be said that the people were entirely indifferent to sculpture. The British school at Athens has been entrusted with excavations in the province of Laconia. Trials have been made at Thalamae, Geronthrae, and Angelona. Fortifications have been surveyed and a catalogue prepared of the contents of the museum at Sparta. Mr. G. A. MACMILLAN, the chairman of the managing committee, says that:—"In conjunction with the survey trial, excavations will be made with a view to ascertaining the extent of the remains, their general character and state of preservation, and the prospects of an excavation on a larger scale. When the heat brings work at Sparta to an end the excavations at Geronthrae will be continued, and possibly other sites may be tested. Serious attention will be given also to the remains of the Byzantine and Frankish periods, in which the province of Laconia is so rich. For this work the committee have secured the services of an able architect, Mr. RAMSAY TRAQUAIR, of Edinburgh." As usual, money is the obstacle to systematic research. At least 700*l.* or 800*l.* will be required, towards which sum the subscribers to the school have given 200*l.* Contributions will be received by Dr. LEAF, the treasurer, 6 Sussex Place, Regent's Park, and the investigation is one that should appeal to architects.

THE PROPOSED TECHNOLOGICAL INSTITUTE.

THE final report of the departmental committee on the Royal College of Science, &c., is a document which must give rise to serious reflections on the part of many professors of science in London. Tennyson noted "the sublime repression of himself" as one of the characteristics of the Prince Consort, and there will have to be a general exercise of that quality if the recommendations of the committee are carried out. Professors who have gained reputation in certain positions will find themselves, if they are accepted, recommencing in a novel institution. It must be admitted, on the other hand, that as technical education of the kind that is recommended was only lately desired in this country, and that the arrangements for the purpose were improvised rather than deliberately thought out, changes are indispensable. The origin of education in applied science can be traced not to universities or colleges, but to the geological survey which was established in 1846 under Sir Henry de la Beche. The original officers, although able men, received about 9*s.* a day, and on that account they were enough to deter students from following science. In fact, at the time there were no other public appointments open to men who had studied any branch of science. They were supposed to find sufficient opportunities for the exercise of their knowledge in trade and manufactures.

The advantages of a geological survey, even if carried out at the low rate of 9*s.* a day, was not evident to the majority of people. It became necessary to demonstrate that serious losses in fruitless mining enterprises might have been avoided if geological science had been recognised. More than a million sterling must have been expended in efforts to find coal under impossible conditions. As a means of diffusing knowledge about the earth's surface, a school of science applied to mining and the arts was opened in London in 1853, the teachers being geological surveyors. That they were pleased by the change is evident from a letter of Beete Jukes, who said, "I am almost tired of perpetual field-work, and long to read and to lecture." Soon afterwards a Museum of Irish Industry was set up in Dublin, in which other officials besides geological surveyors acted as professors. A Royal College of Chemistry was opened in Oxford Street as an auxiliary to the School of Science, although without any direct connection with the geological survey.

For a time the scientific classes were independent of the arrangements made about the same period for the teaching of practical art. But Henry Cole was able to convince the Government that there would be advantages if both science and art came under one control. The Mining School underwent several changes of title, and eventually became the "Royal College of Science, with which is incorporated the Royal School of Mines." It would be vain to deny that the School of Mines, although appearing to occupy only a secondary position, is at the present time the dominant factor of the Royal College of Science. What is more extraordinary, it appears to occupy a similar position in the final report of the departmental committee. The school has been successful, and the possession of South Africa has opened a new field for trained miners.

However favourably we may be disposed to consider the official arrangements for the teaching of science, they can only be accepted as substitutes for a better system, for they will not bear comparison with those adopted in various other countries. There is no doubt that students from some of our colleges and schools are to be found in responsible positions. But they would not be likely to admit that their only training was in the class-rooms. In all those institutions a large percentage look forward to occupation as teachers, and some may expect to obtain official employments where only a limited amount of skill or knowledge is required. When the English schools are compared with those of Germany, as is done by the committee, it will be evident that, whatever may be the success of individual Englishmen, the system adopted with us is inferior to that followed abroad. The report states that:—"So close is the connection which is considered in Germany to exist between technical education and industrial prosperity that the Germans believe that the establishment and maintenance of these institutions, merely as a financial speculation, have repaid over and over again the vast expenditure incurred, and that they have been of benefit, not only to the few who gain directly, but to the wage-earning classes and the mass of the nation as a whole, by being the means of creating new industries, by preventing the decay of existing industries, and by increasing the demand for skilled labour."

Some people may say that the easiest course for us to follow would be to establish schools like those in Germany, Switzerland and America. But there are vested interests which have to be considered. Under the Board of Education are colleges and schools. The guilds of London have at least two colleges. The London University has also a scientific department, and has possibilities which are not possessed by any other educational institution in this country. All these bodies have to be reckoned with. They cannot be suppressed and probably will not be surpassed. Policy, therefore, dictates that they should be utilised as far as circumstances will allow. The President of the Board of Education has great powers, but he cannot call into existence a technical institution of the kind which many theorists see in their visions. Probably the most that is attainable will be to make the new institution subservient to the University of London.

The Government—*i.e.* the Board of Education—are favourably disposed to the new project. Assuming that the Royal College of Science, including the School of Mines, is brought in, the Treasury are prepared to place at the disposal of the new institution the buildings now used for the purposes of the Royal College of Science at South Kensington on the east side of Exhibition Road, and the buildings in course of erection for the same purpose on the west side of the road; to grant 20,000*l.* per annum in respect of the cost of the staff and of the laboratory expenses; to maintain for the present both sets of buildings in external repair; to provide heating and lighting for both sets of buildings and to pay local rates; to satisfy the claims of the staff for such pensions as may be assumed to have accrued up to the date of transfer. The Council of the City and Guilds of London Institute are also willing to share in the common government and administration that is proposed. The Commissioners of the Exhibition of 1851, who have already given so much land as sites for educational buildings, will place an extensive site for such buildings as will have to be erected for the proposed institution. From this it will be seen that there is a possibility of a start under most favourable auspices, and that accommodation will be provided at South Kensington for a very large number of students. The whole history of education, varied as it is, presents no similar instance of provision of the materials required for imparting knowledge. That history also shows that excellent as may be aids and appliances, and indeed for technical purposes they are an indispensable necessity, the communication of knowledge can be best accomplished by the agency of teachers. It will be professors, and not the contents of laboratories and testing-rooms, who will make the institution a success.

The report does not make any suggestion about the kind of professors who are to be engaged in order to impart life to the colleges. It is suggested that there should be a governing body of forty members, who are to have the general management, direction and administration. They will make the appointments. But it is suggested that the professors of the constituent institutions should be regarded as professors of the new institution. How many professors are desirable is not stated, nor what subjects are to be taught. The higher branches

Digitized by Google

of technology should, it is said, be as far as possible concentrated at South Kensington, and it is added that "in the establishment of new departments we do not think it will be possible at present to go much beyond the various branches of engineering, with mining and metallurgy, though we hope provision may be made later for other subjects. We think the principal technical and engineering societies should be consulted as to the departments most requiring development and expansion, and as to the number of students for whom it is desirable to make provision in each department." Higher technology is an attractive phrase, but it would be desirable if a little more precise information were given respecting the kind of work which is anticipated. To express a doubt about the necessity for a biological department is not sufficient to indicate the extent of the course. If we take the Charlottenburg School as a model we know from the report what is taught and what is not. The departments, it is said, consist of (1) architecture, (2) civil engineering, (3) mechanical engineering (including electro-technics), (4) naval architecture and marine engineering, (5) chemistry and metallurgy, and (6) general science. The sixth department, which comprises a variety of subjects, principally branches of mathematics and physics, may be regarded as the common property of the other five.

The recognition of architecture is only just, for the school was established by the union of the Berlin Architectural Academy and the Berlin Industrial Academy, which had coexisted for more than fifty years. But the departmental committee completely ignore architecture. It may be said that architecture as a science will come into the department of engineering. But we cannot find anywhere in the report a statement to show that chemistry, which in a technological sense is the most important of all sciences, is to be taught under conditions which will be superior to those of ordinary colleges. We can take it for granted that by amalgamation much will be gained. But how or in what degree has not been demonstrated. Indeed, from one part of the report we are led to imagine that the inquiry would not have taken place if it had not been that buildings have been erected at a cost of a quarter of a million for a Royal College of Science, and that the Government officials were not clear about the best way of utilising them; or, as the report expresses it:—"If proper advantage was to be taken of the expenditure of this very large sum, it had become a pressing question to settle the future scope and functions of the college."

We have elsewhere reprinted several of the recommendations in the report. They will, we think, convey the impression that at present there is a great deal of nebulosity about the scheme. This contemplated technical institution will be, if it ever come into existence, a leviathan among schools and colleges. But several years will be required for its gestation. To the departmental committee existing institutions are only makeshifts, and as a result they will decline in public favour. It is not impossible, however, that the colossal establishments at South Kensington will be less successful than some of those local organisations for technical education which are now endeavouring to supply the information that is desirable. Meanwhile manufacturers and others who have to sustain competition with foreign rivals will do well to take advantage of every means of acquiring knowledge which is within their reach. The country has had a woeful experience already of the difference between the promises and the performances of South Kensington, and it will not be wise to let the foreigners have their way for some years to come while we are waiting until the governing body of the proposed institution are able to carry out the onerous task which will be imposed on them.

Mr. John C. Dollman and Mr. S. Curnow Vosper were on Saturday elected associates of the Royal Society of Painters in Water-Colours.

SAINTE CLOTILDE, PARIS.

THE discreditable scenes which were enacted at the church of Sainte Clotilde in Paris on the 1st inst. imparts a melancholy though momentary interest to that building. It has now attained an unenviable reputation as a sort of battlefield. But this is not the first occasion it has caused commotion. It is at the present time largely attended by people who are popularly supposed to be the representatives of the old aristocracy—a class who prefer royalty to all other forms of government, and the church has for them special interest, for it can be considered almost as a royal creation. The history of it may therefore be worth narration.

As far back as 1825 the necessity for the erection of a church in the district which lies between the Invalides and the river was recognised. At that time the municipality provided churches as they would other public buildings. In 1827 the site was selected, and it was arranged that the church should be dedicated to St. CHARLES, who was the patron saint of the reigning monarch, CHARLES X. Before a stone had been laid there occurred a revolution, with the result that LOUIS PHILIPPE ascended the throne. Several years were allowed to pass before the erection of the church ceased to be merely a project. The queen was an Italian princess, and was devoted to acts of piety. All her influence was used to have the works commenced. The question of a design was then debated. The Duke of ORLEANS, who was the heir to the throne, was married to a German princess, and, partly to gratify her, the art and literature of Germany were accepted with unusual admiration by courtly Frenchmen. The Romantic movement had also the same tendency, for it favoured all things which were Gothic, and to many French minds Gothic and German were identical.

Accordingly, when in 1846 Queen MARIE AMÉLIE considered it was her bounden duty to have the church erected in the Place Bellechasse, the commission was entrusted to M. GAU, who was a German by birth, but had been for several reasons resident in France and held official appointments. He was also founder of a school for architecture, in which SEMPER was a pupil. He was a native of Cologne, and it was expected that he would erect a church resembling the great cathedral, although on a smaller scale. The selection of the style caused much dissatisfaction, especially among the architects. In 1846 efforts were being made in England to secure the erection of Gothic churches, because the style had at one time prevailed throughout this country. But the Renaissance style had taken such a hold on France that the adoption of Gothic appeared to be a return towards barbarism. The result was a contest between the Court and the building authorities, and it may have been one of the causes which led to the overthrow of LOUIS PHILIPPE two years afterwards. No less than three times the Council of Civil Buildings returned GAU's plans without approval, and three times the Minister of the Interior ordered that they should be carried out. GAU attempted to meet the opposition by taking details from the church of St. Ouen at Rouen with the result that might be expected. In other words, German Gothic and French Gothic did not harmonise. What is still more extraordinary, as if he wished to compliment the reigning family, he introduced also some details from the cathedral of Orleans, and in that way made his designs still more incongruous. The plans were repeatedly submitted to M. DIDRON in order, if possible, to win the approval of that learned archæologist, but without success. Royal power was not to be overthrown for the sake of consistency of style, and in spite of all the opposition the building was commenced.

After the downfall of LOUIS PHILIPPE the works were continued under the Imperial Government. GAU had some claim on LOUIS NAPOLEON, for he had assisted in the production of the work which described BONAPARTE'S expedition to Egypt. He lived until the

Digitized by Google

end of 1853, and then the incomplete building was handed over to THÉODORE BALLU. He at least had shown a true appreciation of Gothic, for he had restored the tower of St. Jacques de la Boucherie, which is one of the finest structures in Paris, and the church of St. Germain l'Auxerrois. Under his direction the work was completed.

The church has a length of about 312 feet and a breadth of 124 feet, and consists of a nave with two aisles. Few modern French churches have been decorated in so costly a manner. It was resolved to emphasise the Mediæval character of the building, and on the windows were employed artists who were then eminent for that class of work, including MARÉCHAL, AMAURY-DUVAL, HUSSON, THIBAUT, HESSE, GALIMARD and JOURDY. For the "Stations of the Cross" PRADIER accepted a commission, and although they are not Gothic in character his high reliefs are worthy of the sculptor of the "Sappho." The bas-reliefs showing the history of Sainte Clotilde are by E. GUILLAUME, who recently died, and was long director of the Academy at Rome. The wall-paintings are by LEHMANN, PILS, LENEPVEU, BEZARD, BRISSOT and others. At the first glance it becomes evident to the visitor that no expense was spared in the adornment of the church, and that it is adapted for a wealthy congregation. It must, however, be owned that neither the building itself nor its decoration produces so satisfactory an impression as others of the modern churches in the city.

Whatever may be its shortcomings, it is to be regretted that the church was treated as if it were a fortification or a barricade last week. The police, firemen and guards had to obey orders, and are, therefore, not responsible for the damage they caused. The blame for the desecration must rest on those who assumed they were defenders of the building, although they must have known that their resistance was more likely to be injurious to the church than to themselves. The authorities were not about to seize any of the valuables which belonged to the church, and all of which being modern productions could not have the interest attaching to the ancient metalwork which is found in some of the old churches of France.

SOME LEGAL BOOK REVIEWS.

"THE Law of Repairs and Improvements."* The subject of this book enters, as the author says in his preface, into some of the chief departments of everyday practical law, and we welcome this attempt at giving it an independent treatment. The book is divided into four parts. In the first part liability to repair as between tenant for life and remainder-man, and between tenant for life and the testator's estate, are first treated of; then follow chapters upon trustees' duties as to repairs, upon improvements, upon repairs and improvements under various statutes, upon repairs and improvements under compulsion, and upon miscellaneous duties to repair. The second part deals with the subject of repairs and improvements as between landlord and tenant. The third part deals with repairs and improvements as between vendor and purchaser. The fourth part deals with the subject of ecclesiastical dilapidations. It will thus be seen that the treatment of the subject is comprehensive. But occasionally the scheme of arrangement adopted does not appear to be altogether adhered to. Part II. deals with the subject as between landlord and tenant, but Chapter XIII. of that part diverges to treat of the duty of repairs as between adjacent neighbours. We should have thought that that subject could have been better treated of in Part I. Again, in Chapter VIII. of Part I. a number of miscellaneous duties are put together which might have come more naturally under appropriate heads in other parts of the work. It is difficult to see, for instance, why the statement that "a purchaser is entitled to improvements arising on property after the contract and before conveyance" comes in that chapter, when the whole subject of repairs and improvements as between vendor and purchaser is fully treated in Part III. The complicated and important question of the construction of covenants, casting upon the tenant liabilities for repairs, rates, taxes, duties, &c., is well discussed in Chapter XX., and all the recent cases are referred to. Perhaps it would be as well to warn readers that, since the decision of some modern cases such as FOULGER *v.* ARDING, many of the older cases and much of the reasoning therein contained cannot be relied on (see GOLDSTEIN *v.* HOLLINGSWORTH per Lord ALVERSTONE, C.J., 1904, 2 K.B. at p. 581). At p. 234 it is said that "agreements relating to the sale of an interest in land must, under the Statute of Frauds, be in writing, and where an agreement as to paying for certain alterations and improvements is so closely connected with an agreement to take a messuage as to be incapable of severance from it, such agreement as to alterations, if not in writing, is also void." But it is surely well known that agreements which do not comply with the Statute of Frauds are not void, but are enforceable by action. That the two things are not similar the case of LEROUX *v.* BROWN (12 Q.B. 801) shows; and at least a reference should have been made to the possible modification of the rule of the Statute of Frauds by the equitable doctrine of past performance. At pp. 149-58 the subject of covenants running with the land and the reversion is dealt with. The principles upon which such covenants run with the land at law and in equity are very different, and we think that it would conduce to clearness if the different principles were clearly and separately explained. When dealing with the liabilities of personal representatives in respect of dilapidations for which a deceased person is liable, we should have expected to see some reference to the case of REID *v.* Lord TENTERDEN, 4 Trywh. 118, 120. These defects may easily be remedied in a second edition. On the whole, we think that the book collects together a mass of authority upon the subject in a convenient manner which cannot be found so collected elsewhere. It should prove useful not only to the lawyer, but to the surveyor and the land agent. The index is good, and the printing and general get up of the book leave nothing to be desired.

"The Law of Easements."* This little book is intended primarily for students, and therefore it does not pretend to do more than supply a clear outline of the subject. The discussion of disputable points is avoided, and only the most important cases are cited. Within the limits which the author has assigned to himself we think that he has succeeded very well. Anyone who reads the book carefully will have acquired the leading principles of a branch of law which is by no means easy to understand. For this reason we think that the book can be recommended not only to students, but also to those whose business brings them much into contact with landed property. A knowledge of the principles of this branch of law will often suggest considerations which should always be present both to vendors and purchasers of houses and land, and to architects and builders. This will be clear if we glance at the particular kind of easements dealt with by the author in Chapter III. They include rights to light, easements relating to the flow of air, easements relating to the flow of water, easements relating to the purity of air and water, easements relating to the support of land and

Digitized by Google

buildings, and ways. We note that the important decision in COLLS *v.* Home and Colonial Stores is adequately dealt with. No doubt the case of KINE *v.* JOLLY (1905, 1 Ch. 480) was decided too late for inclusion. It should be noticed in a later edition. The scope of the book prevents a discussion of doubtful points. We think, however, that when the law is doubtful that fact should be clearly pointed out in the notes. For instance, at p. 106 we think that it should have been pointed out that the case of JORDESON *v.* Sutton, &c., Gas Co. leaves the question of the right to support of land by water in a somewhat uncertain state. Also we think that at p. 12 some reference might have been made to the case of GOODMAN *v.* Mayor of Saltash, L.R. 7 A.C. 633. We agree with the author that it is a wise course to cite an authority for every proposition, nor do we think that the list of cases is too long for the student. Indeed, we should not have minded seeing it longer, especially if the more important had been distinguished in the list of cases by larger type. In the list of cases TULK *v.* MOXHAY is called TULK *v.* MOXHEM.

"Income and Property Tax."* "The object of the present work," says the author, "is to provide a concise and trustworthy guide so that the taxpayer may know his rights and obligations." We think that the author has attained his object. He has clearly digested into 176 propositions a large mass of complicated rules. No doubt many persons evade payment of their just share of the tax, and no doubt this is the reason why the taxing authorities are apt sometimes to assume that all taxpayers are similarly dishonest. This is a very good reason for the production of works like the present. They assist the honest taxpayer to resist the sometimes exorbitant claims made by authorities, who occasionally appear to consider that the presumption is always in favour of the view that evasion is being attempted.

ART AND LITERATURE.

A LECTURE was delivered by Mr. George Russell on the 1st inst. in the Royal Hibernian Academy, Dublin, on "Art and Literature." Mr. Russell said it was necessary to release artists from the dogmas of critics who were not artists. The artist would take advice or criticism from a fellow-artist, but he writhed under opinions derived from Tolstoi or Ruskin, the great theorists. The pure artist was as God made him, and no one—not even Tolstoi or Ruskin—was competent to undertake his re-creation. Beauty was what the artist was profoundly concerned with, and the only moral ideas which he could impart in a satisfactory way were the moral ideas naturally associated with beauty in its higher or lower forms. They had round them the works of an artist who used his art to express his ethical ideas. Where he was weakest was where he summoned consciously to his aid ethical ideas, which found their proper expression in religion or literature. There was no need for art to call to its aid, in order to justify or ennoble it, any abstract ideas about love or justice or mercy. It might express an opinion of these ideas, and yet express truths of its own as high and as essential in the being of man, and it was in despite of himself and in despite of his theories that the work of Watts had and would enduringly have a place in the history of art. He might be asked, Could art express no moral ideas? In the definite and restricted sense in which "moral" was used art must be "unmoral." But let no one represent him as saying that art should be immoral in its nature. And when he said that art was essentially unmoral he meant that the first impulse to paint came from something seen, either beauty of colour, form, or tone. Whether a picture was moral or immoral would depend on the character of the artist and not of the subject. A man would communicate his character in everything he taught. He could not escape communicating it. Art was essentially a spiritual thing. When they asked an artist that he should teach them let them be careful. In that they were asking him to be obvious, and to utter platitudes; they were asking him to debase his art and make things easy for them, who would not climb to the mountain but wanted it to be brought to their feet. The artist, as he created a beautiful form, admitted to his being a nobler beauty than his eyes had seen. His inspiration was spiritual in its rigin, and in it there was always some strange story of the glory of the King. His own conviction was that ethical pictures like some of those he saw around him were, if anything, immoral in their influence, as everything must be which forsook the law of its own being. The true artist would still be instinctively spiritual. Spirituality he should define as the power that certain minds had of comprehending the formulas of spiritual essence, of seeing the eternal in the transitory, of relating the particular to the universal, the type to the archetype. What about the art of the landscape painter? he might be asked; where was its spirituality? A great landscape was the expression of a mood of the human mind as definitely as music or poetry was. There was some mystic significance in the colour he employed. They were looking into the soul when they were looking at a Turner, a Corot, or a Whistler, as surely as when in dreams they found themselves moving in strange countries which were well within them concealed in the hollows of the brain. In this art also was reaching itself out to archetypes. It might seem paradoxical to say of Watts, a man of genius who was always preaching through his art, that it was very difficult to find what he really expressed. No one was ever in doubt about what was expressed by a Turner, a Rossetti, a Corot, or a Millet, who never preached at all, but whose mood or vision, peculiar to themselves, was easily definable. With Watts the effort at analysis was confused, first by his own statement about the ethical significance of his work, which he (the speaker) thought misleading, because, while they might come away from his pictures with many feelings of beauty and mystery, the ethical spirit was not the predominant one. In conclusion, Mr. Russell said that just as in each person there was an undefined and awakened instinct, so in the work of the artist there was something of himself, and a mystery that he might recognise but could not explain.

TECHNOLOGICAL INSTRUCTION.

THE preliminary report of the departmental committee relating to the working of the Royal College of Science, &c., was noticed in *The Architect* on its appearance. We have received the final report from the Board of Education from which we extract the following:—

We recommend that a governing body should be established, consisting of forty members, appointed as follows: six by the Crown; four by the Board of Education; five each by the University of London, the London County Council, and the Council of the City and Guilds of London Institute; four by the teaching staff of the new institution; two by the Commissioners of the Exhibition of 1851; one each by the Royal Society, the Institution of Civil Engineers, the Institution of Mechanical Engineers, the Institution of Electrical Engineers, the Iron and Steel Institute, the Institution of Naval Architects, the Society of Chemical Industry, the Federated Institution of Mining Engineers, and the Institution of Mining and Metallurgy.

The governing body should have the general management, direction, and administration of the new institution, which should be established in the first instance as a school of the University of London.

For the purposes of the new institution the governing body should have the entire disposal of the accommodation provided by the Royal College of Science, including the buildings in course of construction at South Kensington, the Central Technical College, and all buildings which may be erected on the additional site at South Kensington.

The site and buildings of the Royal College of Science, including the buildings in course of construction, should either remain the property of His Majesty's Government or be transferred to the governing body of the new institution, as His Majesty's Government may determine.

The site and buildings of the Central Technical College should, if and so long as they desire it, remain the property of the City and Guilds of London Institute, who should provide for their maintenance and repair.

The governing body should be incorporated, and subject to such special provisions as may be made by their instrument of incorporation they should receive and expend fees and other funds which may be assigned to the purposes of

* *A Guide to Income and Property Tax Assessment and Recovery*. Complete with forms and full illustrations for taxpayers. By H. Theobald, incorporated accountant. (London: The Pioneer Press, 2 Newcastle Street, Farringdon Street, E.C. Pp. 124 and vii. Price 3s. 6d.)

Digitized by Google

the new institution, they should appoint the professors and the other members of the staff, they should determine the departments and subjects of instruction, they should control the arrangement of the courses of instruction and the award of diplomas, and they should make provision for the protection of students now in the constituent institutions and of the existing diplomas. Further, in each of the departments of the new institution the governing body should appoint a board, not necessarily consisting of members of their own body, and including members of the teaching staff and persons with practical experience of industrial requirements, to give expert advice with regard to such particulars connected with that department as the governing body may refer to them.

We recommend that it be an instruction to the governing body to enter into negotiations with the University of London, with King's College, and, pending its actual incorporation, with University College, with regard to the co-ordination of the engineering work of these colleges with that of the new institution. If, for the purpose of carrying out such co-ordination, funds are needed, either for transferring the engineering departments of one or both of these colleges to South Kensington, or for carrying on at these colleges work of an advanced type which would otherwise be done at South Kensington, or in aid of any other arrangement for that purpose to which the governing body may agree, we recommend that the governing body be authorised to incur such reasonable expenditure as may in their opinion be necessary. Subject to such arrangements, we recommend that instruction in the higher branches of technology should, as far as possible, be concentrated at South Kensington. In the establishment of new departments we do not think it will be possible at present to go much beyond the various branches of engineering, with mining and metallurgy, though we hope provision may be made later for other subjects. We think the principal technical and engineering societies should be consulted as to the departments most requiring development and expansion, and as to the number of students for whom it is desirable to make provision in each department. In view of the character of the subjects which will, it may be expected, predominate on the South Kensington site, it must, we think, before long become a question whether the Biological Department of the Royal College of Science shall be retained there. As soon as this question becomes ripe for settlement the provision to be made for that department will be a matter for negotiation.

It may be found possible, even in the immediate future, to make arrangements for the establishment of departments dealing adequately with the greater number of the special sections of applied science. Thus it would seem that certain of these departments might be accommodated in the buildings of existing London institutions, while for others special accommodation would fall to be provided at once in the first additions to the buildings already available on the South Kensington site. For example, in view of the character and standard of the work now carried out by the Central Technical College, we think prominence should be given in the new institution to certain specialised developments of mechanical and electrical engineering.

We have already reported that we think a fully equipped Central School of Mines should be maintained, providing a full course of instruction in mining and metallurgy, especially in the mining and metallurgy of metals produced in India and the Colonies, but not found in workable quantities in the United Kingdom. This would constitute one department of the new institution. In this, as in the other departments, care should be taken that the specialised and advanced instruction is organised with due regard to provision already made elsewhere—for example, it would probably be undesirable to include provision for advanced treatment of the metallurgy of iron and steel.

It should be borne in mind that the traditions and prestige of the Royal School of Mines and the associateship of that school are valuable assets, and we think care should be taken to preserve those traditions and that diploma.

At first, at any rate, we think preliminary training should be given in the new institution. But, while on the one hand we do not recommend that admission to the higher technical courses should be limited to students who obtain their preliminary training there, on the other hand we think that, both as regards the general education of the students admitted and the character of the teaching provided, this preliminary branch of the new institution should be organised with the definite intention of preparing thoroughly suitable candidates for admission to the advantages of the higher instruction which it is the principal object of the new institution to afford.

No student should be admitted to any specialised technical department who has not received, either in the new institution itself or elsewhere, an adequate training of a technical and scientific character such as should be common to every branch of engineering. He should have spent two years on a course of instruction in science, such as he could obtain in a well-organised college or technical institution, after having reached the standard of general education usually marked by university matriculation. An examination test should be imposed on all candidates for admission to the higher departments, except in the case of students who show, by some recognised qualification, that they have received the necessary preliminary training, and when there are more candidates for admission to a particular department than can be received, the best should be selected on a competitive basis.

The preliminary training to be given in the new institution should be of the kind which has just been referred to. It should consist of a course of two years' instruction in science, technology and engineering, of such a character as the governing body consider the most suitable preparation for the specialised courses, and it should be, in the main, common to all students proceeding to advanced instruction in any department. We have already indicated our opinion that students who have not attained a certain standard of general education are not fitted to obtain the fullest advantage from the specialised instruction of the higher departments. We therefore think that evidence of this should be required before admission to the preliminary department.

With regard to educational arrangements we recommend that, subject to reservations made by any constituent institution or co-operating body which may stipulate for the right to enter students under prescribed conditions, students should enter not for any one of the constituent institutions but for the new institution as a whole, with a view to following out courses to be arranged by the governing body.

The professors of the constituent institutions should be regarded as professors of the new institution.

There should be a principal officer of the new institution, who should be responsible to the governing body for the supervision of education and discipline in all the constituent institutions.

It must, in our opinion, be left to the governing body to work out the scheme in detail and to make statutes and regulations for the new institution in general accordance with our proposals.

SOCIETY OF ENGINEERS.

THE first ordinary meeting of the Society of Engineers for the present year was held on Monday evening, February 5, at the Royal United Service Institution, Whitehall. Mr. Nicholas J. West, the President for 1905, first occupied the chair, and presented the premiums awarded for papers read during that year, viz.:—The President's Gold Medal to Mr. Sherard Cowper-Coles for his paper on "The Metallic Preservation and Ornamentation of Iron and Steel Surfaces"; the Bessemer Premium of Books to Mr. Ernest Romney Matthews for his paper on "The Parade Extension Works at Bridlington"; a Society's Premium of Books to Mr. Benjamin Laurenson Bradley for his paper on "The Grindleford Stone Quarries and their Working"; and a Society's Premium of Books to Mr. William Pollard Digby for his paper on "Statistics of British and American Rolling Stock."

The thanks of the Society were also accorded to Mr. B. H. Thwaite for his paper on "The Transport Possibilities of our Inland Navigable Waterways"; to Messrs. C. S. Meik and Walter Beer for their paper on "The Improvement of London Traffic"; and to Mr. A. H. Smith for his paper on "Machine Drills for Hard Rock."

Mr. West then introduced the President for the present year, Mr. Maurice Wilson, to the meeting, and retired from the chair, receiving a hearty and unanimous vote of thanks for his services during the past year.

The President then proceeded to deliver his

Inaugural Address.

The President commenced by thanking the members for the honour they had done him in electing him, and expressed the hope that, advised by the Council, and supported by the members, he would be able to bring his

Digitized by Google

term of office to a close with the knowledge that the Society was in an even better position than at the present time. He briefly reviewed the Society's programme of the past year, pointing out that the papers read and the visits made to works had been of a comprehensive character, and appealing to the members for their increased support by their larger attendance during the coming year. He referred to the recent election as honorary members of Lord Rayleigh and Sir Alexander R. Binnie. Despite deaths and resignations, the membership roll was within seven of the highest on record, and the finances were in a more satisfactory state than they had ever been before.

Turning to some of the notable engineering achievements of the past year, the President alluded to the erection of the bridge over the Victoria Falls in Rhodesia by Sir Douglas Fox and partners, and gave a few particulars as to its construction. He then referred to the boring of the Simplon Tunnel, pointing out that its construction would shorten the distance between Calais and Milan by 80 miles, and between Ostend and Milan by 59 miles. The tunnel was now practically completed, the ballast was being laid, and it was hoped that it would be ready to be opened for traffic in the coming June.

In referring to the opening of the new and enormous dock at Salford in the summer of last year, the President gave some interesting particulars of the work of construction of the Manchester Ship Canal, on which he had been engaged, and he paid a tribute to the skill and enterprise of the contractor, the late Mr. J. A. Walker. He gave some examples of the reduction in cost of the transit of various materials to Manchester by the canal compared with the railways, and spoke hopefully as to the canal's future prospects, showing how matters had steadily improved since the canal was opened in 1894, and mentioning that the yearly revenue had increased from less than 100,000*l.* to over 420,000*l.* in ten years. He gave some particulars of the complete and up-to-date equipment of the docks, and predicted that the canal would eventually be continued across England to Hull.

He next turned his attention to the electrification of the Metropolitan and District Railway, expressing the satisfaction which the community felt at the purification of the atmosphere. The members had paid a very interesting visit to the electric power station at Chelsea in the past summer, and he gave a few particulars of this, the largest station of its kind in the world. He was of opinion that the time was rapidly approaching when large central power stations would be erected in various parts of the kingdom for the distribution of electricity for lighting and other purposes at a much reduced rate.

The President, having next reminded the members that he had for a number of years been engaged in the early education of engineers, expressed his opinions as to the training of youths preparatory to their engineering education. He stated that a boy during the latter part of his school life should be prepared, as far as possible, in the direction that would be most likely to benefit him in after life. He was certain that, at any rate in reference to engineering, that was not done in the majority of cases.

The general effect of that state of things was that, on leaving school, a youth usually found himself so woefully ignorant that he was obliged to spend a considerable time in working up all those necessary matters for his engineering education which he ought to have learnt at school, and that without any reference to higher mathematics.

The President concluded his address with a reference to Mr. George Burt's resignation of the office of hon. secretary and treasurer to the Society. He expressed the great regret of the Society at losing his services, and read the resolution which had been unanimously passed by the Council, and a copy of which had been forwarded to Mr. Burt. He was pleased to be able to state that Mr. D. B. Butler, a past president of the Society, had been unanimously elected as the new hon. secretary and treasurer.

The Dean of Winchester, with the object of aiding the fund for the restoration of Winchester Cathedral, has had a duplicate set of slides prepared for lantern lectures on the Cathedral, which he will send on application to anyone who is willing to lecture on behalf of the Fabric Fund. Notes on the slides, for the use of lecturers, can also be sent. The amount of the fund is now close on 9,000*l.* towards the 20,000*l.* required for the restoration and preservation of the Cathedral.

THE LATE MR. INGLEBY WOOD.

THE death occurred in Edinburgh on the 30th ult. of Mr. Lindsay Ingleby Wood, and by his untimely death, at the early age of thirty-three, a striking personality and a promising career has been brought to an abrupt close. He was an architect by profession, but he was perhaps better known to the public on account of his researches in the fields of art and matters of antiquarian interest. Mr. Ingleby Wood was one of the best known and recognised authorities upon old pewter, and only recently published a book of much historical and literary value dealing with the old Scottish pewter industry under the title of "Scottish Pewter Ware and Pewterers." He was a frequent contributor to journals upon old pewter and kindred subjects, and his opinion was valued and frequently sought from many quarters. He was an artist of no mean order, and his work in black and white had a striking individuality, as was shown in his sketches of "Vanishing Edinburgh and Leith." The late Mr. Ingleby Wood also acted as honorary secretary of the recent successful exhibition of "Architectural Refinements," held last autumn under the auspices of the Edinburgh Architectural Association, and to his administrative ability and untiring energy much of the success of the exhibition was due. The funeral to the Dean Cemetery, where the remains were interred, was largely attended by many personal and professional friends, including members of the Royal Scottish Academy and the President and members of the Edinburgh Architectural Association. A large number of wreaths bore testimony to the regard in which he was held by his many friends who will deplore his early end, and his death constitutes a serious loss to the cause of art and antiquarian research.

MESSRS. WARING'S GIFT TO LIVERPOOL CATHEDRAL.

THE Liverpool Cathedral committee has issued the following statement:—Among the ornaments of our old cathedrals the magnificent carved screens and choir stalls are conspicuous. The chancel of the new Liverpool Cathedral will be more lofty and spacious than that of any existing cathedral in England, and the stalls in the choir to be fitted to such a position must be of specially beautiful design and of suitable proportions. A series of stalls of remarkable beauty and simplicity has been designed by Mr. G. F. Bodley, R.A., and the Liverpool Cathedral committee has just been informed that it is the intention of Mr. S. J. Waring (the head of the well-known firm of Waring & Gillow, Limited) and his sons to present the entire series of stalls to the cathedral in commemoration of their long connection with the city of Liverpool, in which their business originated. The generous gift is, of course, a personal one, but although Messrs. Waring & Gillow, Ltd., do not contribute to it, it is anticipated that the work will be carried out by special workmen in their workshops. No exact estimate of the cost of the work can be given, but owing to the great size of the stalls and the detail of the carved work involved, the cost must be very large—probably not less than 8,000*l.* But the gift, apart from its magnificence, is specially gratifying to the committee as a recognition of the old custom that those who possess special skill in any art should contribute by means of that art to the enrichment of our great churches, and because the circumstances attending the gift are a guarantee that the work will be done in the best possible way and as a labour of love.

Sir Edward Fry, chairman of the Court of Arbitration under the Metropolis Water Act, has sent a letter to the Metropolitan Water Board, in the course of which he says:—"For the year of our chief labours—October 29, 1903, to October 29, 1904—I have received as remuneration a sum of 5,000*l.*; for the intervals before and after that period much smaller sums. I do not desire to retain for my personal use in respect of my services in any year a larger sum than 1,500*l.*, the difference between the salary I received as a Lord Justice of Appeal (5,000*l.*) and the pension which I receive as a retired Lord Justice (3,500*l.*). From the 3,500*l.* thus set apart I deduct 168*l.* 9*s.* 8*d.* for the income tax I have paid on that amount, and a sum of 250*l.* which I have presented to the Institute of Mechanical Engineers, in recognition of their courtesy and in addition to the sum voted by your board, and for the balance, 3,081*l.* 10*s.* 4*d.*, I now enclose my cheque and beg its acceptance by your board." The amount will be put to capital account.

NOTES AND COMMENTS.

In connection with the Seventh International Congress of Architects, to be held in the Grafton Galleries, London, in July next, there will be a chronological exhibition of drawings of English architecture from the Norman Conquest to the death of Sir Charles Barry in 1860. In addition there will be shown a collection of oil-paintings and water-colour drawings by known painters, which treat of architectural subjects. Many of these are scattered throughout the country in private collections. It is hoped that all those who know the whereabouts in private collections of any such paintings or drawings will communicate with the secretary of the executive committee, the Institute of British Architects, 9 Conduit Street, London. Such an exhibition of purely British work should be made as representative as possible in view of the forthcoming visit of our foreign architect *frères*.

Ruskin, when describing the trouble he had taken to seek out and arrange drawings by Turner, and of the indifference to them on the part of the public, said it was to him a frightful discovery that the most splendid genius in the arts might be permitted by Providence to labour and perish uselessly, and that in the very fineness of it there might be something rendering it invisible to ordinary eyes. The amazement of Ruskin must now be felt by many of the people who have visited the Gallery at Millbank this week. There they will see a roomful of examples by Turner, many of which have been allowed to remain during several years in the store-rooms of the National Gallery. About twenty will be found to be unknown to the majority of visitors. All of them possess the characteristics of the master. He never painted finer waves than are to be seen in the views on the Solent, and the *Regatta on the Medway* recalls the treatment of trees and figures which he adopted in some of his Italian pictures. Turner could be exact; but in his best works he had the courage to introduce much which no realist could perceive if he were treating the same subject. Some, no doubt, are greatly changed. *The Exile and the Rock Limpet*, which was supposed to recall Napoleon, is now a wreck, and allowances must be made for others for the injurious effects of time in destroying or changing the colours. But enough remains to suggest, without the aid of other examples, the greatness of the artist. The visitors to the Tate Gallery will also have the satisfaction of seeing some drawings and sketches by Alfred Stevens which have unusual interest.

A by-law made by the London County Council under section 16 sub-section 2 of the London Public Health Act, 1891, provides that, "where a sanitary authority arrange for the daily removal of house refuse in their district . . . the occupier of any premises in such district . . . shall, at such an hour of the day as the sanitary authority shall fix, . . . deposit on the kerbstone or on the outer edge of the footpath immediately in front of the house, or in a convenient, accessible position on the premises, as the sanitary authority may prescribe by written notice served upon the occupier, a movable receptacle in which shall be placed for the purposes of removal . . . the house refuse." The King's Bench division has held, in the case of the Mayor of Wandsworth *v.* Baines, that a sanitary authority cannot compel an occupier to place his house refuse on the kerb if he places it in a reasonably accessible position upon his premises. It would have been a most unfortunate thing, both from the point of view of the public who have occasion to pass along these roads, and from the point of view of those who reside there, if the sanitary authority could have compelled every householder to place his dustbin thereon in order to facilitate the collection of the refuse. And what the sanitary authority of one locality did under the London Public Health Act, the sanitary authority of another locality similarly situated could imitate, irrespective of the character and circumstances of that locality. This decision delivers residential neighbourhoods of the "eligible" class from the fear that an inconsiderate sanitary authority will be able to create a serious nuisance under cover of the London County Council by-laws.

It was a shrewd act to select the unfinished Rue Réaumur in Paris for a competition of façades. By that means unusually attractive buildings have been erected, and the speculators of the future will feel bound to rival the premiated buildings. Four gold medals have been awarded. M. Walwein has gained one for a house in the Louis Quatorze style; MM. De Montarnel have gained the reward for a structure in steel and stone, which evinces a desire for novelty without much regard for ancient styles. The architect of the third building is M. Bousson, who has employed a somewhat Classic style. M. Jacques Hermant's building is of a Louis XVI. type, and the most prominent feature is a clock tower. The builders will receive similar medals, but of bronze, and the proprietors will be allowed a reduction on their share of the expenses in making a new street. A similar competition in London might be an impetus to building of a superior class.

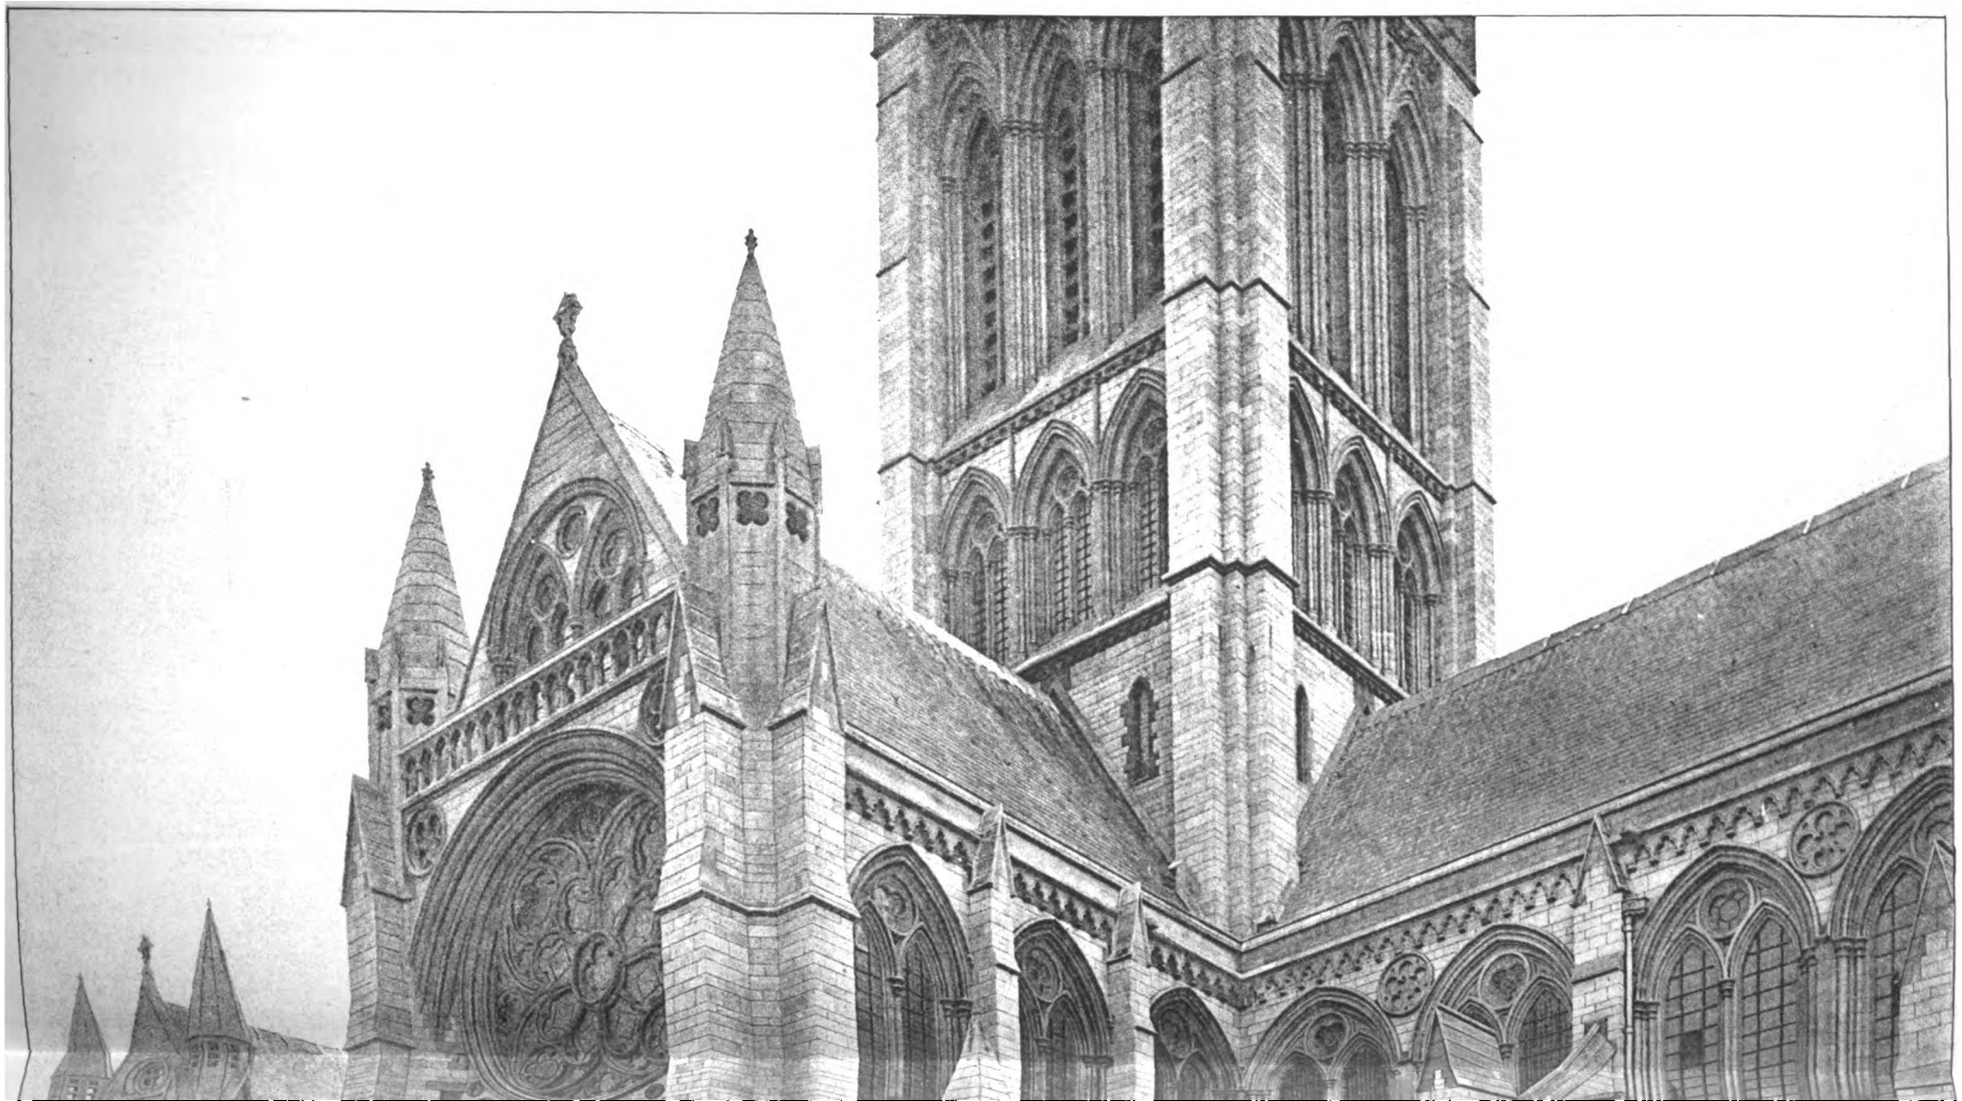
ILLUSTRATIONS.

TOWN HALL, WOOLWICH.

A NEW town hall was a necessity in Woolwich, owing to the inconvenience caused by the distance between the offices of the different departments. A site, having an area of about 9,000 square yards, was obtained for the building, which was opened last month, and of which Mr. A. Bramwell Thomas is the architect. Messrs. Johnson & Sons, of Leicester, were the builders. Including furniture and equipment, the cost was about 80,000*l.*, and, in addition, the site cost 15,204*l.* The town hall has a façade of 114 feet towards Wellington Street, and the depth is 230 feet. The height of tower and belfry is 130 feet. There are stained-glass windows with representation of events in the history of Woolwich. In the building are the council chamber, committee-rooms and seventy offices, and a hall which can accommodate 750 people.

SOCIETY BUILDINGS, NEWHALL STREET, BIRMINGHAM.

THIS building has been erected to suit the requirements of local scientific societies, medical practitioners and professional men generally. The ground floor is separately approached by the central entrance, the first floor by a side entrance, and the other side entrance supplies the remainder of the building, including a large lecture hall on the third floor for the use of the societies. The general contractor was Mr. S. F. Swift, of Birmingham; the electric lift was installed by Messrs. Holt & Willetts, of Cradley Heath; "Fram" partitions were used to divide suites of rooms; the stonework for the front was supplied by the Empire Patent Stone Company, of Leicester.



The name Society Buildings has been altered to "Avebury House," and the building was erected while the firm was Gilbert Smith and Marcus Type—*i.e.* before they mutually dissolved partnership.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Mr. John Belcher, A.R.A., President, in the chair.

Mr. ALEXANDER GRAHAM, hon. secretary, said it was with great regret that he announced the decease of an old and distinguished member of the Institute, the name of one who was known to nearly every one present at the meeting, and who had left behind him a very pleasant memory. John Pollard Seddon was an Associate in 1852, Fellow in 1860, and for many years a member of the Institute Council. He was also one of the hon. secretaries from 1862 to 1867. A vote of condolence and sympathy was passed to the relatives of the deceased.

Royal Gold Medal.

The PRESIDENT announced that the Council intended to submit the name of Sir L. Alma Tadema, R.A., for the Royal gold medal, subject to the approval of His Majesty the King.

Reviews of the Works submitted for the Prizes and Studentships, 1906.

Mr. J. W. SIMPSON read the following:—

The duty laid upon me to-night of criticising the students' work is an honourable one not to be lightly undertaken. It is evident that for criticism to be useful it must be sympathetic; unless the critic can divest himself of personal bias, and regard the work under review from the author's standpoint, he can neither appreciate how far it is successful in attaining the ideal of its creator, nor usually indicate in what respects it may be improved. It is of no help to a student struggling with an imperfectly expressed conception of a thirteenth century church, having a tower at the crossing, to advise him to adopt a plan based upon that of a Grecian temple, and employ a Systyle Doric order. He must be led to an intelligent comparison of his own design with those of the great Gothic masters—to consider the proportions of his tower, and the manner in which it will combine with the other features of his building. His mouldings must be criticised in relation to their positions in the work, and their effect in emphasising its horizontal and vertical lines respectively; the voids and solids, the sky lines and projections, scrutinised in relation to the general mass and grouping under various aspects.

Yet, how is it possible for an artist, who is convinced that his own conception of beauty is the true one—and without that conscientious conviction he is neither fit to criticise others nor to meddle at all with art—how is such an one, I say, to divest himself of his beliefs, and point out with honesty another road to perfection? Balzac, you will remember, said of the sculptor Steinbock, in "La Cousine Bette," who, bewitched by Madame Marneffe, proved recreant to his art: "Enfin, il passa critique, comme tous les artistes qui mentent à leurs débuts."

Well, sir, I do not wish to accept Disraeli's definition of a critic, as one who has failed in literature and the arts, as a reason for my being here to-night; and the paradox I have suggested above may be left to be argued by more learned casuists than myself.

But with your permission I will, before considering the work of the students, venture a criticism upon that of the sub-committees who have reported upon the drawings submitted for the several prizes. It has been their duty to examine and discuss them in detail—a duty involving long and anxious consideration of the work of each candidate, and one which I know by experience is fulfilled with the greatest care and thoroughness. The reports made to the Council by these committees were placed in my hands for the purposes of this paper, and I was struck by the fact that a great part of their labour is in almost every case lost to the Institute by reason of their referring only to those designs recommended to the Council for distinction. If the respective secretaries were instructed to embody in the reports some notes of their committee's views upon each design which was worthy of serious consideration, the record would be of great value for the instruction and guidance of future competitors. The information, after the edition of confidential matter, might be printed in the Journal, and would be of permanent interest as the considered criticism of men selected for their special knowledge of the subjects dealt with.

I ask your pardon, sir, for this digression, and proceed to the proper subject of my paper.

My task is, on the whole, a pleasant one. The prizes are, except in one case, well contested, and the standard of the work submitted is distinctly above the average. It may be said, for the greater glory of the prize-winners and the encouragement of the unsuccessful, that several competitors who are, alas! in the latter category, would have been in the front rank in any average year.

The Essay Medal.

Taking the Institute silver medals first.

The Essay Medal has brought out six competitors; but I am betraying no secret in saying that the Council is by no means satisfied with the quality of the work offered by candidates for this important prize. Whether it is that the younger men are intimidated by the prospect of competing under an age limit, which is, in my opinion, far too high, and that the older men are unable to find time to enter for it, I cannot say. Certain it is that the literary quality of the essays is by no means what it should be, or what we have a right to expect from the number of well-educated men in our junior ranks. I think myself that the small publicity which attends the gaining of this prize has much to do with it, and that the Council should take some steps to ensure the winner attaining an equal meed of fame with that of his fellow-concurrent for the Measured Drawings Medal, whose work is seen of all men. We must remember that the dearest reward to the artist is the appreciation of his work by his fellow-artists. I dare not inquire how many of us have ever read the work of any Essay prize-man!

The Measured Drawings Medal.

It is with pleasure that I turn to the measured drawings. Messrs. Coombs & Poley well deserve their triumph, and the Council had great satisfaction in awarding the medal to each. The drawings of Christchurch are an excellent and beautiful rendering of a fine subject, and the value of such a study to its delineator is incalculable. I could wish that the small scale drawings had been supplemented by full ½-inch details. The Hampton Court work is shown with a clean expressive line, and the last word would almost seem to have been said as to Wren's work in this building. Mr. Lovell's drawings of Santa Maria dei Miracoli are a careful, useful and thoroughly student-like set. It is to be regretted that he has adopted the practice of "blocking up" the full-size moulding profiles; it gives a misleading double outline and falsifies the contours. A grey wash, or any method which gives a soft instead of a hard line to denote the undefined side of the solid, is of great assistance in appreciating its true form.

"Try" and "Sansovino" send good and conscientious renderings of St. Peter Mancroft, Norwich, and the Library at Venice respectively—excellent subjects, but the drawings not, perhaps, quite up to Silver Medal standard. Two competitors give: one the Grand Trianon and the other the Petit Trianon, but neither quite succeed in expressing the feeling of French Renaissance work; its dainty precision suffers from any want of finish, or coarseness, in drawing. St. Stephen's, Walbrook, is presented by "Reflex," and here again I note a want of that refinement which is essential to the effective delineation of Classic detail.

The Kensington Palace Orangery has attracted several students, and "Wren" shows its details, such as they are, with sympathy. Drawings of the Château de Montmirail, Sarthe, and of Castle Menzies, Aberfeldy, complete the list of works submitted.

I do not propose to pillory those competitors who have not yet arrived at such a degree of proficiency as to place them within measurable distance of this prize by direct criticism of their work. The comparison of their drawings with those of the successful sets will teach them more in ten minutes than they would learn from a lifetime of talk. But I would ask those whom the cap fits to appropriate to themselves certain of the following remarks:—

The choice of a subject is of great importance to the student who proposes to undertake its measurement, for the ultimate object of the enterprise is not the mere preparation of a set of drawings, but that intimate knowledge of and familiarity with the work which can be acquired only by a patient and detailed analysis. It is to this end that the Royal Institute encourages such studies by the offer of its medal. The opportunities which the architect-student has for dissecting the entire anatomy of an important edifice must be limited by the time at his disposal, and this time becomes, in the natural order of things, more and more difficult to obtain as the other duties of his life increase. Few of us can hope to achieve the complete description of more than one or two subjects of the first class, before other claims compel us to restrict our studies to less elaborate memoranda of their essential points. We in

Digitized by Google

Great Britain who desire (and who does not?) to acquaint ourselves with the subtle beauties of Classic art are under the disadvantage of living remote from the great masterpieces of Greece and Rome. We must be content to study them at second-hand by means of books, or must spend time and money in travel that we may see them ourselves. But we have at our very doors a profusion of the most excellent Gothic work that the world can show, and I commend its study to you not only as affording the finest possible technical exercise in draughtsmanship, but as tending to great flexibility and freedom in composition.

I have troubled you with this disquisition because in some cases the subjects illustrated are quite unworthy of the time spent upon them; unless, indeed, as I hope may be the case, they have been measured for discerning patrons who desire the candidates to make "alterations and additions." The mechanical delineation of surfaces of brick wall and repetitions of sash-bars can never give the power that comes by attacking and mastering intricate and beautiful detail; and though I yield to no one in my appreciation of the picturesque qualities of the Renaissance, I hold that, regarded as an aid to the study of Classic architecture, it is somewhat worse than useless.

The Soane Medallion.

We now come to the "Soane Medallion," for which ten designs are submitted. It is the custom, and rightly so, to set great subjects in this competition as pegs for the students to hang their most magnificent ideas upon. Youth attacks heavy problems with a light heart, and Heaven forfend that "the Soane" should ever fall to a set of practicable working drawings. This year a most happy suggestion by Mr. Statham was adopted, and designs were invited for the realisation of the perfect palace described in Bacon's "de Ædificiis."

The result is more than satisfactory, and the winner, Mr. W. S. George, has my hearty congratulations on his fine production. It is imagined in a properly grandiose vein, and executed in a way which indicates artistic qualities of a very high order. The "View" is especially meritorious, showing, as it does, a riotous fancy with an admirable sense of pictorial arrangement. This design is, I think, quite the most learned parody of style which we have had since my brilliant colleague on the Council, Professor Pite, startled us with his ideas as to what a West End club should be like.

Mr. Atkinson, who takes second place, sends a capital set, the plan and detail especially well conceived; but he has somewhat lost sight of that domestic quality which differentiates the palace from the public building. The effective and careful execution of the drawing merits special mention. "Bee" has a good central Vanbrugh-like composition, marred by the restless upper parapet. The author assumes a seventeenth century latitude in spelling, but "Indigo" for "Inigo" Jones would have provoked a mild protest even at that date.

"Regal's" plan lacks imagination, and his treatment is that of an "Hôtel de Ville" rather than a mansion. "Palazzo" sends a design marked by a certain reticence and balance of composition which promises well for future efforts. His perspective, like that of many other competitors, hardly does his design justice, and his plan has another common fault in following the rigid, formal lines of a public institution. The change in his section from the outer court to the arcaded motive required in the fountain court is quite happily managed.

"Peruzzi" deserves a word for his coloured half-inch detail. "Viscount" has a good and suggestive plan, and the detail has many good points; he fails especially in his composition of mass.

"Fraxinelle" has a flexible, clever plan, with a Scoto-French feeling in design. He conveys a distinct sense of size, and his grouping in perspective is good and picturesque. The drawings do not do his work justice.

The Owen Jones Studentship.

Next in order comes the Owen Jones studentship, for which the competition has been very keen. Mr. Gascoyne, who is successful in taking the 100 guineas for foreign travel, gives admirable and delicate renderings of Italian work. His water-colour interiors show a good sense of the pictorial, though not without a certain inclination to a trick effect in lighting, which should be guarded against. Mr. Dawson sends most meritorious drawings, which I really think would have taken the studentship in any ordinary year. Mr. Davies has a remarkably beautiful set. The clean, straightforward drawing and legitimate effects of his sketches are admirable. There is to be remarked, however, a tendency to hot-brown tones in his collected work, which he has emphasised by the warm brown mounts he has adopted. A white or cool grey mount would have cleared and given transparency to his colour. Mr. Nicholson, too, another prize-winner, has not paid sufficient attention to his mounts, a point which it is a great mistake to neglect in a colour competition. His works, which are strong in colour, are so closely juxtaposed as to kill one another, and hardly do themselves justice at first sight. Mr. Jackson, the third of the "bracketed second" men, sends very careful and excellent colour studies of the Santuario at Sorrento and Santa Croce at Florence. They may be cited as examples of what this sort of work should be, and the author's very simple and direct technique is worthy of notice.

The Pugin Studentship.

The "Pugin" drawings next claim our attention, and are in no way below the general standard of excellence. Mr. Drysdale takes the silver medal and 40*l.* prize with delightful and effective sketches well worth study by other competitors. His detail is carefully and conscientiously given without unnecessary repetition. The rendering of Bishop Bridport's tomb, and the John Draper chantry screen at Christchurch, are quite masterly. His combination of brown ink writing with pencil and colour drawing is very pleasant and characteristic; he has done a great deal of good work and thoroughly earned the prize he has gained. Mr. Jordan Green comes a good second with excellent unaffected measured drawings of Abbeydore. Other candidates well to the front are: Mr. Simister, with fine clean pencil studies of Shrewsbury, and other subjects; Mr. George, the winner of the "Soane," who sends a quantity of really useful sketches, including a study of one of the *trumeaux* of Amiens Cathedral west porch; Mr. Morison and Mr. MacLucas, who have each a mass of good conscientious work collected from many sources. Mr. Milne sends capital water-colour sketches and pen-and-ink notes, but wants rather more measured work. The remainder are all quite good, but their sketches, though invariably studious, are a little thin in quality, and in some cases insufficient in quantity. Nevertheless all the twelve competitors are strong enough to have taken a "lot of beating."

The Godwin Bursary.

The Godwin Bursary is next on my list, very worthily won by Mr. Inigo Triggs. I hope I may not be indiscreet in saying that the only doubt in the minds of the Council was whether the proposal of the author to study the "Laying out of public squares and open spaces" fell strictly within the terms of the trust deed. Their decision in the affirmative I awaited with trepidation, and learned with relief, for I fear the suggestion I made in my paper on this subject last year may have influenced the author's choice. I mention this that students may be careful how they adopt any advice of mine in future. Mr. Corbett was placed second out of five concurrents.

The Tite Prize.

For the "Tite" certificate and 40*l.* there are no less than twenty-one competitors, the subject set being "An open-air swimming bath." Mr. Horsnell is placed first with a really fine conception. His plan is thoroughly artistic, and the design is naturally and unaffectedly that of an enclosed space and not of a covered building. The pencil perspective is coarse, and does not adequately express the enclosing of the bath, and the half-inch detail is unfinished. The merits of the design are so great that it is deservedly placed first; but I would warn future competitors that this success is not to be taken as a precedent for unstudentlike finish in their work.

Mr. Pearson takes a medal of merit for a vigorous and good attempt to deal with a difficult elliptic motive. His outer colonnade, though effective, requires more thoughtful planning to justify it, and the entrance blocks occur too abruptly, and do not quite wed with the columnar treatment. The drawings are very admirable. Mr. Wright, who receives an "honourable mention," has a design marked by refinement of detail. His treatment of the projecting staircase blocks shows want of consideration of their side returns, the projections are not in quite good proportion, and the perspective, as is so often the case, rather reveals defects than unsuspected merits. These neglected returns in a façade form fatal traps to those who design in plane geometry instead of cube masses.

"Dolphin No. 2" sends an able and essentially "open-

Digitized by Google

air" design, with a good and effective washed view. His proportions are good, but the detail, which is poor and weakly drawn, must, I imagine, have destroyed his chances with the assessors. Many of the competitors have failed to express this "open-air" motive, and treat their baths as ordinary buildings with the roof removed. Viewed from outside they might be casinos, town halls, or any other public buildings.

"Fiat Lux" sends end elevations which are absolutely ecclesiastic in character, though his treatment of the bath with an open colonnade to the garden is quite excellent. It is a pity he did not develop this suggestion further. "Pleiades" has an ambitious but hardly completed design with many good points, not the least of which is that he has aimed high. "Bo'sun" has a good idea in the terrace-roofing to his colonnade, but his detail is poor and the inter-columniations unpleasant, the voids being too square in form. "Hodden-Gray" sends a design well drawn, but hardly student-like enough in detail. The masonry of the parapets is too heavy, and the central entrance very unsatisfactory as regards the panel over the arch.

"Cui Bono" has a vigorously drawn set showing a really fine sense of massing. The interior is, however, rather "thin" in design, and hardly carries on the solidity of the exterior. The author has destroyed the scale of his perspective by filling in the circular openings with black, which forces them into undue prominence, and is fatal to all suggestion of aërial perspective. I mention this design for its merits, but it is clearly disqualified as not complying with the conditions of the competition. "Seed," "1905," and "Aqua," with a Palladian design of merit, all deserve mention. "Aristobulus" fails in the treatment of his internal angles and rounded seats. "Ajax" shows some good composition in his section, but the whole design is slovenly in execution. "E pluribus meum," "Michel-Ange," and "Ultra" show some promise; the first fails in scale, the second is lacking in imaginative quality, and the flat domes of the third require more apparent solid support.

The Arthur Cates Prize.

The Arthur Cates prize of forty guineas has produced only one competitor, and Mr. Markham, to whom it falls, has thoroughly earned it by honest and good work. It is curious that this prize has not attracted more attention, as a great part of work required is already done by every candidate who passes the final examination at the first attempt.

Grissell Medal.

The Grissell Gold Medal and ten guineas is given this year for the best design for a stone skew bridge. The prize is awarded to Mr. Nott, for an excellent and simple scheme thoroughly well worked out. His design for the pylon piers would be better if the niches and brackets in the lower portion were omitted. The upper parts are too thin in proportion, and rather slab-like when viewed from the side.

Although this prize is primarily one for construction rather than for beauty of design, it must not be forgotten that construction which results in unlovely form is architurally bad.

"Bydand" gives an elaborate Italian design with extensive abutments. The remaining designs show much meritorious, though, I fear, misdirected work.

Ladies and Gentlemen,—Here is the younger generation knocking at the door, as Ibsen says; and we hear their vigorous strokes for the prizes of the year without any of Halvard Solness' misgivings. The better the students' work the better is the prospect for British architecture; and we welcome all such as are worthy within our portals. I offer my congratulations to the Royal Institute upon its students, and to the students upon their fine performances, commending to them Ben Jonson's description of "The True Artificer":—

He knows it is his only art, so to carry it as none but artificers perceive it.

The President then distributed the prizes; a list of the successful competitors was published in *The Architect* of January 26.

Address to Students.

I propose to put before you this evening a few suggestions as to the methods—or rather, I should say, method—of constructive thought in design. As a matter of fact, there is only one such method for any artist, whatever be the vehicle he choose to work in. The arts are all closely allied—at any rate in their methods—and the order of thought-development in each is one and the same. My friend Albert Gilbert, the sculptor, once insisted that there was another way, called the "fluke," and that he was sure from his observation a great many more designs were produced in that than in any other way. But surely this must be a libel. I won't venture on the statement that I have had no experience of that sort, but I am not anxious to talk about it, and it wouldn't help you if I did. For the one thing the youthful aspirant needs most to have rubbed into him—in season and out of season, if necessary—is that without hard study and adequate thought he will never do anything really good.

The intelligent study of mental processes in design, and the knowledge of the order of thought to be observed, is not unimportant; for, though many follow this order instinctively and unconsciously, yet, seeing that our mental faculties are our armoury, it is good to know what weapons we have at our command, and how and when to employ them. I am not a philosopher—not even a psychologist; but I have observed and analysed mental processes both in myself and others; I have also gathered light from the analogy that exists in the arts generally—and so I hope that I may be able to say something on this point that will help you in your work. First of all, then, and as a preliminary, a suitable environment must be found. Not necessarily a literal environment of persons, places, and things, but, at any rate, of thought and mood. Environment is nowadays more a matter of character and temperament than of locality. Whithersoever a man betake himself, it needs powers of self-government and mental concentration to escape the insistent shouts of commercialism and the prosaic business claims which are so apt to usurp an undue share of our attention. Yet, if the imagination is to be free for visions of beauty or even of dignity, if thought is to rise to the expression of noble purpose, the soul of the man must be able to take flight on occasion into the "serene" of the summer sky, leaving the earth and its cares to look after themselves for a time. Psychologists tell us that moral education is dwarfed, or even impossible, unless a man has a certain amount of leisure time for the free play of his moral faculties. Certainly, too, the soul of the artist will perish within him unless he learn to withdraw himself at will into the higher realms of imaginative vision, where no sordid purpose or ignoble thought can live. Given the right conditions, we may now proceed to analyse the working of thought in design. Let us remember, in the first place, that architecture "speaks." The power of speech—the noblest of gifts to man—is seen in all true art. In language words are symbols, and by their combination into sentences thought is conveyed, the punctuation of such sentences into primary and subordinate clauses, together with other qualities of proportion and rhythm, determining the value and relation of the several ideas expressed therein. Exactly the same in architecture—forms are combined to appeal to the imagination and express purpose. One form of opening in a wall will convey the idea of ingress or egress, another the means of looking out or receiving light. This may be called the "simple sentence," or, if you like, the prose statement of architecture; but when we proceed to the higher forms of combination, to the moulding of these symbolic forms into sequences and rhythmic order, then we begin both to express and to appeal to the higher kind of poetical and imaginative thought. The same laws or principles hold good for the work of the painter and sculptor, both these arts in their higher qualities possessing the power of conveying to and impressing upon the imagination much more than they actually portray. In music we have the most ethereal medium for speaking to the heart of man. Just as poetry can convey more than prose, just as there are musical sounds too high-pitched for the ear of man to catch them, so there are thoughts and emotions "too deep for words," for which music provides the only adequate vehicle of expression. Architecture has been termed "frozen music." Like both music and poetry, it is subjective in its appeal, for the same arrangement of lines and colours will suggest fifty different things to fifty different persons. A fine and imaginative work will reveal to each individual some vein or mood of his own, and this above and beyond what was actually present in the mind and purpose of the architect. Every true work of art possesses an inherent energy which will sway the imagination of others and discover to them meanings of which the artist himself is unconscious. The imagination, then, must be allowed a definite place, both in the production of a design and in that reflection which it induces in the beholder.

A good design usually has a definite origin in a germ

Digitized by Google

idea, from which, as from a bud unfolding itself, must be slowly and patiently evolved the true position and relation of the several objects and parts. In connection with this process of evolution it is worth noting that in architecture as in language the most powerful effects are sometimes gained by the simplest means. That statement is strongest which is given in fewest words—provided the words be adequate and suitable. Why? Because the mind is quicker than the lips; because the imagination can picture more rapidly than words can paint. So in our art there are occasions when the dignified and simple statement is not only the most appropriate, but also the most effective. Not that this kind of statement affords a ready escape from toil; dignity and simplicity come with experience and thought. An essential element in the production of a design—whatever the idea and purpose of the work—is "feeling," by which either sympathy or repugnance is called into play. It is by feeling that an architect makes his selection and develops and encourages definite tastes of his own. Feeling is his own private artistic assessor, to judge in the competition of the many ideas and suggestions that present themselves before his mind's eye, as it were. In the projection of a design on paper mental perspective plays an important part. Projected, as it is, on a plane surface, the relative distances of the several parts of a design can only be distinguished and appreciated at their proper value by an effort of thought. Time was, as you are doubtless well aware, when designs were produced in a kind of geometric perspective, that the author might see all round his subject; now we do this mentally or by developing each side simultaneously. During the whole process of development and selection the purpose of the work must be kept constantly in view, with the object of bringing out in stronger relief every feature and detail by which this purpose is to be conveyed. The first "idea" relating to the purpose brings with it resemblances which stimulate the imagination. The interest thus awakened, backed by knowledge, provokes to further effort, in which original thought is both checked and stimulated by association and comparison, memory and imagination acting and reacting on one another—both of them under the control of knowledge and recognised principles. The expansion of the initial thought will resemble the circling ripples produced by the stone thrown into still water—every advance leading on to some fresh development, some more extended idea. With these expanding thoughts enter other considerations, such as questions of material and proportion of parts to the whole. Secondary causes also claim our attention as we proceed—viz. incidental local features and surroundings, contrasts, ornamentation, colour, texture, &c. These are the means which the thought of the designer marshals and controls to give expression to such intangible qualities as purpose, character, manner and disposition.

Architecture furnishes posterity—unconsciously, perhaps—with a picture of the prevailing manners, customs and conditions of life. More than that, it reveals, or, it may be, betrays, the emotions and sentiments which have made each age famous or notorious. There are thoughts formulated ages ago which, having found expression in the work of the architect, are living forces to-day. The student should be impressed with his responsibility, and so systematise his thoughts as that his work may be a fitting and representative expression of the best thought of his day; for if he suffer his work to be infected with the haste and self-assertive methods of modern life, these are bound to betray themselves in every line and detail of his design. There is something much more subtle and mysterious in an architectural work than a mere orderly arrangement of materials. There is life and speech in it. If a man's character may be read in his hand, certainly it may in his handiwork. The life may be noxious, like that of a poisonous plant, or sweet and beautiful like that of a flower; or, again, it may resemble that of a noble tree—but life there is. The speech may be that of a Shelley or a Milton, or, on the other hand, of the most blatant type of "yellow" journal, but speak the architect's work must and will. It has a music, too, of its own, whether it be the music of one of Beethoven's sonatas or of the latest comic song. When you realise this—and no one can be indeed an architect who does not realise it more or less—you will approach your work with that due sense of its dignity and importance in which alone you will be able to rise to the "height of the (proposed) argument"—if I may adapt one of Milton's phrases to my own purpose. A clear perception of the possibilities both of good and of evil that open before us when work is entrusted to us—in other words, a proper feeling of reverence for our task—is indispensable if we would accomplish something noble or beautiful, or even suited to its purpose.

If an architect is to speak truly—indeed, if he is to be coherent in his message—he must follow the recognised forms, the articulate phrasing, the grammatical order proper to his art. Thought-symbols, of whatever kind, are arranged in groups of rhythmic form like musical phrases in relative keys. In architectural design this is effected by divisional lines and grouping of parts, such divisions being regulated on principles akin to those which govern musical progression and a harmony built up of sounds. Again, contrasts are obtained in music by the use of loud and soft passages, and effects by gradations of sound from pianissimo and fortissimo. So architecture makes use of "strength of tone," gradations being secured in this case by the measure or greatness of projections of the different parts; also by the varying plainness or delicacy of surface and detail. I will not carry these analogies and definitions farther. What I have already said is sufficient, I hope, to convince you that there are laws and principles governing good architecture, and that as nobody expects a harmony from a haphazard arrangement of musical notes, so neither will you do good work in your profession by chance combinations of random methods. We have now come to a point when we can, indeed, analyse no further; for there is always an element of mystery in the best architecture—a sort of haunting personality that, ghostlike, vanishes just when we think we have it in our grasp. This quality of "mystery"—so pre-eminent in Oriental buildings—is one to conjure with. Veiled under symbolic forms which hide as much as they reveal, it continually draws us on and as continually eludes us. The screening of parts provokes the mind to search further and deeper for that which is beyond the immediate range of vision. Given the element of mystery—which is perhaps the "personal equation" of art—none but the trained mind can make effective use of it. The personal element is of little avail if we have not painstakingly learnt the methods and principles of our handicraft.

One of the commonest of pitfalls for youthful designers lies in certain fanciful ideas of originality. It is easy enough to be original after a fashion. Any mere novelty will serve to astonish or startle; but if we wish to appeal to the higher faculties we must be content to let our originality find expression within the lines on which those faculties themselves work. The great German poet Goethe relates it as perhaps the greatest lesson of his early manhood—a sort of discovery that he made for himself apparently—that if he would "find himself" and enter upon his inheritance he must recognise and submit to limitations. Originality does not involve a subversion of all that is orderly. In music the gamut remains the same for one man as for another; certain combinations of sounds are pleasing, certain others displeasing, and will not change their character for anybody. So the architect can neither create new elements nor alter the emotional effects of combinations of elements; his hope lies in so training his powers of perception as that he can move freely and with a sure tread amongst the almost infinite variety of paths that open before him. Then he will find plenty of scope for originality without violating the canons of art or wandering into the realms of the unpleasing. Sir Joshua Reynolds considered that "excellence is the direct result of trained perceptions." Certainly such perceptions are the foundation; any special powers or qualities that a young architect may be conscious of will find their place and expression at a later stage. You may rest assured they will not be thrust out or obscured; they will only shine all the more brightly for having submitted to limitations. As I have said before, the character and mind of the designer will always reveal themselves in his work. The scholarly treatment of one man will appeal to the intellect, while the grace and charm which distinguish another's work will rather sway the affections. The highest achievement, seen only at rare intervals, lies in a combination of qualities well balanced and under absolute control.

I have endeavoured this evening to show you that there is a certain order and development of thought in the evolution of a design. Mere knowledge will not suffice. Something more is needed than a reproduction of the past or a mere application of mathematical formulæ. If a student labour with but little thought he may attain to a dazzling skill, but he will neither stir the heart nor convince the mind. The search for the ideal lies ever upwards and on-

wards by the way of severe mental discipline. Let us remember, in the words of Philip James Bailey :—

> We live in deeds, not years ; in thoughts, not breaths ;
> In feelings, not in figures on a dial.
> We do not live by heart-throbs ; he lives most
> Who feels most, thinks the noblest, acts the best.

Mr. EDMUND GOSSE, in proposing a vote of thanks to the President, said it seemed to him that the whole world as regarded architecture was divided into three very unequal divisions. There was the enormous majority of persons who knew nothing about the art at all, and who did not know a good building from a bad one ; there was the small and important division who had a great taste and love for architecture, but without practical knowledge of it ; and then there was the body consisting of the Fellows, Associates and students of the Institute who knew everything about architecture. The keynote of the paper was sounded in the words that made them realise that order in the development of thought in the evolution of a design was the central ambition which an architectural student should hold before him, while he should always aim at purity, dignity and freshness of design, without giving way to being incongruous and fantastic in his work. They lived in an age when the incongruous and fantastic were popular, and it was a matter of congratulation that architecture could not go into those realms of fantasy. Much of the work which they saw about them was of an entirely dead order ; but the Institute, with the President at its head, was making a very difficult and dangerous fight against the universal poverty of design. There was a great deal of work to be done in the development of public taste, because most of it was bad, but in spite of all sorts of difficulties and discouragements, the architects were continuing their efforts for a truer appreciation of their art among the people.

Professor F. M. SIMPSON seconded the vote of thanks, and emphasised the point made in the address that without hard study and adequate thought no student in architecture could hope for success. Architecture could be said to speak, and according to the way in which it spoke one could determine the character of the man who made the design. There was an old quotation that the good that a man does lives after him. In the practice of architecture there was something more than that, for the bad work survived as well as the good. It was by the amount of good work that they could judge an architect's character. The best expression of Cockerell's refinement, scholarly skill, and, above all, the depth of his youthful studies was to be found in his work, but the knowledge that gave him his power was gained long before he achieved success. In conclusion, the speaker said he thought all present, and especially the younger members of the profession, would feel grateful to the President for the address, wherein he had laid stress upon the value of cultivating the imagination in order to conceive, and the importance of knowledge to help them to work out their ideas.

The President, in bringing the evening to a close, said that at a special meeting to be held on February 20 the following resolution would be moved :—"That the Institute do purchase the freehold site between Nos. 11-13 Portland Place, London, at the price of 19,500*l.*, and do erect thereon a building to include the offices and hall of the Institute, at a total cost including the purchase of the said site, and for the erection of the said building, and that the Council be authorised to raise by the sale of stock belonging to the Institute, and by mortgage of the said site and building on terms to be approved by the Council, such money not exceeding in the aggregate the sum of 53,000*l.* as may be necessary for the purpose of the purchase of the site and the erection of the building."

IRON AND STEEL ROOFS.

A PAPER was read before the Manchester University Engineering Society on January 31 by Mr. W. Noble Twelvetrees, M.I.Mech.E., &c., on "The Charing Cross Disaster and the Safety of Iron and Steel Roofs." After describing the accident at length, the author treated of the conclusions suggested by the failure. He said :—

Among the more important of the points suggested by the foregoing discussion of the Charing Cross roof failure are the following :

1. That welded tie-bars, made in the days of wrought iron and still remaining in large roof structures, should be supplemented, especially if not in duplicate, by auxiliary tension members. The most convenient manner of applying such reinforcement will probably be found in the employment of steel cables, as adopted by Sir Benjamin Baker in the case of the Crystal Palace roof, and later from end to end of the principals in the Charing Cross Station roof.

2. That the connections between the main members and the bracing of roof structures should be as secure as possible.

3. That wind screens should be designed so as to provide that such structures shall not have the effect of decreasing the safety of the roof.

4. That the practice of mounting large roof principals upon lofty walls, and especially when the level of the site is such that the height of the walls is further increased by the substructure as at Charing Cross, involves risks of so serious a character in the event of unforeseen failure as to make this type of design extremely undesirable.

A suggestion not arising directly out of the Charing Cross failure is that the imposition of roof trusses upon exceedingly lofty supports renders inspection and maintenance unnecessarily difficult and costly. Owing to this feature, it is by no means improbable that the Charing Cross and Cannon Street Station roofs have not received the same amount of attention that would have been accorded had they been situated at lower levels. The author does not for a moment mean to imply that these roofs have been neglected. The Cannon Street roof has recently been thoroughly overhauled, and there is ample evidence to show that, since his appointment in 1899 as chief engineer to the South-Eastern & Chatham Railway, Mr. Tempest has been particularly careful to satisfy himself that the Charing Cross roof was properly maintained.

Of course after more than forty years of existence it is only natural that the metal should have been diminished in thickness by the effects of corrosion, and this is in itself a sufficient reason for a radical departure from some forms of design that have prevailed from the early days of iron roof construction, almost up to the present date. Most of the railway station roofs built since the middle of last century are representatives of the two great orders of truss construction and arch construction. Some designers have preferred one type and some the other, but there has been a general agreement as to the necessity for building spans of great width so as to provide unobstructed space for the requirements of traffic managers.

Roofs of the Charing Cross Type.

The roof of New Street Station, Birmingham, with a maximum span of 212 feet, may be regarded as the prototype of what is here termed the Charing Cross type. The Birmingham roof, designed in 1851 by Messrs. Fox & Henderson with the assistance of the late Mr. R. M. Ordish, is a magnificent specimen of early engineering skill in serviceable condition. About the same time Mr. Berkeley built the Fenchurch Street Station roof, with the span of 106 feet, and presenting the praiseworthy feature of duplicate tie-bars. Charing Cross and Cannon Street Stations followed in quick succession, and among other well-known examples of kindred design may be mentioned the roofs of London Bridge Station (L.B. & S.C.R.), Blackfriars Station, London, and Lime Street Station, Liverpool. Two of these roofs are worthy of special remark, for the reason that the main tension members were duplicated. The Blackfriars Station roof, now taken down, was of excellent design, and the employment of duplicate tie-bars gave that element of security which is so much to be desired. The extension of the Lime Street Station roof, completed in 1875, has a span of 191 feet, and is a very fine example of practical construction which it would be difficult to improve upon in the present day. Apart from its other meritorious features, the roof is quite safe from any accident such as that which overtook the unfortunate structure at Charing Cross, as with four solid-forged links in each length of the main tie, one or two bars in every length might break without involving the collapse of the roof. Another form of design generally resembling that adopted at Charing Cross, although differing in points of detail, is represented by the roofs of Victoria Station (S.E. & C.R.), London, the Central Station, Liverpool, and Queen Street Station, Glasgow. But in these three roofs single tie-bars are relied upon to take the thrust of the principals, which, in view of the fact that the spans measure 129 feet, 160 feet, and 170 feet respectively, cannot be regarded as a satisfactory feature.

The foregoing are only a few of the numerous roofs that have been built in the United Kingdom of design similar to

Digitized by Google

that of the Charing Cross roof, and it is a significant and reassuring circumstance that the latter is the only structure of the kind that has developed any serious defect.

Arched Roofs.

The Paddington terminus, London, may be mentioned as the first railway station to be covered by wide and lofty spans not requiring the employment of tie-bars. The roof was built from the designs of Brunel about 1856, and includes three arches, a central span of 103 feet 6 inches, and two side spans of 70 feet and 68 feet respectively. King's Cross Station, London, was really the first railway station to be arched over, but the original structure consisted of timber ribs. These were erected in 1851, but the two spans have been replaced by wrought-iron ribs of similar design in 1869 and 1887 respectively.

St. Pancras Station, London, built in 1867 under the direction of Mr. W. H. Barlow, F.R.S., from the designs of Mr. R. M. Ordish, represents a type that may be considered as arch or girder construction according as the thrust of the main rib is resisted by abutments or by horizontal ties. At St. Pancras the clear span of the roof is 240 feet, and the ribs are connected by horizontal ties below rail level, but the thrust is almost entirely resisted by the abutments. Two noteworthy examples of similar design in America are the roofs of the Pennsylvania railroad station, Pittsburg, erected in 1902, and the Baltimore Armoury, built in 1904. The former structure has a span of 255 feet, a height of 110 feet, and is of the three-hinged type, the ends of the main ribs being connected by horizontal ties between the ends of the main ribs.

It is interesting to note that when the ribs of a roof such as these are adequately tied the whole construction really constitutes a bowstring girder of gigantic proportions, and when applied to a railway station the public are actually inside the girders and walk with perfect safety upon the bottom chords which rest upon solid ground, instead of being at the mercy of girders mounted high above their heads on lofty walls, as in stations of the Charing Cross and some other types.

St. Enoch's Station, Glasgow, with a span of 198 feet, and the Central Station, Manchester, with a span of 210 feet, are fine examples of similar construction, except that they are built as genuine arches, in which the thrust is resisted entirely by the abutments.

While referring to arched roofs of wide span, the roof of Olympia in London should be mentioned as the finest example of the type in which the main arch, with the span of 170 feet, and two side arches, each of 40 feet span, are connected so that the whole forms a compound structure. This roof was built in 1887 from the designs of Mr. A. T. Walmisley and Mr. Max Am Ende as joint engineers. The manner in which the horizontal thrust of the arch and the horizontal wind pressure are taken up is distinctly novel. The whole of the gallery on each side acts as an abutment, and as the columns are fitted with ball and socket joints at top and bottom, these members are always under axial load, whatever may be the wind pressure or the irregularity of the gallery loads.

Arched roofs such as those mentioned above certainly represent the safest forms of construction for long-span roofs, because their stability does not depend upon the strength of a single tie-bar, or even upon ties in duplicate. They afford ample space for traffic without intermediate supports, and the chief objection to their employment is the heavy cost involved in construction.

Roofs of Composite Type.

To secure unobstructed space in railway stations at the lowest possible cost is a problem that has exercised engineers for many years past. One of the most successful attempts in this direction was made more than forty years by Mr. Jacomb Hood when designing the roof of the Victoria terminus of the London, Brighton and South Coast Railway, where continuous girders, extending from side to side of the station with one line of intermediate columns, support small roof trusses of the queen-rod type. The use of girders in this manner makes it possible to place the supporting columns wherever they may be most convenient, and free from the risk of injury from derailed rolling-stock.

Two stations in Glasgow are spanned in a somewhat similar manner by deep latticed girders, the more remarkable of these being the Central Station, where the transverse girders are 213 feet long by 20 feet deep, and carry ten ridge and furrow roofs of 35 feet span. Apart from their other advantages roofs of this character do not involve great risks, for the failure of the tie-bar or any other member in one principal of a small span would not be followed by serious consequences, and, possibly, would not even cause the failure of the truss affected.

Recent Types of Roof Design.

Indications are not wanting in the present day that the fashion for monumental roofs is distinctly on the wane, so far as railway stations are concerned. In several of the most recent designs for such roofs small spans have been adopted, and it is probable that the tendency to reduce initial expenditure, and the disadvantages of huge spans, will finally lead to the practice of simply covering the station platforms, leaving openings above the lines for the free escape of steam and other destructive gases from locomotive engines.

The roof of Marylebone Station, London, is a good example of modern steel construction. The platforms, lines, and promenade are covered with light steel roofing, carried by built-up stanchions and arched girders of the Linville type. The total width of the roof is 155 feet, made up of two trussed spans of 50 feet and 40 feet respectively, and a 15-foot cantilever span. This roof is of unpretentious character, and, owing to the elegance of its construction and the absence of high side walls, renders the station one of the most cheerful and best lighted in the metropolis.

The new roof under construction in connection with the extensive widening operations at Victoria Station (L.B. & S.C.R.), London, is an admirable illustration of sound engineering design, complying alike with the requirements of traffic and the safety of the public. The total width covered, from Buckingham Palace Road to the South Eastern and Chatham Railway, is about 320 feet, the roof being divided into five spans of varying width and height. The main principals are spaced 16 feet 8 inches apart ; every third principal is carried on one of a series of cast-iron columns, spaced 50 feet apart, and the others on latticed girders connecting the columns, the latter being arranged along the centre lines of the platforms, where they are safe from accidental injury. The following are typical dimensions of the chief members of the roof trusses :— The main rafters are formed of two 18-inch by 3-inch channel-bars ; the main tie-bar consists of two 6-inch by 3-inch tee-bars in each end length, and two $4\frac{1}{2}$-inch by $\frac{1}{2}$-inch flat bars in the centre length ; in the bracing the struts consist of channel and angle bars of different dimensions, single or duplicate according to position ; the ties are flat bars of different dimensions, single or duplicate according to positions, and the vertical tie in the centre is a $1\frac{1}{4}$-inch diameter eye-bar provided with a screwed turnbuckle for purposes of adjustment. This roof is being erected from the designs of Mr. Charles L. Morgan, M.Inst.C.E., to whom the author is indebted for the foregoing particulars.

A design presenting features of decided novelty is that prepared for the Marine Station, Dover, in connection with the proposed widening of the Admiralty pier, to provide adequate accommodation for the increasing Continental traffic of the port. The station is to be 800 feet long by 200 feet wide. Three rows of cast-iron columns, spaced 26 feet apart centre to centre, carry the roof structure, the outer rows each supporting one end of the transverse lattice girders, with the span of 100 feet, which meet at the centre row of columns placed in the middle of a platform 60 feet wide. These girders are 10 feet deep, and are divided by vertical struts into panels 10 feet wide, having a double system of diagonal ties, the height from rail-level to the underside of the girders being 20 feet. The columns are continued above the bearings of the girders and incorporated into the ironwork of the double cantilever roof principals, which form 25-foot roof spans, and somewhat resemble the cantilevers of the Forth Bridge in outline. The cantilever arms project 12 feet 6 inches, and their ends carry the roof gutters, which discharge through the centre row of cast-iron columns. One side of each roof ridge is covered with sheet copper laid over felt and boarding, and the other side is glazed. All the purlins are of timber, a material selected instead of iron owing to its immunity from injury by the steam and gases emitted from locomotives ; and for the same reason wrought iron was specified instead of mild steel for the roofwork generally. The new Marine Station was designed for the Dover Harbour Board by Mr. A. T. Walmisley, M.Inst.C.E., by whom particulars and drawings have been furnished for the purposes of this paper.

The three types of design described above are sufficient to demonstrate the reaction that has set in against roof

Digitized by Google

spans of exceedingly large proportions, and the drawings for the new station at Charing Cross serve to emphasise the same characteristic.

On the recommendation of Mr. Percy Tempest and their consulting engineers, the railway company decided in December last to remove the existing Charing Cross roof, and to substitute a new roof of modern type at a lower level, and the work of demolition is now nearing completion The new roof is designed on the ridge and furrow system, the ridges running at right angles across the station; the principals will be carried by latticed girders extending from side to side of the station, and these girders will be supported by the lowered side walls and by two lines of columns placed in the middle of the platforms. The total height of the roof will not be more than about 35 feet to 40 feet above rail-level, and as the side wall will be considerably reduced in height, abundant provision will be made for the admission of light, to say nothing of the other manifest advantages of the new structure.

Mr. Tempest's reason for adopting this type of design was that it will be possible to construct the transverse girders in such a way that the columns may be moved within reasonable limits to suit any rearrangement of the platforms that may become necessary, and thus to save any alteration to the structure of the roof in case widenings should be undertaken on either side of the present station. At the same time, the new roof will conduce to the safety of the public, and give increased facilities for maintenance, for the direct escape of steam and corrosive gases, and for the dispersion of sound waves.

Preservation of Iron and Steel.

In conclusion, the author desires to point to the fact that however much the design of iron and steel roofs may be improved, the question of corrosion will always have to be faced. No form of paint or other protective coating has been discovered that will effectively shield metal from the chemical action taking place in the presence of oxygen, moisture and acid. Exhaustive investigations conducted by the Pennsylvania Railroad Company upon some fifty different preparations, including forms of asphaltum, india-rubber, graphite, carbon, lead and iron oxide paints, have proved that not one of these could preserve steelwork from rust for more than twelve months.

These investigations also confirmed the facts that no known form of paint is impervious to air, and that in the case of steelwork exposed to smoke and gases, corrosion commences behind the paint, and not from the front after disintegration of the surface. It may be mentioned that ample evidence of the latter effect was furnished by the fallen ironwork at Charing Cross Station.

The proposal has recently been made by Mr. B. H. Thwaite that the application of Dr. Angus Smith's compound would effectually protect iron and steel from the effects of corrosion. As water pipes coated with this material are immune from attack, especially by water containing vegetable acids, it is somewhat doubtful whether metal under far more disadvantageous conditions would fare any better.

Sir Benjamin Baker has recently stated the difficulty of this point very clearly, saying that the trouble in railway stations arises from the gases emitted by engines, and the impossibility of getting paint to stick on. He added that no material had yet been invented to protect iron so as to enable it to resist corrosive action.

Nevertheless, it is a well-known fact that Portland cement of good quality, properly applied, is an absolute preservative for iron and steel. This points clearly to the advantages to be derived from the employment of concrete-steel, especially in railway station roofs. The material in question has been used in the United States for the construction of roof principals in spans up to 100 feet, and in this country for arched beams up to 54-feet span. Hence it is perfectly clear that railway station roofs, together with their supporting columns, could easily be built of reinforced concrete, which, as demonstrated by numerous examples of bridge construction, lends itself to light and elegant types of design, capable of enduring for centuries with practically no attention or expense in the way of maintenance.

This is the final point suggested to the author by the Charing Cross roof, not by the failure, but by the corroded condition of the fallen ironwork, which, although not worse than that of many other structures, was sufficiently marked to constitute a powerful argument in favour of a material of construction that is unaffected by climatic and other corrosive influences.

Correspondence

Assumption of the Letters "F.S.A."

SIR,—My attention has been called to the fact that a drawing of a house near Cambridge, published in your issue of 2nd inst., is both signed and lettered "H. Steward Watling, F.S.A."

As Mr. Watling is not a Fellow of the Society of Antiquaries of London, he is clearly not entitled to append to his name initials which custom and courtesy have long recognised as denoting Fellowship of that Society.

W. H. ST. JOHN HOPE,
Soc. Antiq. Lond., Assistant Secretary.
Burlington House, London, W.

An Aisleless Church.

SIR,—It is desired to erect a church to seat 500 without any pillars in the church. Can any of your readers oblige me by telling me of any such church in the immediate neighbourhood of London?—Your obedient servant,

JNO. MACKRELL.
High Trees, Clapham Common, S.W.:
February 5, 1906.

Repairing Buildings.

SIR,—Having regard to the serious depression now existing in the London building trade, and the large number of men connected with it who are at present out of employment, may I be allowed to suggest to those property owners who are able to afford the expense that the most effectual way of relieving the prevailing distress is to put in hand all necessary repairs, painting, &c., with as little delay as possible. It needs no argument of mine to prove that money spent in this way does far more good than much larger sums given in the form of charity or as subscriptions to funds for the relief of the unemployed. One cannot go about London without being struck with the state of disrepair into which so many houses are allowed to fall. If only a tithe of the work that is required were undertaken very much of the distress that at present exists would quickly disappear.

I ought perhaps to add that I have no personal interest in the building trade, either direct or indirect.—Yours faithfully,

JOHN PRICE NEWTON.
189 Essex Road, Islington,
February 7, 1906.

GENERAL.

Mr. G. H. Willoughby, of Manchester, has been appointed assessor by the Crompton District Council in connection with the Carnegie Free Library, for which about fifty sets of drawings have been submitted by architects in open competition.

The Lectures on "Reason in Architecture," which Mr. T. G. Jackson, R.A., is delivering at the Royal Academy, are in the press, and will shortly be published by Mr. John Murray.

Mr. R. Pearson Brereton, who died on January 2 at Oundle, has left his manuscript works on Northamptonshire churches and photographs to the MS. department of the British Museum; all his photographic negatives of churches and details of ecclesiastical architecture to the National Photographic Record Association; his manuscript notes and photographs of the church towers of Somerset to the MS. department of the British Museum; and a complete set of collotype reproductions of these notes and photographs to be bound and lettered in gilt "Somerset Church Towers," and presented to each of the following:—(1) The Somerset Archæological Society, at Taunton Castle; (2) the Northampton Archæological Society, Northampton; (3) the British Museum; (4) the National Photographic Record Association.

The Foundation-stones of the free library, public offices and assembly hall were laid on January 31 at Ilkley; that of the public offices and hall by Mr. J. T. Jackson, the chairman of the committee, and that of the free library by Mr. Dixon, chairman of the Urban District Council. A silver trowel was presented to Mr. Jackson by the architect, Mr. William Bakewell, and a trowel was presented to Mr. Dixon by Mr. G. Smith on behalf of the contractors.

The Court of Common Council have agreed that, in consequence of the death of Mr. H. H. Collins, the dangerous structure inspector for the eastern and southern divisions of the City, Mr. Edmund Woodthorpe (the present surveyor for the northern division) should be appointed to act as surveyor for the eastern division, and Mr. M. L. Saunders (the present surveyor for the western division) should be appointed to act as surveyor for the southern division.

The Herts County Council have taken over Queen Eleanor's Cross at Waltham for preservation as a national memorial.

The Design of Messrs. Speir & Beavan, architects and surveyors, Cardiff, has been selected for the new free library at Pontypool.

Mr. Turner, assistant surveyor to the Bethnal Green Borough Council, has been called to the Bar. The Council, in accepting Mr. Turner's resignation, congratulated him on the distinction.

The Liverpool City School of Art, having now passed under the control of the Municipal Education Committee, have been afforded the privilege of holding its annual exhibition of the work of the students within the walls of the Corporation Walker Art Gallery. The exhibition occupies three of the large rooms usually devoted to the autumn exhibition of pictures. There are over fifty specimens of sculpture.

A Public Presentation was recently made to Professor Antonio Fradeletto, in recognition of his services as secretary of the International Exhibition at Venice. The committee selected the bronze entitled "Leda," by Mr. F. Derwent Wood, which was exhibited at the International Society's exhibition at the New Gallery two years ago.

The Council of the American Institute of Architects for the present year will consist of president, Frank Miles Day; first vice-president, Cass Gilbert; second vice-president, William B. Mundie; secretary and treasurer, Glenn Brown; directors, Alfred Stone, Irving Kay Pond, Ralph Adams Cram, Merritt J. Reid; auditors, J. G. Hill, Robert Stead.

Sir W. W. Wynn has lent his house, 20 St. James's Square, for an afternoon party on the 20th inst., which is being organised by some members of the British Association who were in South Africa last year, where many of the best photographs they took and the collection of curios they brought home will be exhibited. The object is to assist the funds of the South African Colonisation Society. The house was built in 1772 from designs by Robert Adam, and the old decorations by Angelica Kauffmann and other artists of that date are almost intact.

The Parishioners of Gayton Parish Church, Northamptonshire, have decided in favour of rebuilding the upper portion of the church tower. The cost is estimated at about 800*l.* Mr. M. H. Holding is acting as consulting architect. It was stated that in 1726 the top part of the tower was raised and bells were put up, but no builder or architect was employed, the then rector and churchwarden and others carrying out the work at a total cost of about 200*l.*

The Athy Urban District Council have appointed Mr. James F. Reade, A.M.I.C.E., of Westminster, their engineer, to prepare plans, &c., and carry out his scheme for the water supply of the town and suburbs, which was awarded first prize in the competition held some years ago. The Council have given the matter very full consideration.

The Society of Architects will hold the fourth ordinary general meeting for the session 1905-6 at Staple Inn Buildings, Holborn, on next Thursday evening, when the gold medal of the Society will be presented to Mr. Walter W. Thomas, J.P., past president. Mr. Ellis Marsland will read a paper on "The Architecture of the Cotswolds, Sixteenth and Seventeenth Centuries." Ladies are specially invited to this meeting.

A Paper on "Small Water Supplies" will be read by Mr. C. H. Shenton at the meeting of the Association of Engineers in Charge, St. Bride's Institute, on Wednesday next.

Mr. T. C. Horsfall has presented to the Manchester Art Gallery the study for *The Court of Death*, by the late Mr. G. F. Watts, as well as a copy of Raphael's *Madonna del' Cardellino.*

The Edinburgh Town Council at last week's meeting allowed to lie on the table a memorial from the Edinburgh Architectural Association with regard to the disposal of the city's architectural work.

The Discussion on the paper by Mr. Marshall, K.C., on the "Valuation of Machinery for Rating Purposes," will be resumed at the Surveyors' Institution on Monday evening.

An Offer from the Bishop Ryle Memorial Committee of 500*l.* for the erection of a memorial in the new Liverpool Cathedral to the late Bishop Ryle has been accepted, the suggested form being that of a recumbent marble effigy.

The Leith Town Council are endeavouring to organise a municipal museum with its abode in one of the recently renovated committee-rooms of the town hall, situated at 35 Charlotte Street, Leith.

Prizes having been offered by the British Fire Prevention Committee for fables for children respecting the danger of playing with fire, 286 fables and stories were sent in, and the medals and money have been awarded.

The Worcester City Council were informed on Tuesday that the Royal Archæological Institute will hold their annual gathering in the city on July 24.

An Innovation has been introduced in the Théâtre des Arts, Paris, which used to be known as the Théâtre des Batignolles. Instead of numbering the boxes they each bear the name of an ancient or modern author, such as Æschylus, Emile Zola, Tolstoi, Marivaux, Goethe, Musset, Shakespeare, Corneille, Molière, Racine, Schiller, Beaumarchais, Calderon, Dumas, Ibsen, Henri Becque and Sophocles.

Messrs. Marshall & Bradley, architects, of 31 Old Queen Street, Westminster, S.W., have removed their offices to Parliament Mansions, Victoria Street, Westminster, S.W., where all communications should in future be addressed.

An Inventors' Mutual Association has been formed in Birmingham. The objects of the Association are to bring together the inventors connected with the various crafts and industries by means of lectures, discussions, &c.; to assist and encourage each other mutually in respect of their ideas, inventions, improvements, and the like; to examine, demonstrate, or develop such as may be possible, desirable, or convenient; to protect the same by registration, letters patent, or by any other legal means secure to the author the rightful use and benefit thereof; and to agitate for the alteration of the present patent laws so that they may protect an inventor and his invention as is at present the case in other countries.

The Incorporated Association for the Protection of Property Owners at their last meeting included among their recommendations one to the effect: "That every municipal undertaking, including houses for the working classes (except in positions where the site is of great value), which does not show legitimate profit, be forthwith placed under the closest observation by the auditor, and if such undertaking cannot be made self-supporting within two years it ought to be sold or discontinued."

The Worshipful Company of Plumbers arranged a conference of representatives of municipal, educational and labour interests at the Guildhall on Thursday for the purpose of discussing the better protection of the public health by elevating the status and education of the workman. In a circular convening the conference the clerk to the Plumbers' Company stated that during the progress of the recent parliamentary elections district councils took steps to ascertain the views of the candidates on the measures considered necessary for securing the greater efficiency of health and water administration relative to these objects, and "this has resulted in very general expression of opinion as to further legislation being necessary. As the basis of British industry and prosperity is manifestly bound up in the systematic development of craftsmanship among industrial workers, and this in its turn associates the interests of citizenship in many of its widest and most important aspects, the discussions of the conference are looked forward to with much interest."

The Council of the Geologists' Association in their annual report have proposed that, in consequence of the cost of maintaining the library, and having regard to the small number of members using it, it should be handed over to University College. In return the college would keep the books in repair, and the members of the Association would have the use of the whole science library of the college. After discussion it was decided to postpone further action until the opinion of all the members has been obtained.

The Architect.

THE WEEK.

ACCORDING to CARLYLE, CROMWELL utilised some of the castles in the Highlands as garrisons, and the soldiers were so careful of their discipline and so exact to their rules they had a taming effect upon the Highlanders. He also built three citadels in Leith, Ayr and Inverness, besides many small forts through Scotland. The Rev. Dr. DYKES, of Ayr, has presented to the Kirk Session a document which throws a remarkable light on CROMWELL'S action. For a time St. John's Church had to be used as the armoury for the fort. As compensation it was arranged that money should be given to erect another church. The document is a certificate to the following effect:—"I doe hereby testify that Major-Generale DEANE did promise unto ye Burrough of Ayre the sume of one thousand markes sterling money towards ye building of a church in that towne, by reason that theire former church was employed for ye publique, and did give me order to pay 200*l.* upon layeing the foundacion one foote above ground, and 200*l.* when it was halfe built, and the remaynder when it was finished. In testimony whereof I have hereunto sett my hand this first day of August 1654.—MATH. ALURED." Underneath the above is the following:—"I have perused the promise, and doe know and agree to accepte ye same to be true.—RT. OVERTON." The financial arrangements confirm what CARLYLE says, that "seven or eight thousand men, well paid and paying well; of the strictest habits, military, spiritual and moral; these it was everywhere a kind of practical sermon to take note of."

THE demand at the present time appears to be for cottages not only for labourers, but for people who, though able to pay a higher rent, prefer occasionally at least to live in small dwellings. The principal cause of the demand arises from the desire of manufacturers and others to have a hold on workmen and labourers. The American Consul who lately visited Europe in order to study the subject, in his report says:—"The experience in Austria, where manufacturers generally furnish dwellings and fuel to their workmen free of charge, has been that it minimises the number of strikes. I am satisfied that this has also been the experience at Port Sunlight and Bournville Village, in England, where the rents are practically fixed at rates which pay only for maintenance, taxes and repairs, as well as at Essen, where the Krupp enterprises yield about 2 per cent. on the investment. Experience has shown in Germany, as elsewhere, that the more a manufacturer learns to differentiate between a man and a machine the more he is likely to reduce the danger of strikes." Bournville has been made the subject of a book by Mr. W. ALEXANDER HARVEY, who was the architect to the Village Trust from 1895 until 1904, and who is now the consulting architect, which is published by Mr. BATSFORD. Mr. HARVEY read a paper before the Architectural Association two years ago on "Cottage Homes," but within such limits he was unable to compress all the information relating to the subject. His book will be a manual to all contemplating cottage building. Bournville is not confined to Messrs. CADBURY'S workpeople. As the rents range from 4*s.* 6*d.* per week to 12*s.*, and the village is only four miles from Birmingham, mechanics, clerks and others in the Midland city are glad to live in a place where there is such unusual accommodation, for each cottage has an average open space of 600 square yards for growing flowers and vegetables. In 1904 the death rate in Bournville was only 6.9 while it was 19 in Birmingham, and the difference well suggests the salubrity of the village. The cost of the cottages is given, including an addition of 3¾ per cent., to represent profit. The lowest price cottage seems to be 135*l.*, but so low an amount would be impossible if the cottage were not one of a block of eight. Photographs, elevations and plans are given, and no effort is made to impart to the buildings an importance they do not possess. The book is a satisfactory description of a satisfactory experiment.

A FEW years since there was much litigation in the French courts relating to the Palais de Longchamps at Marseilles. M. BARTHOLDI, the sculptor of the colossal statue of *Liberty Enlightening the World*, claimed to have designed the group of structures and fountains. The process went through the various French courts, and eventually what could be considered as only a compromise was decided on. The Corporation of Marseilles were ordered to pay the sum of 13,770 francs. This money has been generously made over to the Society of French Artists. It is intended to apply it to the foundation of a prize of 400 francs which is to be awarded yearly for a work of art- painting, sculpture or architecture, in which there is evidence of invention or imagination. The sum is small, only 16*l.*, but the prize, we suppose, will be valued on account of the donor as well as the circumstance under which the funds were obtained. The most suitable way of using the money would have been to found a prize for a "ghost," for apparently that was the position which M. BARTHOLDI was supposed to hold.

THE generous spirit in which the JOHN RYLANDS library at Manchester is conducted is suggested by the resolve to bring out a series of facsimile reproductions of some of the most interesting of the unique and rarer works in the collection. The first group to be reproduced will consist of six volumes printed by WILLIAM CAXTON, NICOLE MARCANT, WILLIAM DE MACHLINIA, A. PFISTER and others, of which the only known copies are in the JOHN RYLANDS collection. Two hundred and fifty copies of each volume will be printed. After reserving 100 copies for distribution to the principal libraries of the world, the remainder will be sold at a price calculated to cover the cost of reproduction. By making the unique and rarer works of the library accessible in this way to students in all parts of the world, the Governors feel that they are making a valuable contribution to scholarship. The volumes will be issued with as little delay as possible. Among the recent additions to the library is a collection of the early editions of DANTE as well as other works relating to the poet, numbering about 5,000 volumes. It is another of Mrs. RYLANDS'S gifts. The library now contains over 100,000 volumes.

"ONCE a draughtsman always a draughtsman" expresses the condition of a class of assistants who suffer from the absence of an organisation resembling trade unions. There are cases where "clerks" have more claim to be considered as artists and architects than employers. In the United States the American Institute of Architects have wisely made arrangements to facilitate the entrance of draughtsmen among the members. One of the by-laws was as follows:—"An architectural draughtsman, who is over thirty years of age and who has been in the employ of a Fellow of this Institute for five years or more, and shall be recommended by such a Fellow or two other Fellows, and who shall have fulfilled all the other requirements of associate membership, may, in the discretion of the Board of Directors, be recommended for associate membership, and may be elected as provided in the case of candidates for associate membership." We suppose it has been found by experience that some Fellows were not disposed to aid in the conversion of an assistant into a rival. At the convention which was held in January the by-law was altered, and now runs:—"An architectural draughtsman who is over thirty years of age, who shall have fulfilled all the other requirements of associate membership, may, in the discretion of the Board of Directors, be recommended for associate membership, and may be elected as provided in the case of candidates for associate membership." The age limit is still too high.

BASALT.

BASALT is the hardest and heaviest of all stones, and yet it is in modern times the least used in building or in the arts. With the ancients it was prized. According to PAUSANIAS statues representative of the Nile were made of basalt because it was believed the source of the river was to be found in Ethiopia, where the material was said to abound. That view is confirmed by the statement of PLINY, for he refers to the statue of the Nile which was consecrated by VESPASIAN in the Temple of Peace as having been formed out of the greatest block of basalt which was seen in Rome. He also describes the statue of MEMNON which was in the Temple of Serapis, in Thebes, as an example of sculpture in basalt. PLINY says the stone was derived from Arabia as well as Ethiopia. The supply is not exhausted. Sir T. H. HOLDITCH, president of the Royal Geographical Society, in describing Southern Arabia, says:—"A curious geological feature of the coast are the basalt fields near Kosair, which spread across the flat country in a stratum of black, rock-like lava. The Arabs attribute this basaltic effusion to the destruction of pagan cities. Probably it is the source from whence Egypt and Assyria derived material for statuary art."

In this country the basalt is generally black in colour, but the foreign basalts are sometimes partially red or grey or green. There is a figure of a lion in the Louvre which often appears to resemble fine bronze on which time has conferred a greenish patina. There are still lions and sphinxes in Rome of black basalt. There are also Egyptian figures of greenish basalt in the Capitoline and other museums. The material was always hard to work, and therefore was more likely to be used in a country like Egypt, where sculptors were regarded as artisans whose labours were cheaply obtained. The question of cost is, no doubt, the main reason why in modern times basalt is only used in France for the making of bottles, and in England for mending roads. Yet the basalt of Shropshire and South Staffordshire has a good deal of green in its composition, and may be considered as a handsome stone. Basalt is found in the form of dykes, which evidently forced their way through the strata of sedimentary rocks. In Fingall's Cave and in the Giant's Causeway the basalt assumes a columnar form which rivals the productions of art. In Arthur's Seat, near Edinburgh, the stone is in an immense mass that forms a contrast with the rather delicate dykes which are found in other parts of the country. Why the stones should assume regular forms was at one time a puzzle. But the experiments of Sir JAMES HALL, the philosopher, who suggested that Gothic tracery was an imitation of wickerwork, have been accepted by some as explanatory of the columnar arrangement.

We have stated above that Frenchmen used basalt in their glassworks. Although it is so remarkably close in grain, basalt is converted into glass by the exercise of a lower degree of heat than is required for other materials. What is also extraordinary is that, when placed under conditions favourable to crystallisation, it afterwards assumes a regular form. HALL believed that basalt was at one time subjected to heat like other volcanic rocks, and was afterwards changed by some peculiar agency into the forms which often belong to it. HALL'S experiments were not conducted with the precision that was desirable, and at the beginning of the last century GREGORY WATT undertook a series of experiments which would leave no doubt about the results.

He obtained 7 cwt. of basalt and he had it thrown into a furnace in an iron foundry. He found that the quantity of fuel required to fuse it was only about one-half of what would be required for an equal amount of pig-iron. The explanation of the difference is only conjectural. The basalt, after being fused, was allowed eight days to cool. It formed an irregular mass measuring 3 feet 6 inches by 2 feet 6 inches, the thickness varying from 4 inches to 8 inches. In the vitrified basalt a large number of nearly spherical globules appeared, and WATT ascertained that if the union of the globules was imperfect the fracture of the mass was rhomboidal. If the cooling was gradual secondary spheroids were found. After considerable study he came to the conclusion that if a valley were filled with a mass of fluid basalt, the earth will slowly receive its heat and moisture, and dispose it to the formation of a layer of immense spheroids in contact with the ground. But since no penetration can ensue between these spheres, they will become mutually compressed into the hexagonal form, and the resistance of the earth prohibiting their advance downwards, they must extend their dimensions upwards, and thus form prisms whose length may be indefinitely greater than their diameters. WATT'S theory is not universally accepted by geologists, and it is said that phenomena on a small scale, which resemble the basalt prisms, are sometimes observable with bricks which are subject to continuous and extreme heat. It would be strange if no other material could display columnar forms.

We can imagine the basalt not as small spheroids, but as large balls. There is a tendency in nature for bodies which are heated until they become almost fluid to assume spherical forms. Now, if we suppose the balls lying together in a heap and pressing equally against each other they would become hexagonal. We then have such a collection as can be seen in the Giant's Causeway, which THACKERAY ridiculed and yet correctly described when he said:—"The number of basaltic pillars composing the Causeway has been computed at about 40,000, which vary in diameter, their surface presenting the appearance of a tesselated pavement of polygonal stones—each pillar is formed of several distinct joints, the convex end of the one being accurately fitted in the concave of the next, and the lengths of the joints varying from 5 feet to 4 inches. Although the pillars are polygonal, there is but one of three sides in the whole 40,000 (think of that!), but three of nine sides, and it may be safely computed that ninety-nine out of 100 pillars have either five, six or seven sides." THACKERAY, however, did not consider the Giant's Causeway was a more majestic object and did not occupy more space than the barge which in his time was moored at Hungerford Market.

Although the basaltic columns, which appear made up of separate stones and rise to a height of over 300 feet, are accepted as the most wonderful examples of volcanic products, the dykes generally consist of columns which are of one piece and are arranged vertically or horizontally. It also occurs in masses which are not columnar, and, as in the Deccan in India, may have an area of several thousand square miles. Sometimes the rock passes into granite, but as it is generally found disturbing later rocks, it is supposed that they represent forces which were in operation at a period which must be considered as almost modern if compared with the time when the primitive granites were produced.

Geology is now supposed to have industrial aspects, and it is strange that a rock which exists in various parts of the world is of comparatively small use. It is believed to have withstood a crushing force of 17,000 lbs. per square inch. Its strength may have been greater, for it is a refractory material difficult to test. The examples of sculpture which survive prove its endurance. But it has the defects of its qualities, and on account of its strength it cannot be operated on without an expenditure of labour which in modern times could not be afforded, even for monuments that are intended to be national. FLAXMAN considers that the intagliated character of Egyptian sculpture was dictated by the use of basalt.

JAPANESE ARCHITECTURE.*

WHAT is known as the association theory of beauty or of art, which is an embodiment of beauty, has not been universally accepted. Those who claim to have advanced ideas refuse to believe that such a building as a Greek temple does not attract attention on account of the intrinsic beauty of the different parts, and they deny that it is necessary to think of the heroic people who erected and who employed one in their religious services. Are not the ruins of the Coliseum sufficiently impressive to the humblest classes of tourists, although unable to recall the great events of Roman history? While it may be admitted that a beautiful object has an attraction which is independent of association, we must allow that in the modern acceptance of art association counts for much. It has been agreed during so many generations that Greek and Roman architecture (and some will add Gothic also) are the most perfect varieties which have been produced, it is very difficult for a modern European to think otherwise on the subject. That opinion has become almost an instinct. If doubts should arise there are innumerable treatises on æsthetics to dispel them.

It must now seem strange to anyone who considers the matter that during thirteen centuries another style of architecture was being practised in the world without any knowledge on the part of Europeans. In these days, when voyages round the world are a not uncommon pastime, the mystery which surrounded Japan must seem to be incredible. It was a country where art flourished, and more especially industrial art. Yet when our Hyde Park Exhibition was held in 1851 to display the industries of all nations, Japan was as completely ignored as any of the regions of the moon. We have a record of the neglect which forms part of the Albert Memorial. One of the great groups, and the most successful among them, is *Asia*, by JOHN HENRY FOLEY. We see a kneeling elephant with a woman seated on the animal drawing back her veil, suggesting the revelation of the Asiatic peoples. There are figures of a Chinese, a Persian, an Indian and a Turk or Arab. Nothing is introduced which would suggest that in Japan there were more varieties of artists or craftsmen than in any of the other divisions of Asia. In the Exhibition of 1862 the omission was repaired; and, indeed, it may be said that it was in South Kensington Japan was first revealed to Western Europe, for the objects to be seen at The Hague were only partial representatives of the art of the Eastern islands. Since 1862 many exhibitions and illustrated books have enabled people in this country to realise the characteristics of all varieties of Japanese art, with one important exception, that of architecture. There have been reproductions of Japanese houses in exhibitions, but they were inadequate to enable spectators to form accurate ideas of the builder's craft.

In the new book by Mr. R. A. CRAM, an American architect, we have recorded the impressions not only of an expert, but of an enthusiast. We do not know how long he has lived in Japan, but he has endeavoured to understand the character of the people as well as of their works. That is the proper method to follow, for it is more likely to lead to accuracy of view than the superciliousness of those who judge everything by the standard of Western Europe, as if it alone were perfect. Indeed, many critics who profess to scorn the association theory show their subservience to it whenever they come in contact with work of any kind which is novel. But the readers of Mr. CRAM'S book must endeavour to think with him. If we adopt Vitruvian or Palladian rules he is sure to be condemned as well as the buildings and other works he eulogises. His countrymen have done much both as missionaries and as traders to convert Japan to modern notions. But he is not proud of the results. Indeed, he cherishes the belief that sooner or later Japan will absolutely slough off what he calls the absurd habiliments of Western and Westernised art, and then there will be a rebirth of the art of Japan in all its original splendour. Mr. CRAM believes that the change or decadence of Japanese architecture is not entirely due to moderns. It began, he considers, with the attack on Buddhism, the latter being the religion to which the great monastery of Horiuji, erected in A.D. 607, was dedicated, and part of which still remains. In style it is Chino-Korean, which the author describes as one of the most extraordinary architectural styles in the world :—

> It is the counterpart of the Romanesque of the south of France, and the two styles bear exactly the same relation to the root style of Greece, with the single exception that in the West there was no change in materials, while in the East there was a reversion to the original and primitive wood. From Athens to Asia Minor, thence to Persia and so to India, architecture, painting and sculpture worked their way back against the sun and over provinces where still remained traces of enormously ancient civilisation. Bit by bit the original impulse was modified and took on new forms: the mysterious and mystical East entered in, dominated and revolutionised the Hellenic impulse, and at last, when the great progression reached China, the genius of old Cathay brought the final change. Mysticism and meditation, the soul of the infinite East, had wrought out of alien shards its own intimate and exquisite habiliments. In the West action and conduct and the spirit of innovation, driven by dominant Christianity, had transmuted the original Greek through the decadent Roman into the vigorous, aggressive, practical Romanesque; in the East mysticism and tradition, guided by the subtleties of Buddhism, had wrought their own intimate change. When at last the limit of land was reached, and the advanced guard of the new life of the East stood on the shores of the confining sea, almost the last vestige of Hellenic forms was gone, and only in the entasis of the columns of the great gate and in the thin folds and studied calmness of the sculptured drapery of the statues are to be seen the lurking traces of Greek art, and within a few years these also were to disappear, giving free field for the full exercise of the indigenous Japanese spirit.

The influence of Greece upon Eastern art is a subject which has given rise to controversy. Some scholars have maintained, on the contrary, that Indian influence is to be found in Ionian dialects, and it is not impossible the Indian spirit could be traced in other fields. FERGUSSON supposes that in a period when Hindu sculpture had declined, its downward progress was arrested by a school which evidently respected some traditions of Classic art. But there is no such influence observable in the buildings of India. It is also reasonable to suppose that the improvements which are to be traced in the temples of Korea and Japan were not beyond the capabilities of a clever people who for a long period had been workers in wood and were fond of ornamental forms. Mr. CRAM considers that the pagoda of Yakushi-ji marks the birth of national Japanese architecture, which dates from A.D. 680, or a century after the introduction of the Korean type. In the ninth century was erected the sanctuary of Ho-o-do. The three temples are far superior to the later examples which are to be seen throughout Japan. For we are told that "in every detail the early work has been coarsened and vulgarised; the low roofs with their wonderful curves have risen to gigantic sweeps of blue tile, steep, coarsely curved and loaded with huge ridges; the bracketing has become a wilderness of tortured carving and joinery, tedious and overloaded; ornament is no longer constructional; it is arbitrary, and by its very prodigality it becomes cheap and tawdry." Japan, consisting of a warrior race, suffered from civil wars, and the disturbances were not without their effect on temples and palaces. Not until the end of the sixteenth century did the barons succeed in a triumph of which the result might be compared with the

* *Impressions of Japanese Architecture and the Allied Arts.* By Ralph Adams Cram, Fellow of the American Institute of Architects, Member of the Society of Arts. (London: John Lane.)

Digitized by Google

proposal of Bishop Berkeley when he suggested that Ireland for its own advantage should be surrounded by a brazen wall. For over two centuries Japan was practically isolated from the rest of the world, and with the greatest advantage to herself, for it made the people self-reliant and self-sufficing. The arts of decoration flourished, and, as happened sometimes in Europe, they were accepted in buildings as if they were of more importance than construction. Some examples which are given of the excess of ornamentation are very curious. When once a decline sets in it cannot easily be resisted, and if good architecture is now rarely seen in modern buildings, we suppose the blame must be borne by the ornamentists. According to Mr. Cram, "domestic work is still almost wholly on the old lines so far as the middle classes are concerned; the nobles are building palaces from European designs that would dishonour a trans-Mississippi city or a German suburb. The public buildings designed by local 'foreign' architects are even worse, and the least offensive examples of Western styles are the work of natives."

Mr. Cram, as an American, is necessarily a utilitarian, and he could not be satisfied with investigations of the early history of Japanese architecture or lamentations over its decline. He has drawn lessons from what he has seen. One is the adaptation of the buildings to their surroundings. They seem "almost to be a concentration and perfection of the hills and trees," and the contrast in that respect with buildings on Western lines is marked. Then there is the unity of the composition, "the refinements of line and proportion having their equals only in the architecture of Greece and Mediæval Europe." The interiors of the temples are as awe-inspiring as the Gothic churches of Europe. Concerning their woodwork, Mr. Cram remarks:—

Perhaps the greatest lesson one learns in Japan is that of the beauty of natural wood, and the right method of treating it. The universal custom of the West has been to look on wood as a convenient medium for the obtaining of ornamental forms through carving and joinery, the quality of the material itself being seldom considered. In Japan the reverse is the case. In domestic work a Japanese builder shrinks from anything that would draw attention from the beauty of his varied woods. He treats them as we do precious marbles, and one is forced to confess that under his hand wood is found to be quite as wonderful a material as our expensive and hardly worked marble. In Japan one comes to the final conclusion that stains, paint and varnish, so far as interior work is concerned, are nothing short of artistic crimes. In another respect Japanese builders are right and we are wrong. They do not destroy that sense of protection every room should possess by filling whole sides thereof with plate glass. Instead, their windows are of delicate latticework covered with translucent paper, and the result is a light that is soft and pleasant. Nothing can be more absurd than our modern fashion of filling an entire window opening with one or two sheets of glass, particularly when, as happens in cities, there is no possible reason for looking out of doors. There are many minor lessons of similar nature which we would do well to learn from the East, and these lessons it is perfectly possible to take to heart and adapt, without copying the qualities which are expressive of a civilisation radically different to ours. Such copying would be affectation, but the profiting by the lessons set before us would be simple common sense.

Interesting descriptions are given of Buddhist temples and Shinto shrines. Mr. Cram compares them with some renowned Gothic buildings, including "St. Albans Cathedral, desecrated by the Brumagem 'Gothic' of the modern vandal, the late Lord Grimthorpe," and points out the freedom of the Japanese buildings from any semblance of makebelieve. Yet the missionaries with the best intentions, he says, try to win converts with corrugated iron chapels and trade altar ornaments. The temple gardens are almost as interesting as the buildings. Nowhere is the picturesque value of rocks more evident.

One of the most important chapters relates to figure sculpture—a class of work which is not appreciated by foreign critics. Mr. Cram believes that the figures in the temples are unknown to all except the Japanese. He has been able to obtain some photographs which suggest that those seated and blessing figures of Buddha have many of the qualities which should be found in architectural sculpture. There is symmetry in the arrangement of the drapery, and the modelling of the figure shows a regard for truth which has not been credited to the Japanese artists. One which stood formerly in the Horiuji, and which is supposed to date from the sixth century, is described as "a priceless example of that amazing Asiatic modification of an Hellenic norm, which proves a ramification of Classic influence, a persistent survival of the Greek idea, in lands and among people severed from the primal source by almost the whole diameter of being." But would not a living being in Korea serve for a model as well as any Greek statue of which the sculptor was likely to have only a tradition derived from recollections of some remote artist? As Mr. Dick always found the head of Charles I. coming to him as an inspiration or an obstacle to his composition, Mr. Cram sees Greek in the bronzework as well as in the wooden temples. But the people who would be swayed by the Buddhistic idea would be capable to express an embodiment of the great teacher. In the eighth century the sculptors came nearer to everyday life, and the "God of War" and "Incarnation of Power," of which photographs are given, are as truculent swashbucklers as any seen on the Japanese stage. The former certainly appears to be a portrait of a man who, like an actor, could distort his features. But Mr. Cram sees in it a conventionalised face like a Greek mask.

Throughout his book Mr. Cram writes as an artist. He does not believe that Japanese art has been adequately appreciated by Americans or Europeans. With remarkable earnestness he sets himself to demonstrate that the works can be tested by rigorous laws. And after reading the pages Japanese art will appear to have a closer relation to the art of other countries. This does not necessarily mean that the Japanese even indirectly imitated the works of European artists. Of late years they have been employed to produce imitations, and it cannot be said that the results are satisfactory. In faithful copying they are not equal to the Chinese. The Japanese prefer to follow out their own principles, which sometimes correspond with those accepted elsewhere. Even when we differ from Mr. Cram we must admire his enthusiasm, and he has been successful in producing a book which will give genuine pleasure to a reader.

ARCHITECTURE OF THE COTSWOLDS IN THE SIXTEENTH AND SEVENTEENTH CENTURIES.*

THE domestic architecture of the Cotswolds has an interest all its own, and although I have from time to time made in the pages of our Journal many of my audience familiar with its features, this is the first time I have had an opportunity of explaining its merits and beauties to the members of this Society. I may, therefore, be pardoned if I reiterate some things which I have written and refer to remarks of others who have gone over the same ground as myself. The keynote of the architecture is its simplicity, and this simplicity arose to a large extent by reason of the isolation from the world that the district enjoyed, an isolation which exists in some parts even to this day, railways and other means of locomotion notwithstanding. This simplicity was to some extent a necessity of the case, as only local materials were available, and these, although abundant, were few in variety. The staple was stone, good, plentiful and quarried on the spot. The oolite formation stretching right across the district provided for all necessities. Everything that could be improvised from this material was so done. Stone was used for walls, floors, roof coverings,

* A paper read before the Society of Architects by Mr. Ellis Marsland, hon. sec., on Thursday, February 15.

Digitized by Google

chimney-stacks and chimney openings. The only other material was wood, also plentiful but of the hard variety, and consisted mostly of oak, chestnut and beech. Of soft wood there was little, consequently we find that the joiners' work was confined to doors and panelling, the window openings having the glass glazed directly into the stone mullions. Iron was scarce and confined to hinges and casements. Lead had to be procured from a distance, and therefore was not available for roofs or flashings, but confined to the setting of the window glass. This dearth of lead was obviated by the omission of all hips, and the roofs were carried through to gable ends, and thereby produced the leading feature of the style and gave it its character. It is this grouping of gables that gives it charm, and is a result of the limit of the variety of the materials available, but we shall see that in spite of the absence of lead the roofs were made sound and watertight, and the water was conveyed away from the roof in a more or less satisfactory manner. It is to the mason, therefore, we must give the first place, and right well he deserves it. The skill and cunning of his craft will be abundantly evident in the views I shall place before you.

It has been urged by some writers that these stone walls, although of ample thickness, were imperfectly bonded and the interior was not solid, but contained a good deal of loose material. So far as the latter assertion goes, it is undoubtedly true, but it must be remembered that lime was difficult to obtain and had to be sparingly used and confined to bedding and pointing the stones; a prodigal use of mortar was prohibitive by reason of its scarcity; lime had to be burned, the only fuel available was wood and the process was long and tedious; but it must be admitted that, although the walls were not altogether solid, yet the masons abundantly made up for this deficiency by reason of the excellent jointing of the stonework, which required little help from the cementing material, as many drystone walls can testify.

The keynote of the style, as before remarked, was simplicity, and if you will notice the diagram on the screen you have in that one drawing all the elements of the Cotswold style, which you will find exemplified in infinite variety in the subsequent views. It will be observed that it is a transition from the Tudor style of the previous century adapted to the material and the needs of the inhabitants. The landowner's occupation was the rearing of sheep, the wool from which was his means of living, and although he prospered considerably, yet a certain economy was desirable in his building operations, and there was little circular work or superfluous ornament; plain solid lintel and mullion was all he could afford. You will, however, notice the exquisite proportion and the relative area of voids to solids, the diminishing number of openings on each successive floor terminating in the eyelet in the apex of the gable. The string-courses and labels were identical, always about 6 inches deep, splayed and hollow moulded. The mullions were varied in section as time proceeded, originally hollow, then chamfered, and finally ovolo moulded, but always the same proportion. The openings were from 15 inches to 16 inches wide, and the height varied from 3 feet 6 inches on the ground floor to 3 feet in the gable, and sometimes 3 inches less.

The gables, so marked a feature in the style, were set at about an angle of fifty-two degrees. In the minor buildings the roofs were carried over the walls, and we shall see examples of these, but the more important buildings had copings, the section of which was varied, sometimes flat, as in the example before us, but more often in the earlier examples moulded. These projected over the walls just above the slates, and the space so formed was pointed up, and so obviated the necessity for lead or other flashings. A gablet or finial of stone made an appropriate termination. The chimney-stacks were also a prominent and ornamental feature, rising squarely and solidly through the roof; they were terminated by a hollow string-course, and the flues were in most cases carried up separately and diagonally, forming in the process a pyramidal stopping to the base of the shaft and terminated by a moulded cap, the detail of which became more elaborate as the Renaissance influence became stronger. The stone weathering worked on the base of the shaft should be noted, coinciding with the pitch of the roof, under which the stone slates were tucked and pointed, and again the necessity of lead flashing was obviated. The roofs had to be strongly framed and pinned to support the heavy covering of stone and slates; these slates were obtained from certain beds of the oolite, by exposing the blocks of stone to the action of frost, causing them to split up into laminations of the required thickness. These were shaped and sorted into a variety of sizes, the larger ones being used at the eaves and diminishing in size to the ridge; one or more holes were drilled in each slate into which an oak or deal peg was driven; it was then hung over the tile batten, the under side between the rafters was plastered with coarse plaster, and made a sound, warm, lasting and watertight covering. The valleys were formed by rounding the bed and cutting and shaping the tiles to fit the hollow in a very ingenious manner, so that no leadwork was required. The covering to the ridge was made from the ubiquitous stone, so that the whole externals of the building were indebted to the quarry for their being. But the charm of these old stone roofs, which in a few years became covered with lichens, must be seen to be appreciated, and one regrets that times have so changed that this style of roof is going into desuetude owing to cheaper and baser methods being adopted.

A word, perhaps, might be said as to the entrance doorways; these had as a rule a deep stone lintel, over which the label or string was carried, and the sides and head were either chamfered or moulded according to the relative importance of the doorway or the character of the building.

Porches were not as a rule a feature, but at a later period these were added to the main building, and very charming and appropriate some of them are. Wooden pents of a Renaissance character have at times been added, indeed, to several of the examples which will be seen. The simple doorway appears to have been removed by a subsequent owner, who was, perhaps, a well-to-do clothier, who, not content with the modest doorway provided, had introduced one of Classic proportions. These alterations were sometimes not confined to the doorways, but when an addition was required to the building one was made not in the old simple style, but in the prevailing taste of the time. This, of course, makes the building more interesting historically, but detracts from its harmony. If the prevailing note of the exterior of these old buildings was simplicity, the interiors also showed the simple life lived by their inmates.

The prevailing plan is a parallelogram, surrounded by stone walls, divided up by wooden partitions into more or less square rooms, and one marvels in these days, even in the largest of the houses, at the absence of minor offices. Other buildings were L shape in plan, others H, but all are wanting in the modern ideas of comfort and privacy, one room opening out into another, and doors opening straight into rooms; but when we read from the pages of the immortal Pepys that it was quite usual to pass from one room to another, and even to interview a lady or gentleman while he or she was in bed, and when also it was customary for the respective guests at a wedding ceremony to see the bride and bridegroom safely to bed, one ceases to wonder at the limited attempts at convenient planning, and which, to modern ideas, leaves much to be desired. I am afraid I cannot hold up the plans of these Cotswold residences as examples to be followed by our students. Yet they were comfortable enough so far as the individual rooms were concerned. The thick walls provided convenient window seats, and the wide and deep chimney opening suggests warmth and comfort. Here, again, the local stone is in evidence, and provides the material for the principal decorative feature of the interior. Wood was the only fuel, and the openings were wide and high. The limit of the length of stone obtainable made a compromise necessary between the lintel and the arch; therefore we find a flat four-centred arch spanning the opening, yet not an arch, but formed of two pieces of stone acting as cantilevers with a vertical joint in the centre, and a wood beam above tying the whole together. The jambs and head were simply or fully moulded according to the position or the importance of the building, and some examples will be seen in the views presented. These old openings in later times were filled up and modern stoves and chimneypieces inserted, attended subsequently by disastrous results. When coal became the prevailing fuel soot accumulated, and the beams being dry brought about a catastrophe, and deprived the present generation of many an interesting specimen of this old-time architecture.

The floors of the interiors were carried by stout oak or chestnut beams appearing below the ceiling, and with splayed or moulded edges appropriately stopped. Heavy wood lintels were placed over the window openings into which the floor beams were framed, thus binding the whole house together.

The walls were either plastered or panelled in oak according to their relative importance, and the floors were

Digitized by Google

laid with oak or chestnut planking, or being on the ground level were paved with stone.

The use of ironwork was limited, yet one comes across some charming remains of casement stays and fastenings; iron strap hinges and door knockers which are simple and effective and redound to the credit of the old craftsmen, whose delight and interest in their work was unbounded, and in later times was developed and encouraged by Italian influence and forms.

The old window glass and lead glazing added a charm to the openings in such parts as it has been permitted to remain, but, as will be seen, the modern sash and frame or casement has usurped the space occupied by the mullion and glass in the craze for change.

This old Cotswold style lasted for about 100 years, and gave place to the Renaissance which eventually penetrated this remote district. Its coming was heralded by certain alterations being made in the old work, and subsequently when new buildings were erected the old style was given up and new forms took its place. This was inevitable. The old had its limitations in the height of its rooms, which rarely exceeded from 7 feet to 8 feet. The craze for lofty rooms, to meet the prevailing fashion, could not be met except by altering the whole proportion of the architecture, so it went. From that time to this fashion in architecture has ruled, no settled style has developed, but revivals are the order of these later days.

The study of this Cotswold work, which was honest and true, may lead to its revival, as it has in it all that is necessary for those who are content with simple forms, and in the hands of a sympathetic architect may yet renew its youth.

THE RUINS OF RHODESIA.

ON Friday last a meeting of the Research Department of the Royal Geographical Society was held to discuss the subject of the ruins in Rhodesia, which by some were supposed to date from the time of Solomon. At the request of the British Association, Mr. MacIver preceded that body to South Africa by some months, in order to explore and to prepare a special report on the subject of the ruins. That report, as first presented in a lecture at Bulawayo, says a correspondent of the *Glasgow Herald*, roughly disturbed the equanimity of those who traced the oldest of the ruins back to times long before the commencement of the Christian era. Mr. MacIver has not abated the vigour of his attack on this school of opinion by one jot or tittle since he addressed the members of the British Association at Bulawayo. His paper, though advisedly brief, was both compact and comprehensive. The propositions which he set out to show had been proved by his excavations were (1) that the Rhodesian ruins belong to one period only, (2) that the period in question is Mediæval and post-Mediæval, and (3) that the buildings were constructed by the people whose implements, weapons and ornaments are found there—that is to say, by a negro or negroid race, closely akin to the present dwellers in the country. The sites examined by Mr. MacIver were seven in number. Three were near the Portuguese frontier—Umtali, the Rhodes estates at Inyanga and a remote place sixteen miles still further north—and contained rude buildings of stone, which Mr. MacIver pronounces to be more primitive in character and actually a little more ancient in date than the better-known constructions of Matabeleland and the Victoria district. It was in this better-known part of the country that the four other sites visited were situated. These were Dhlo Dhlo, Nanatali, Khami and the great Zimbabwe. Mr. MacIver's paper dealt mainly with this second group, because it was among the sites just enumerated that he obtained the most decisive evidence of date and origin. After describing the characteristics of the Dhlo Dhlo, Nanatali and Khami ruins, and adducing evidence in support of his contention that they are of Mediæval origin, Mr. MacIver came to the question of the Great Zimbabwe, most famous of all the ruins. It is on this group that attention has mainly been centred. Mr. MacIver confessed that the "Elliptical Temple" is a most interesting building, the finest example of its kind; but he added that that kind is only the same as can be found on other sites in Rhodesia. The temple, he declared, has in fact scarcely a feature which cannot be explained on the supposition that it is a royal kraal. It is more massive but has no other point of superiority over several of the ruins. Further, without wishing to disparage the temple, he thought it necessary to protest against the highly exaggerated idea of its perfection which is prevalent, declaring that it evinces no knowledge of architecture, only a certain skill in piling up stones. The assertion that certain walls have been rebuilt Mr. MacIver also pronounced to be erroneous, ascribing it to imperfect knowledge of the characteristics of the Rhodesian ruins in general and of "the shoddy methods of their builders." Nor would he admit that the ruins showed evidences of a superposition of periods, holding that what had been regarded as a succession of foundations were nothing but the layers of a single platform. In short, Mr. MacIver came to the conclusion that, like the other ruins, the "Elliptical Temple" was built by Kaffirs, and its date was decided by fragments of stoneware, Nankin china and Mediæval Arabic glass. The Great Zimbabwe, therefore, would be contemporary to within a century or so with Dhlo Dhlo, Nanatali and Khami, not earlier than 1400 or 1500 A.D., and possibly even later. Though somewhat older, the ruins along the Portuguese frontier could not be considerably older than the Great Zimbabwe, because they formed a series of which Umtali was the southern link, and at Umtali had been discovered a building which possessed the characteristics of the developed Zimbabwe style, as well as a fragment of Mediæval ware. As to the question of the intercourse which non-African peoples had had with the East Coast of Africa in the past, Mr. MacIver professed no special knowledge. But there was no archæological evidence extant to prove that the civilised world had any considerable knowledge of or intercourse with East Africa prior to the time of Mohammed. And, if he would suspend judgment with regard to so late a time as that of the Roman Empire, *a fortiori* he would refuse to discuss anything so shadowy as the possibility of a yet earlier trade with any country further south than Somaliland. The president, Sir T. Holditch, read letters from Dr. Arthur Evans and from Professor Gregory, of Glasgow, the former stating that Mr. MacIver had made out a satisfactory case for the late Mediæval origin of the buildings, while the latter referred to the shape of the gold ingot as suggesting Phœnician influence in the early mining industry of Rhodesia. Mr. R. N. Hall referred to Mr. MacIver's omission of reference to conical towers, carved birds and phalli, and to the mines and the native traditions. Dr. Keane supported Mr. Hall's view; Mr. F. C. Selous commented on the absence of inscriptions or other signs of a highly civilised race ever having inhabited Mashonaland. Sir Harry Johnston said he was impressed by the supposed evidences of phallic worship; Mr. H. Balfour suggested the clearing up of unexplained points by organised investigation like that carried on by means of the Egyptian Exploration Fund. Mr. MacIver, in his reply, disclaimed any intention to deal with the mines, and declined to accept the rude carvings referred to in the discussion as indications of high civilisation.

THE ROMAN FORUM.

A LECTURE was given by Mr. St. Clair Baddeley at the Birmingham and Midland Institute last Monday on "The Roman Forum." The lecturer said that (according to the *Daily Post*) perhaps to some of those present the ancient Forum at Rome still conveyed the idea of great remoteness, remoteness from Warwickshire in 1906. Certainly both sea and land must be traversed in order to reach it and to get actually into touch with it, and yet they had but to go a few miles outside this great industrial emporium on to the Icknield Way in order to find a neighbourhood abounding in evidences of the Roman occupation, the occupation that was decreed by the Emperor and Senate of Rome in the year 45 B.C. Fourteen centuries back the land here was ruled by the brain which ruled in Rome. There was then a complete unity between the two countries. The real propinquity was never brought home to him more forcibly than it was in England two summers ago at a little town in Monmouthshire, which occupied the site of a Roman camp. In the centre was a small triangular patch of turf called the village green, on which they were told the children were wont to dance around the Maypole. After some trouble permission was obtained to make excavations on the green, and 2 feet below the surface they found a Roman pedestal bearing the names of two consuls of the year 172 A.D. They also found the remains of an oak post surrounded by seventeen skeletons, which were presumably the remains of felons and suicides of the Middle Ages, who were buried around the gallows-post. The excavations were filled in and covered up, and the last time he saw that village green the children were

Digitized by Google

going back to have their dance around the Maypole. There were those, he said, who were wont to think the discoveries of the Roman Forum were not so important as those of, say, Egypt; but it was just where they made the mistake. Her antiquity was not the strongest point of Rome, and perhaps not her weakness. Her years must be counted not by mere numbers, but by her epoch-making men and the greatness of her actions. Our civilisation was the offspring not of Egypt but of Rome; our arts and literature and much of the nobility of our language were derived not from the Nile but from the far humbler agricultural communities who lived beside the Tiber. The site of the Forum was the heart of the mother of our civilisation. He went on to say that during the last six years a number of lost objects had been recovered for us, thanks to the splendid work of Commendatore Giacomo Boni, and detailed many interesting discoveries that had been made by the excavators. He made special reference to the excavations of the site of the Comitium and of the thick slabs of black marble beautifully veined with white that were unearthed, and were supposed to mark the place of burial of Romulus. Many statue bases were found, and on one of them, a view of which was thrown on the screen, was an inscription to the effect that it had been dedicated to Mars and to the founders of the Eternal City by Maxentius in 308 A.D. It had been surmised that the base may have been surmounted by a bronze wolf, symbolical of the she-wolf that, according to the legend, acted as foster-mother to Romulus and Remus. Many other interesting discoveries were described by the lecturer.

ROYAL HIBERNIAN ACADEMY.

ACCORDING to custom the Royal Hibernian Academy was one of the societies of Dublin that presented an address to the new Lord Lieutenant of Ireland, Lord Aberdeen. The president of the Academy, Sir Thomas Drew, was unable to be present through illness, but the following members attended:—Messrs. S. Catterson Smith (secretary), W. Nassau, B. Browne, James Brenan, Joseph M. Kavanagh, Oliver Sheppard, Henry Allen, B. Vincent Duffy, T. Manly Deane, Dermod O'Brien, W. M. Mitchell, Charles Russell, Alexander Williams, Robert Shore and Sir Charles Cameron.

The address was as follows:—May it please your Excellency,—We, the President and members of the Royal Hibernian Academy of Arts, beg to tender our most cordial and hearty welcome to your Excellency and the Countess of Aberdeen on this happy occasion of your coming amongst us for a second time as representative of our Gracious Sovereign. We may be permitted to recall to your Excellency that the Academy we represent was incorporated by Royal Charter in the year 1823, "for the better cultivation and advancement of the fine arts in Ireland," an object which we have sedulously pursued. In the year 1861 her late Majesty granted us a new Charter increasing the number of academicians and extending our privileges. We were endowed with our existing Academy house in 1823 by the munificence of Francis Johnston, president of the Academy, and are in receipt of a small annual grant from His Majesty's Government. We hold an exhibition of contemporary art each year and maintain a school where instruction is afforded gratuitously to students desirous of making art their serious study. Recently winter exhibitions have been held in our galleries, which, we are happy to record, have proved widely appreciated and instructive. We may particularly refer to the memorial exhibition of works by the late G. F. Watts, R.A., O.M., which is at present on view. Owing to somewhat obscure causes our Academy, now in its eighty-third year, has not proved so successful as our predecessors had hoped at its establishment. In consequence, and at our request, His Majesty's late advisers appointed a committee to inquire into the past history and future management of the Institution. This committee has not as yet had time to report, but when as we trust a report favourable to the claims of the Academy has been issued, we hope we may count upon your Excellency's interest with His Majesty's Government in furtherance of such of its recommendations as may favourably affect us. We take this opportunity of expressing our appreciation of the personal interest previously taken in our progress by your Excellency, and we trust we may again add your name to the distinguished list of our vice-patrons, and have your sympathy and interest in the welfare of our Academy.

In reply his Excellency said:—Mr. Catterson Smith, the welcome and the greeting which in this gratefully expressed and kindly address you have accorded to me as the representative of His Majesty King Edward, cannot fail to be heartily appreciated. I have also listened with much interest to your narrative of the chief features of the origin and history of the Academy and its operations. Such an institution has undoubtedly an important mission to fulfil, and it is, of course, most desirable that every opportunity and encouragement should be afforded for the fullest possible attainment of the object aimed at. It is much to be hoped, therefore, that the official inquiry to which you refer will result in recommendations which it may be possible to adopt for the benefit of your Academy and the interests of art generally. With regard to the more recent example of your proceedings for the promotion of education and culture of art and its influence, I may be permitted to congratulate you on the success of the Watts memorial exhibition of pictures. It is indeed a very striking collection, and for my part I cannot but feel that it would be worth while to travel a long distance to have an opportunity of studying even one or two of the rare specimens of refined and inspiring artwork which are included in that exhibition. And while congratulating you on the success of this, your latest enterprise in this direction, I must not forget to refer in a similar sense to the two earlier exhibitions, each of distinctive character and periods, which also, as I am well assured, were carried out in a most successful and effective manner. In conclusion, I may say that I shall esteem it a pleasure to accede to your courteous request to have my name added to your list of vice-patrons; and on behalf of the Countess of Aberdeen and myself, I again thank you for your kindly words and assure you of our hearty good wishes.

ROYAL SCOTTISH ACADEMY.

THE architectural contributions to the exhibition are not this year, says the *Scotsman*, of outstanding novelty or special merit. They are accommodated, as for some years past, in the small octagon, and form about one-half of the total collection (sixty-nine items) in that apartment. The other exhibits in the small octagon comprise decorative works in black and white, coloured designs for stained glass, small pieces of sculpture and a few interesting examples of enamel work. The works which claim chief attention are those submitted by Sir Aston Webb, R.A., London. They consist of two drawings of the Royal College of Science, South Kensington, and both as regards excellence of design and the manner of exhibiting architectural work are notably of educational value as examples which might be followed with advantage by other members of the profession. There is dignity and restfulness in the composition of the main façade; and while showing a regard for academic proportions, freedom and vitality are evident without any of the eccentricities of some modern art. The large scale drawing of one bay of the college is specially instructive as an example of thorough architectural draughtsmanship. Another excellent work from London is exhibited by Mr. John Belcher, A.R.A. It is the design for the Royal London Friendly Society's new building—a structure of imposing dimensions also, and admirable in its treatment. The profession in Scotland is represented by some good work from Messrs. Honeyman, Keppie & Macintosh, and Mr. James Miller, Glasgow; Peddie & Brown, Edinburgh; and Hippolyte Blanc (who exhibits a fine interior of Troon Church and a elevation in colour of the hospital block, Bangour). John Kinross, R. S. Lorimer and F. W. Deas give by photographs some examples of interesting domestic interiors, with details. Leadbetter & Fairly exhibit a satisfactory design for a mansion house at Roxburghshire, with commendable restraint in its composition, and a competitive design for the Mitchell Library, Glasgow, by Mr. W. Beattie Brown, jun., shows much promise. It has more than once been hinted that the permission to the architects to illustrate their works by photography has led to a good deal of repetition of the same building and especially of interiors. Possibly this might be remedied by limiting the number of views put into each frame. As space is valuable in the small octagon this might not be a disadvantage. In a frame of photographs a series of very successful panels of ceiling decoration are exhibited by Robert Hope.

The Guildhall at Perth is to be taken down and rebuilt. A competition will be organised among local architects.

NOTES AND COMMENTS.

AN experiment is about to be undertaken by M. JEAN PAUL LAURENS, the French painter, which will be watched with interest. For probably there is no other painter in France who would have the courage to attempt such a task. It relates to the ceiling decoration of the Salle des Fêtes in the Prefecture of Saint Etienne. Like other French painters, M. J. P. LAURENS has executed "plafonds" on canvas. At Saint Etienne he proposes to execute in relief the whole of the decorations. As the length of the ceiling is nearly 80 feet it will be evident that the task requires courage on the part of an artist who is a novice in that class of work. Saint Etienne corresponds with our Enfield, for some thousands of workmen are employed in producing firearms for the army. It is remarkable that the artist proposes to demonstrate by his ceiling the horrors of war. In the midst of a fearful struggle a figure of CHRIST is introduced as a contrast, and the whole work will be suggestive of the desolation which will follow from an excess of militarism.

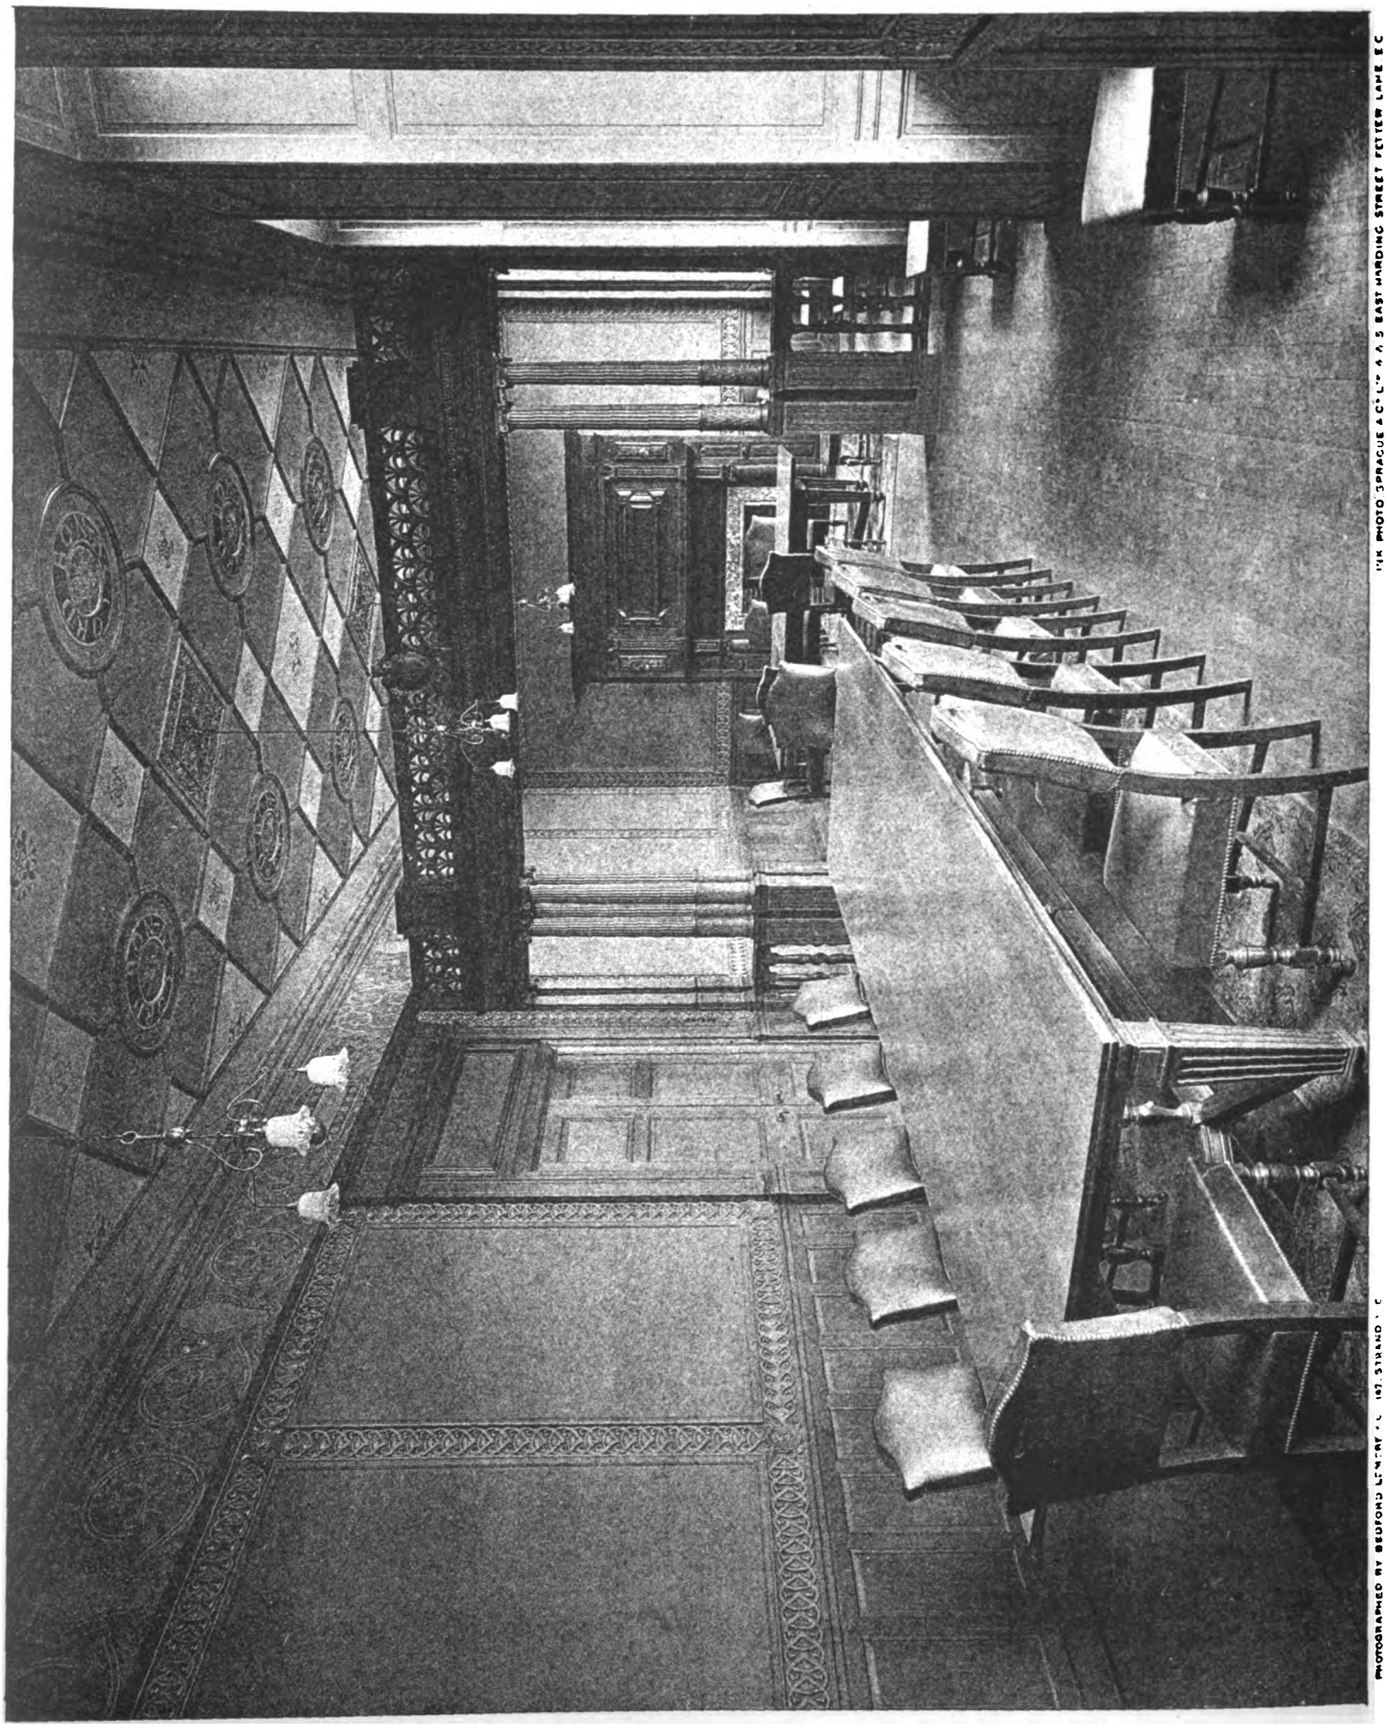
A MAJORITY of the London County Council on Tuesday approved of the proposal of the education committee to erect a secondary school in Dawes Road, Fulham, at a cost of 35,956*l.* This is the first school of the kind to be erected by the Council. It appears that in July 1905 preliminary plans for a school to accommodate 316 scholars on the site were forwarded to the Board of Education. The attention of the Board was invited to the extremely expensive character of their requirements in respect of the building and equipment of new secondary schools, and it was stated that, in the opinion of the Council, considerable economy could be effected without appreciably diminishing the efficiency of the school as a whole. The Board on December 5, 1905, approved the plans as submitted for a total accommodation of 316 girls, and added that it had been decided to modify the regulations of the Board for the building of secondary schools as follows:—"Assembly Hall.—The minimum allowance of 8 square feet per scholar will be reduced to 6 square feet where the Board are satisfied that the larger provision is impracticable. Classrooms.—The minimum allowance of 18 square feet (with the alternative provided by the existing regulations) will be reduced to 16 square feet, provided that the Board are satisfied with the arrangement proposed." These important concessions will enable the Council to effect a considerable saving in the erection of secondary schools. Afterwards it was considered that the school as planned for 316 scholars would be hardly large enough to meet the requirements of the district, and plans were accordingly redrawn for a school to accommodate 510 girls at the estimated cost, including supervision, quantities and lithography, equipment, &c., of 35,956*l.* The cost of the building only is estimated at 28,558*l.*, equivalent to about 56*l.* a place. The cost of the building as originally planned for 316 scholars was estimated at 20,000*l.*, equivalent to about 63*l.* a place.

WHEN a lessor covenants with his lessee that the lessee shall quietly enjoy the premises demised free from any disturbance by the lessor, or by persons claiming under him, how far will the obligation of this covenant extend? This was the question raised by the case of WILLIAMS *v.* GABRIEL. The defendant had leased certain parts of certain premises to the plaintiff, and had covenanted that the plaintiff should quietly enjoy them free from any disturbance by the plaintiff or by any one claiming under him. He assigned the reversion of the plaintiff's lease and the rest of the buildings to another person; and the premises ultimately came into the possession of persons who began to pull them down, with the result that the plaintiff was forced to leave. There had clearly been disturbance of the plaintiff's right to quietly enjoy; but it was held that the disturbance, not having been occasioned by any one "claiming under" the defendant, the plaintiff could not recover against him. In one sense, no doubt, the plaintiff was disturbed by one who claimed under the defendant, for the disturber claimed under the defendant as his predecessor in title. But to make a lessor liable on such a covenant for the acts of one who claims under him, the disturber must claim from such lessor not merely the property, but also the right to do the act complained of. If a lessor, after entering into such a covenant, directly causes or authorises, by his dealing with the property or otherwise, a disturbance of the lessee, he is liable. He is not liable if the disposal of the property by him in no way caused or authorised the disturbance. The lessee must in that case pursue his remedy, if any, against the author of the disturbance.

ILLUSTRATIONS.

CATHEDRAL SERIES.—TRURO: SOUTH CHOIR AISLE.

IN the view of the cathedral we publish this week a part of the former church of St. Mary is seen. It dates from the time of HENRY VII., and had to be incorporated with the cathedral in order to avoid legal difficulties. Truro obtained a charter in A.D. 1175. It was then known as Triueru, which is supposed to be a meeting of three roads. In the time of HENRY VII. it was known as Truro. It was one of the towns selected in the next reign for the repairing of decayed houses, and the operations conducted under the Act 32 Hen. VIII. c. 19, must have been advantageous, for in the course of a few years it was said of Truro that "there is not a towne in the west part of the shire more commendable for neatness of buyldinges."



SCALA THEATRE: FROM DRESS CIRCLE—FROM THE STALLS.

THIS building stands on the site of the Prince of Wales's Theatre, which, under the direction of Mr. and Mrs. BANCROFT, became attractive through its Robertsonian comedies. The building we illustrate was designed by Mr. F. T. VERITY, and, unlike the majority of theatres, whatever is seen is genuine rather than imitative. Pavonazza marble, and not plaster coloured to represent it, is used for surbase columns, pilasters and doorways, bronze for caps, bases and other decorative work, and stone composition resembling Craigleith stone for the wall surfaces. The wood doors are of teak, maple bolection mouldings and maple veneer being used for exposed surfaces. The house is a two-tier one, the gallery being practically a continuation of the upper circle. The dress circle and stalls are approached from Charlotte Street through a spacious vestibule, on either side of which ticket offices and cloak-rooms are placed. The seating accommodation of the house is for 1,400 persons. There are marble staircases on each side of the house connecting the stalls and dress circle, and passing under the two boxes. The plan determined the treatment of the walls, the chief *motif* consisting of a superimposition of Doric and Ionic orders, after the manner of PALLADIO; this has been divided into bays in which the exit doors and boxes are composed as features in scale with the orders; great care has been taken to carry the main architectural lines completely round the auditorium, and to preserve all centres. The proscenium wall is designed in a similar manner; the cornice of the lower order is carried over the arched opening, and the space above filled with a sculptured architectural panel in low relief. The fronts to the circles are formed of gilt-iron railings, presenting a contrast with the stone and marble of the wall surfaces. The construction throughout has been rendered thoroughly fireproof. The general contractors for the work were Messrs. ALLEN & SONS, of Kilburn; the steel construction being carried out by Messrs. RICHARD MORELAND & SONS; the marblework and stone composition by Messrs. FARMER & BRINDLEY, Westminster Bridge Road.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last in the premises at Tufton Street, Westminster, Mr. E. Guy Dawber, president, in the chair.

The following gentlemen were elected as members :—Messrs. E. Dickins, D. W. Rowntree, H. R. Levy, P. M. Stratton, W. F. Edge, G. Robb, J. Dovaston, R. S. B. Wyld, G. S. H. Bradford, E. S. Petch, J. G. Alder, B. J. Boothroyd, C. P. Wade, G. Fitzgerald, F. E. Harris and E. Petre.

On the motion of the PRESIDENT a vote of condolence and sympathy was passed to the family of the late John Pollard Seddon, who died on the 1st inst., and who was one of the oldest and most valued members of the Association.

The Rev. G. H. WEST, D.D., A.R.I.B.A., read the following paper, entitled :—

A Comparison between the Mediæval Architecture of England and France.

The manifestations of art, like all other manifestations of creative energy, physical or mental, human or divine, seem subject to a periodic law, and show themselves in outbursts, separated by times of comparative calm or stagnation. And in the case of art these outbursts seem chiefly to arise either under the impulse of a strong single person, or amongst a community so small and so uniform in the conditions and ideals of its existence as to almost possess an individual personality in its capacity for being moved by a single impulse or a strong emotion. Thus some of the greatest developments of art are to be found under despotic dynasties, like the Pharaohs, the Cæsars, the Arab kings of Spain or India, or under a Solomon, an Attalus of Pergamos, a Louis XIV., or else in societies such as those of Athens, Rome and Florence, which, having just passed through a great national crisis, have entrusted their destinies and the artistic expression of their ideals to a single representative, a Pericles, an Augustus or a Lorenzo de Medici.

There are, of course, infinite differences in the capacity of various races for expressing themselves in art, but, as a rule, when a mixed race is in process of being kneaded together, or when it is beginning to disintegrate, we shall find its art fragmentary or illogical and superficial, for in the one case the individuals have not as yet found any single expression of their common aspirations, and in the other the stream is either spreading abroad into the marshes of decay or has been drained off into countless channels to irrigate each man's separate plot and produce there whatever harvest seems best to him.

Nowhere is the working of these laws more clearly seen than in the history of Mediæval art, its origin, progress and decay, from its rise in the royal domain of France in the twelfth century, when the people, having been welded together by their resistance to the Normans, found in the communes the expression of their newly-attained national life, or in England when Norman and Saxon had just become one under the firm rule of Henry II., and later in the rise of the peculiarly English Perpendicular style after the great war with France—a proof of national vigour which finds no echo in the distracted misery of her vanquished foe. Again, no art so clearly as French Gothic shows artistic genius running to waste during the splitting up of the great guilds into the runnels of the separate branches of architectural art, when each worker, instead of joyfully co-operating in the beauty of the whole, became anxious only to show his own individual skill in the technical perfection of his own work—his stone-cutting, his leadwork or his storied glass.

Of the four great divisions of architecture—religious, military, civil and domestic—each during the Middle Ages comes to perfection in succession, each represents a separate period and state of society, and each generally possesses a distinctive style. But of these our time will not suffice to speak of more than religious architecture, the one which, having its roots planted furthest back in the past, is the first to attain anything like maturity.

When the Roman empire began to fall into decay a special officer had to be appointed to protect the poorer classes against the intolerable exactions of the bankrupt municipalities impoverished by reckless expenditure on unprofitable public works, a state of things not altogether unknown in later times and countries nearer us. When the empire became Christian, the bishop was generally selected as this "Defensor Populi," and gradually, as the last links with the Imperial Government were broken, he succeeded to the position and palace of the prætor, whose judgment hall or basilica became his cathedral. In all cities, therefore, of Roman origin—and they were the great majority in France—the cathedral was not merely a place of worship, but the immemorial abode and symbol of justice and liberty for the poor and oppressed.

And in the north, where the kings of France had already formed the kernel of the nation by driving back the Normans, when in the early twelfth century the rise of the communes bound the people finally into one, their joy and enthusiasm found visible expression in rebuilding their ancient basilicas. The king was delighted to use this new vigour of popular life against his too powerful vassals, while the bishop seized the opportunity to win back to himself and his cathedral the religious fervour of the people, which during the two preceding centuries had been somewhat turned away towards the great outlying Benedictine monasteries by their peaceful energy and active goodness. Thus at Amiens in 1115 we find the bishop preaching a crusade against the Sire de Coucy, the king bringing an army of his own men and the citizens turning out *en masse*, even with their wives, eighty of whom were wounded in an assault on De Coucy's stronghold of Castillon. And by the end of the century we find in every city of the royal domain, which was also a free commune and a bishop's seat, a new cathedral being built by the various guilds of lay workmen, and rising amidst the wildest enthusiasm, men, women and children harnessing themselves to the carts to bring materials for those wonderful shrines—Noyon, Soissons, Laon, Chartres, Paris, Rennes and Amiens.

The French cathedral, then, like the Parthenon, is the material expression of a new-born national life. It proclaims the reliance of the people on their king as the dispenser of justice to all, their trust in their bishop as the administrator of the sacraments of God, their confidence in themselves as the inheritors of the past, and, rising from the very midst of the crowded dwellings, and appealing with countless upraised fingers from earth to Heaven, it proclaims itself the palladium of the city's loyalty, of her faith, her love of liberty.

The plans also of these buildings, while deriving from that of the basilica, show that they are not meant only for the common worship, but they are also great assembly-halls, open to all from end to end, with generally a comparatively small choir, and no solid screen between clergy and people.

Now in England our cathedrals tell a very different tale. From quite early Saxon times the great Benedictine monasteries of the Continent had founded missionary daughter-houses in our land, and even when after the Conquest great churches and cathedrals sprang up in every direction they were all monasteries or in the hands of monks, generally Benedictines, so that, as a rule, the bishop was abbot of the monastery, whose church became his cathedral. Our cathedrals, therefore, generally stand apart from the cities to which they belong, nestled amidst the elms of their quiet close, side by side with the chapter-house, where the monks transacted their business during life, and the peaceful cloister where they slept at last, two buildings hardly ever found now in connection with a French cathedral; for though so-called cloisters did exist in some cases in France, yet they were the dwellings of the secular clergy of the Church, and very early became a tangled mass of tortuous streets surrounded by a wall, not a cloister in the usual sense, and if any of them had still existed—there are remains of something of the sort at Rouen—they would only have marked still more the contrast between the people's cathedrals of the French and ours, which were missionary churches, houses of prayer, telling no story of past popular struggle, no tale of bloodshed, save at Canterbury. Such contrasted views as those of Chartres and Lichfield, Wells and Rouen, sum up completely the stories of the two national churches, and anyone who can remember Rouen as it used to be, with the old houses built against its walls, will be able to realise how completely the French cathedral is the centre of the life of the city.

There can be no more telling contrast than the view of Rouen, with the fortified palace of the archbishop adjoining the cathedral, in the very centre of the town, and that of Exeter from the quiet bishop's garden, with the large-windowed Elizabethan house. The only thing like it in France is St. Ouen, which was a monastery, not a cathedral.

The same story is told by the plans as by the views, perhaps even more clearly. Instead of the great assembly hall of the French cathedral we find in early Norman times the purely basilican plan, single or triple apsed, only very slightly modified.

But when the churches become cathedrals also, and

Digitized by Google

cease to be merely abbeys, they have to serve a double purpose—the Norman apse gives way to an enormously extended choir, which, with the eastern transept and chapels, formed the church of the monks, with a special approach from the cloister; while the western transept, with its chapels and the immense nave, were the cathedral and parish church, cut off from the monks' church by a heavy stone screen, almost an iconostasis, which carried the rood, as at Gloucester and York. This monkish plan is well shown at Lincoln, which when first built by the Benedictine St. Hugh was an almost exact copy of that of the great mother church of Cluny, while later the apse was removed and the eastern portions added.

We shall also find that, whereas the great lay guilds built the French cathedrals and handed down as craft secrets their learning and traditions, so that the constructional development of French Gothic is the result of the severest logical reasoning from first to last, the English cathedrals were frequently built under the direction of the monks, if not actually with their own hands, as at Gloucester, and there is consequently a comparative absence of scientific tradition, much less coherence in purpose and expression, but more individuality and local originality, and while French traditions grow stronger and more binding as the art falls more and more into the hands of a small professional class, and become less and less the expression of popular feeling till it dies stifled by the swathing bands of invariable formulæ, English architecture, less popular at first, but freer in its efforts and expression, comes always more and more into touch with the national sentiment, and finally develops an entirely new form, which never really died, but, adapting itself to the social evolution of the nation, gradually ceased to be chiefly ecclesiastical, and, deserting the cathedral and the monastery for the village church and the crenellated manor, at last, under the Tudors, gave rise to the domestic architecture of that sturdy middle class which has always been the backbone of the English nation; so that while France was rearing Renaissance châteaux for her wealthy nobles, the English squire and his tenants, still side by side as at Crecy, were going on building their country houses and farms on the old lines, adding a new aisle to the parish church, raising a grammar school in the village street, or providing a new college at Oxford or Cambridge to receive its boys.

Thus much as to the influence of the history of the two nations on their art. Let us now turn to its constructional development in each case, beginning with France.

From the time when Christian art began to revive after the fall of the Roman empire, the efforts of all builders in the ancient imperial provinces of Western Europe had been centred in the attempt to do with small materials and a limited supply of unskilled labour what the Romans themselves had never even attempted with building resources such as the world has never seen before or since—to cover the three-aisled basilica, which by long use had become the recognised form for the Christian church, with the stone or concrete vault of the great halls of the Roman baths. The intersecting vault could be managed over the small square compartments of the aisles, but was quite beyond the power of these early builders for the high vault of the nave, while the continuous thrust of a barrel-vault, unless the three aisles were kept of equal height as at Champdeniers, brought all to ruin before long.

By the beginning of the twelfth century it had become obvious that if the problem was to be solved some means must be found for concentrating the thrust upon certain points, preferably upon the corners of a square, either, as at Périgueux, by a series of domes on pendentives, or, as at Vézelay, by the regular Roman intersecting vault. This was the form which ultimately prevailed, for it was a fairly obvious step to work from centrings placed under the angles of the intersecting cylinders, and to get over the difficulty, insurmountable to these early builders, of getting the proper ellipse given by the intersection of two semicircular vaults in one of three ways—either by making the intersecting centrings semicircular and then building a dome round them, as in Aquitaine; or by piling earth on the top till the vaults themselves also became nearly semicircular, though still domical, as at Vézelay; or, as at Durham, by making the centrings segmental. It was at Durham, in England, and a little later at St. Denis, in France, that the great step was made which gave birth to Gothic of making these centrings of stone and leaving them as a permanent support to the vaulting panels, and letting each panel be separately supported by the centrings or ribs. But undoubtedly this intuition was in the air when Flambard and Suger used it, just as printing was when Gutenberg began to work, the steam-engine when Watt and Stephenson took up the ideas of Newcomen and Trevithick, as the electric light and the telephone were in our own day. In it lies the key to the history of all later Mediæval architecture. After St. Denis all French churches exist by and for the vault, the plan of which is in the mind of the builder from the moment when the first stone is laid. It took some time for it to be found out how great the thrust is even of this form of vault, but that abutments are needed only at the springers. This abutment was given at first in the simplest way, as at Durham, by a complete arch over the triforium carrying its roof, and later by a quarter arch butting against the springing, as at Gloucester and the Abbaye aux Hommes at Caen. But it was soon found that these arches should abut higher, and when the triforium became a mere passage they were left outside the roofs and became continually more complex, passing from the simple forms of Chartres to the extremely elaborate and beautiful ones of Amiens and St. Ouen. The principle once admitted of allowing all the constructional parts of a building to be exposed to the weather, nothing can be more perfectly thought out than the French cathedral, where the walls have formed "fours deep" and the thrust of the great vault is carried down to the main buttress by an arch. All the intermediate spaces are mere screens of storied glass, and nothing can be more perfect in its beauty. But, as always in human work, only for a moment did these stern reasoners and perfect artists rest on the summit, and Beauvais is a literal example of that "vaulting ambition which o'erleaps itself." The chiefly passive *rôle* of the buttresses of Amiens in transmitting the vault thrust must be exchanged for an active one, which shall enable the main buttresses to be smaller and the whole building lighter, though even higher, than Amiens.

Let us examine this supreme but splendid folly of Beauvais. In the section E are the piers; on G, their capitals, stand the vaulting shafts; K is the buttress of the triforium, corbelled out somewhat towards the aisles, but leaving the aisle vault quite free; A are two colonnettes, replacing the single one of Amiens, carrying a lintel L, on which are two more short colonnettes, increasing the size and weight of the *tas de charge* or horizontally-coursed springer of the vault, and carrying the head of the flying buttress, which butts against a huge stone, M, heavily weighted by a cornice, pedestal and enormous statue, in front of which are two more columns carrying the great pinnacle above the upper buttress, which charges its head. The more settlement there is towards the interior, where the chief settlement always takes place, the more will these long, stiff columns push up the heads of the lintels L and M and resist the thrust of the vault, provided the columns are strong enough not to break under the strain. To add to this passive counter thrust the architect of Beauvais boldly—too boldly—added an active resistance. The intermediate buttress pier O carried by the aisle pier P is corbelled out half its thickness towards the interior, so that if it were not for the two flying buttresses above it would fall against the cathedral wall, and it is finally stiffened by the two small buttresses S and T joining it to the main buttress pier. But the colonnettes cracked, the lintel L gave, and the blocks M pressing against the flying buttress made it buckle, and nearly the whole had to be rebuilt differently.

Such is the extreme expression of French thirteenth-century Gothic, but while the vault thus dictated the exterior forms of the building, it affected the interior hardly less. The monocylindrical columns, with great voluted capitals derived from Classic times, were soon felt to be unsuitable, as so much of their upper surface was left unused and the arrangement illogical. So in the later columns of Notre-Dame the pier arches have their own column, with a capital of one course, and the main vaulting shaft is the continuation of another column rising from the ground and having its capital at the vault, and the original main column, with a capital of two courses, appears behind these. We thus have the principle of continuity distinctly formulated—that every arch must have its own column, that every column must have its base on the ground and its capital at the springing of its arch. Soon it was felt that every colonnette should have members corresponding to the mouldings of its arch, and so by a gradual transition, which may be well traced at Notre-Dame de l'Epine and St. Ouen, it came to be felt that the capitals had lost their meaning and that all mouldings of all arches should run down to a common base without a break, sometimes dying into one another on the

Digitized by Google

way, as at St. Maclou, but reappearing below, even if their reappearance was marked only by the corners of their imaginary bases supposed to exist inside that of the main pier, but to have been turned round so that their corners project from the face. Though ugly and wearisome in its latest examples, the better specimens of this last French style are many of them singularly beautiful, as is St. Wulfram, at Abbeville, and the smaller details of these churches are often exquisite, like the organ staircase of St. Maclou and its wonderful porch.

To turn now to English architecture. We have already seen how different its history is from that of the French, and its aim and final results are not less different. The two follow divergent paths except during a portion of the thirteenth century, when French influence here was considerable, though not easy to define. First of all is to be noticed in the plan the tendency to bold, square projections and the square east end, both of which may safely be attributed to the persistence of Saxon traditions. We have several stone Saxon churches left, but the great majority were undoubtedly of wood, and in a wooden building, especially if large timber was used, as was sure to be the case in a land so covered with primeval forest as England then was, the projections would naturally be much bolder than in a stone one. Such a church as Borgunds, though itself of late date, doubtless represents older buildings, which, to judge from the Bayeux tapestry, must have been very similar in England. For a time this Saxon tradition was obscured by the Lombardic or basilican plan, with three parallel apses or one single one, used by the Normans in Italy, and probably derived by them from the remains of the Roman building guilds, such as that at Como. English tradition, however, soon reasserted itself, and was finally fixed by the great influx of Cistercians in the twelfth century, whose churches invariably had square east ends. One other peculiarity of the English plan, the great length of the nave, is probably due to the narthex of Cluny, the influence of whose plan we noted at Lincoln, being taken into the church. We have only one instance—Ely—of its persisting in its original form, the Galilee of Durham being hardly a case in point.

(To be concluded.)

QUEBEC ARCHITECTS' ASSOCIATION.

THE annual meeting of the Province of Quebec Association of Architects was held at the Château Frontenac, Montreal, on the 20th ult. The following delegates attended from Montreal:—Mr. J. S. Archibald, president; Mr. J. E. Vanier, secretary; Mr. D. R. Brown, treasurer; Messrs. R. Lacroix, A. Chaussé (city building inspector), J. R. Gardiner, C. Dufort, C. S. Burgess, A. A. Cox, J. Venne and Contant.

At the morning session the following officers were elected for the current year:—President, Mr. A. Chaussé; first vice-president, Mr. R. P. Lemay, of Quebec; second vice-president, Mr. D. R. Brown, of Montreal; secretary, Mr. J. E. Vanier, of Montreal; treasurer, Mr. J. R. Gardiner, of Montreal; board of directors, Messrs. J. S. Archibald, Professor Nobbs, of McGill University; R. N. MacVicar, J. Venne, C. S. Burgess and J. P. Ouillette, of Quebec; auditors, Mr. R. A. Decary, of Quebec, and C. Dufort, of Montreal.

The programme included an afternoon session and a banquet at night, but immediately after the election of officers the meeting adjourned out of respect to the memory of the late Hon. R. Prefontaine. It was decided to hold the next annual meeting in January 1907 at Montreal. Mr. J. S. Archibald was appointed president of the delegation to attend the International Congress of Architects to be held in London in July next. The delegation will include Messrs. A. Chaussé, A. F. Dunlop, D. R. Brown, J. Venne and others.

NEWARK CASTLE.

IN the latest report of the Glasgow Archæological Society some correspondence is printed respecting the steps that have been taken for the preservation of the ruins of Newark Castle. Mr. J. D. G. Dalrymple, the president of the Society, wrote to Sir Hugh Shaw-Stewart, the owner of the castle, inquiring if nothing could be done to save the edifice from ruin. In the course of his reply, Sir Hugh said:—

I share the regret of the Glasgow Archæological Society that the building is in such a condition of ruin, but I wonder if the Society has calculated the amount which would be necessary to place it in thorough repair, and I also wonder if they have any idea of the periodical sums that even now have to be laid out, and were laid out during my father's lifetime, in keeping the roof water-tight and in preventing the building falling into greater ruin than it is now. This latter aim has not been lost sight of for many years past, and last month I gave orders for further expenditure upon the roof, but with the enormous calls for expenditure in all directions which fall upon a landowner, and, in my case, having to find a very large sum for payment of death and succession duties, it is quite impossible for me to lay out more money than I do on Newark Castle without starving other buildings which are a source of livelihood to those who occupy them as farm tenants, &c. So far from being indifferent to the value of a building of architectural and historical interest, I lately refused a tempting sum for the purchase of the ground on which it stands in order that a shipbuilding yard might be erected there. If the Glasgow Archæological Society would like to provide funds for the thorough repair of Newark Castle, I should place no obstacle in their way, but to provide a sum adequate for the purpose myself would be to neglect obvious duties which are cast upon me in other directions in regard to buildings which are of value and interest, not to the past, but to the present and future.

THE USHER HALL MUDDLE.

TEN years ago the late Mr. Andrew Usher, a distiller, gave 100,000*l.* to the Edinburgh City Council for the erection of a hall. The building has not been erected, but a sum of about 30,000*l.* has been expended, mainly on the purchase of an old Synod hall. That was to be demolished and used for a site, but afterwards it was proposed to retain the buildings and to erect some sort of hall in the rear in order to escape the risks of neglecting to carry out the donor's intention. As the muddle has become more perplexing Mr. Thomas Hunter, the town clerk, has been instructed to prepare a report on the whole subject. According to the *Scotsman*, Mr. Hunter says that the fact has to be reckoned with that the Corporation have acquired and now hold the Synod hall premises and adjoining properties for the purposes of the hall and offices in terms of Mr. Usher's trust-deed and the Order of 1903. If the Town Council are not prepared without delay to decide upon the permanent treatment of the site, so as to carry out these purposes most effectively, they should fit up the halls and the premises connected with them so as to allow these to be used as far as their capabilities go, and from time to time let them for the purposes intended.

Discussing alternatives, Mr. Hunter says in the event of the existing buildings being retained without extension, but with internal reconstruction, the properties acquired on the other side of the lane since the purchase of the hall might be disposed of. At least, the Usher Bequest should be relieved of their cost, and the proposal to enlarge the present buildings by taking out the back wall and erecting additions behind would also allow the front elevation to be retained. The abandoned scheme, under which it was proposed to demolish the Synod hall and the reconstruction of a new building, is recommended for careful consideration; and the fourth alternative dealt with is the erection of the hall on the Lothian Road school site. In regard to this proposal, Mr. Hunter points to the lack of information concerning this proposal, and lays stress on the fact that for the purchase of the properties concerned compulsory powers would require to be obtained failing purchase by agreement. It is not open at present, Mr. Hunter points out, to contemplate the abandonment of the present site and the selection of a site in another part of the city. That would require another Act of Parliament, and if compulsory powers of acquisition were wanted, there might be difficulty in obtaining these from Parliament in the event of opposition being offered. Should a change of site be even contemplated, therefore, it would be almost necessary to show that the new site could be acquired by agreement at an ascertained price; and apart from that point, the Town Council, before taking any steps in the direction of acquiring another site, should have before them a definite scheme, showing how the proposed site was to be utilised, and comparing its advantages and cost with those of the alternatives before mentioned. For the present purpose it may be sufficient to repeat here that a change of site to

Digitized by Google

another part of the city is not one of the alternatives at present open.

The sum received from Mr. Usher in 1896 was 100,000*l.* By Whitsunday 1897, it had become apparent that there was going to be difficulty and delay in finding a site, and it was then the duty of the trustees to invest the money in trust securities, and not allow it to lie indefinitely for a long period in bank. The Corporation were at that time making an issue of 750,000*l.* Two-and-a-Half per Cent. stock redeemable at par after thirty years (which was fully taken up), and Mr. Usher's money was invested in 102,900*l.* of the stock, at the net price of 98¾ per cent. The lenders got the Corporation obligation for payment of the full capital sum—102,900*l.*—at maturity of the stock, with 2½ per cent. interest annually until then. No necessity has yet arisen for realising any part of the stock, and none of it has been realised. From the issue in 1897 down to May 1902, sales of the 2½ per cent. stock by outside parties took place at prices varying from a little over 100*l.* per cent. to 95*l.* per cent. Since then, only sales of small holdings have taken place, and these have been at prices varying from 85*l.* 15*s.* to 77*l.* 15*s.* per cent. The money market will no doubt return in ordinary course to higher rates, and sales may take place at or near the price of issue. Should the Town Council decide to go on with a building scheme, and the money invested in the stock be required, the trustees may surrender the stock to the Corporation at a price to be agreed upon, instead of selling it in the market. In that case, it would be equitable in the circumstances for the Corporation to redeem it at a price equivalent to the sum which they actually received for it on the date of issue, which would be less than they would have to pay at maturity. At Whitsunday next the Corporation will have provided in the loans fund a sum of 225,000*l.*, as against the redemption of the 2½ per cent. issue of stock, and there will be a further instalment of 25,000*l.* added to this annually. There have been several intromissions with Mr. Usher's money. A sum of 52,300*l.* 17*s.* 6*d.* was paid for the Synod hall and offices, for properties in Grindlay Street and Cambridge Street, including compensation to tenants, and for preliminary expenses in connection with the erection of the new hall. From this there has to be deducted 20,511*l.* 3*s.* 4*d.* received in interest and rents, leaving a balance of 31,789*l.* 14*s.* 2*d.*, which was met by temporary advances from the Common Good and from the bank. So long as no further capital expenditure is incurred the net revenue for the current and future years will go to reduce this balance. In the event of the Town Council deciding to restrict the new hall and offices to the area of the present hall, the trust money should be relieved of the cost of the other properties or credited with the value of these, in which case the balance of the temporary debt would be considerably reduced, thus leaving the bulk of the original capital fund intact. About 600*l.* is being expended upon cleaning and repairing the hall and offices, but that will be charged upon the rents drawn for these premises. With the 31,789*l.* deducted from the original sum there now remains of the 100,000*l.* a sum of 69,824*l.* 0*s.* 10*d.* at the credit of the account at this date. As the temporary advances are reduced by payments out of revenue, that balance will be increased. Up to date the interest received on investments has amounted to 23,360*l.*

PUBLIC MONUMENTS IN EDINBURGH.

THE sub-committee of the Lord Provost's committee of Edinburgh Town Council have had under discussion a motion as to what should be done to restore and preserve the public monuments of the city. It was stated with reference to the Scott Monument that though it might be considered in fairly good order there were parts which required attention. The stonework would have to be carefully gone over, and any parts that required it judiciously painted. Owing to exposure the marble figure of Scott had now a granular surface, which would have to be removed by careful scraping or filing, after which the figure would have to be repolished. The same treatment would have to be given to the marble figure of Allan Ramsay, which, owing to its more exposed situation in Princes Street Gardens, was black and discoloured in parts. In connection with the Burns Monument on Calton Hill, the report stated that the stone showed signs of increasing waste. Some years ago portions of the more delicate parts were found to be obliterated, and they were renewed with cement-work. Now, however, it would be advisable to effect any renewals of this description by stone insertions. The Livingstone Monument, the Adam Black, Wilson and Simpson memorials in Princes Street Gardens, it was further stated, would require to be thoroughly washed and polished; the bronze figure and the granite stonework of the Prince Albert Memorial in Charlotte Square, the Chalmers, Pitt and George IV. monuments in George Street would have to be similarly treated. The Dugald Stewart Monument on Calton Hill was in need of attention, particularly the panel, and the inscription required recutting. A considerable amount of pointing required to be done on Nelson's Monument, but though some portions of the rock below it were found to be wasting, it was not necessary to deal with it at the present time. The committee agreed to recommend in terms of the report, with the further recommendation that expert advice be taken as to the manner in which the marble figures of Scott and Ramsay should be treated.

COMPETITION IN AMERICA.

ONE of the subjects considered at the convention last month of the American Institute of Architects was competitions. The state of opinion among the members may be inferred from the following speeches :—

Mr. George B. Post said :—I was not one of those scheduled to take part in this discussion, and consequently what I say must be absolutely without preparation. I am sure we shall all agree without a dissenting voice that a far better result is obtained by election of an architect than by competition. But at the same time we must realise that from the time the boy goes to the architectural school until he goes to the office to practise as an assistant his entire life is one of daily and perpetual competition, until competition is so thoroughly inbred into his composition that we cannot eradicate it in practice. Therefore I think we must accept competition as a necessary evil, and then to use our utmost exertions as individuals and as an institute to see that competitions are properly inaugurated and conducted, and that the awards are made with fairness and propriety.

Personally—and I speak it with considerable experience in the matter of competitions, for I have during the rather long periods of practice erected over fifty million dollars' worth of buildings, and the greater part of it was gained in competition—I have not altogether a perfect reliance on the ordinary expert jury. Except in the matter of competition for a design like that of a great monument, which is purely artistic in character, the expert should always be a practising architect, or several practising architects, who know the practical solutions possible, and who can see as the theorist cannot see, the whole problem as controlled by the practical considerations. I believe in the wisdom shown by the board of directors with regard to the Cook County Court-house competition, in stating the facts of the competition and giving the names of the participants, and then adding that these facts are published, and nothing more.

Mr. John M. Carrere said :—I want to start by pleading guilty. I have entered a great many competitions. I cannot tell you the exact number, but I think in my twenty-one years of practice I have entered over forty. What that means in time and labour and money you can judge from the statements made to-day. I have won five. I cannot say that it has been a profitable investment. Neither do I feel that I would not have arrived at the same end without going into these competitions. The spirit of competition, of friendly and legitimate competition, is born in us through the methods by which we work, and though there will always be competitions, and rather discouraging competitions, we should try to make them fruitful. There can be only a few reasons for a competition. One is the desire of the practitioner to increase his practice, and I think that is admittedly a failure. The same amount of effort, money and skill spent in other directions would produce better results. The other reason is to obtain the very best design, and I fail to see in this country or any other country that the most noted competitions have brought about results which could not have been obtained by direct selection. A third reason which is prevalent and which is natural is the desire to discover new talent. I do not sympathise with that at all. If a man has talent his day will come, and it should not come until he is prepared to make use of it. A man who has genius to express his original ideas should be entrusted with nothing more than the presentation of them on paper, but when it comes to the serious work of actual business that requires not only the experience of the practical side of things, but the

Digitized by Google

practical artistic experience, the experience to know that a thing that is on paper represents a thing that is going to look well in execution; and that refers to every detail of the plan, the very texture of the material. That requires practice, and cannot be acquired by any man, no matter what a genius he may be, without practice.

If competitions are to be conducted as has been stated to-night the most important element lacking is the ability of the architect to get into touch with the problem through his client and evolve a solution. The danger with a system of competitions for the Government work is that it establishes an official type of architecture, which would not be the case if the men would start their design without the idea of winning the prize. To particularise. I do not believe there is a successful example anywhere in the world of a monumental building in which an order is the main feature unless there are two storeys. Now, the Government type requires four, five and six storeys, and our architects are obliged to crowd innumerable storeys into that order. But if I were invited into any such competition I would put in more than two storeys, and I have myself decided that way because it seemed the best solution presented. As I look around me in this country, and pick out the buildings which to me seem most successful, I do not believe that the great majority of those buildings would have won the prize in any competition. For example, I need not tell you that I would be satisfied to have McKim, Meade & White build every building in the country. I am a great admirer of the University Club. But can you imagine a drawing like that presented in a competition and winning a prize? I cannot.

The special committee offered the following suggestions:—

1. The object of the competition should be to secure the most skilled architect as shown by the schemes which he presents.

2. An architectural adviser should draw up the programme, and advise the owner in relation to technical questions in making the programme, selecting the scheme and the architect.

3. The amount to be expended on the work should be sufficient within a reasonable margin to erect a structure of the character and size indicated in the programme, or there should be no cost price stipulated.

4. The programme should be in the form of a contract which guarantees the employment of the successful competitor to make the drawings for and supervise the work of the proposed structure at a proper remuneration.

5. All competitors who have notified the owners of their entering the competition should meet and, after discussion with the owner, agree upon conditions which will be binding upon the owner and the competitors.

6. Payment of competitors in a limited competition should be guaranteed sufficient to cover the preparation of the drawings demanded, and prizes or premiums in open competitions to cover such expense for at least the five best schemes.

7. The minimum amount of drawings should be required to express the design and arrangement.

PUTNEY SCHOOL OF ART.

THE committee of the Putney School of Art have intimated that it has been unanimously resolved to request the London County Council to take over the school. The school is situated at the corner of Oxford and Disraeli roads, Putney, and the building and freehold of the site are the property of Mr. W. J. Lancaster, from whom the school committee rent the building at a fixed annual rent of 125*l.*, which represents 3 per cent. on the sum of 4,187*l.*, which was the actual expenditure incurred by Mr. Lancaster for the site and buildings. The school committee have also the option of purchasing the freehold of the premises from him for the above-mentioned sum of 4,187*l.* on giving three months' notice at any time before Michaelmas, 1916. The premises are not at present rated, but if at any time they become rateable this additional expense would fall on the Council. Having regard to the state of the money market, the present time is not considered a favourable one for the purchase of the freehold and site. The rent of the premises is a reasonable one, and therefore the Council might with advantage conduct the school and rent the premises on the same terms and conditions as those under which it has been conducted by the present school committee.

The accounts approximately balance, the receipts being 938*l.* on the present scale of grants and the expenditure 928*l.* 10*s.*, omitting all questions of new equipment or repairs other than expenditure on normal repairs. It is probable that under the Council the expenditure on printing and advertising will be increased, but a considerable increase in the number of students may also be anticipated. There are about 100 students in attendance at the evening classes, thirty-eight at the morning and twenty-nine at the afternoon classes. The education committee having recommended that the offer of the committee of the Putney School of Art to transfer the school to the Council be accepted upon conditions similar to those at present in force, it was referred to the Council's officers to prepare the necessary documents in connection therewith, and that the seal of the Council be affixed thereto if necessary. The Council on Tuesday agreed to the arrangement.

TESSERÆ.

Hogarth's Line of Beauty.

AN inspection of nature and art, and especially of the human figure, has generally produced the conviction that the line of greatest grace and beauty is not any of the curves treated of in geometrical works, but a waving line or bicurve, which is well known by the name of Hogarth's Line of Beauty, or the ogee or cymatium of architecture. And, indeed, to be convinced of its beauty nothing more is necessary than to inspect any object whose contour is felt to be peculiarly beautiful, such as the axial line of the human figure when in a graceful attitude, or the outline of any part of the human form that is eminently capable of beauty: the mesial line of the back, the form of the bosom, the arms, the legs, the hands, the feet, the head, neck, brow, eyes, mouth, nose, cheeks—in a word, any beautiful part. It will be found to have its contour defined by waving lines such as have just been described. In like manner let the form of any animal remarkable for its beauty be inspected, as, for instance, an Arabian horse, a greyhound, a swan, a peacock, a dove, a fish; they will all be found, so far as they are beautiful, to be defined by the waving line, or a part of it, varying in curvature perhaps, but not at all in nature. The forms of those beautiful artificial objects also which owe their beauty to their contour, such as Greek and Etruscan vases, arabesques, scrolls, and tracery in architecture and on furniture, foliage, and flowers, and almost all the ornaments of Greek architecture, will all be found to owe their beauty to the same bicurve under some form or another. The elements of beautiful landscapes also, such as the outlines of hills, the courses of rivers, the margins of lakes, or the sea-shore—in a word, wherever there is a peculiar grace or softness of aspect in any object, whether of nature or art, the bicurve which has been described will be found to enter into its composition. This, however, is no new principle, but has already been fully developed, and, indeed, pressed a great deal too far by Hogarth in his "Analysis of Beauty," and has since his day been generally assented to as far perhaps as it ought to be.

Dante and Giotto.

Giotto falls by right into Dante's circle, as one great man comes naturally to know another. But he is said actually to have lived in great intimacy with Dante, who was about twelve years older than himself; Giotto having been born in or near the year 1276, at Vespignano, fourteen miles from Florence. He died in 1336, fifteen years after Dante. On the authority of Benvenuto da Imola (an early commentator on the "Commedia"), of Vasari, and others, it is said that Dante visited Giotto while he was painting at Padua; that the great poet furnished the great painter with the conceptions of a series of subjects from the Apocalypse which he painted at Naples; and that Giotto, finally, passed some time with Dante in the exile's last refuge at Ravenna. There is a tradition that Dante also studied drawing with Giotto's master Cimabue, and that he practised it in some degree is evident from the passage in the "Vita Nuova," where he speaks of his drawing an angel. The reader will not need to be reminded of Giotto's portrait of the youthful Dante, painted in the Bargello at Florence, then the chapel of the Podesta. This is the author of the "Vita Nuova." That other portrait shown us in the posthumous mask—a face dead in exile after the death of hope—should front the first page of the Sacred Poem to which heaven and earth had set their hands, but which might never bring him back to Florence, though it had made him haggard for many years.

Digitized by Google

Giotto's canzone on the doctrine of voluntary poverty—the only poem we have of his—is a protest against a perversion of Gospel teaching which had gained ground in his day to the extent of becoming a popular frenzy. People went literally mad upon it; and to the reaction against this madness may also be assigned (at any rate partly) Cavalcanti's poem on poverty, which is otherwise not easily explained if authentic. Giotto's canzone is all the more curious when we remember his noble fresco at Assisi of Saint Francis wedded to Poverty. It would really almost seem as if the poem had been written as a sort of safety-valve for the painter's true feelings during the composition of the picture. At any rate, it affords another proof of the strong common sense and turn for humour which all accounts attribute to Giotto.

Wren on Church Building.

When the Act for building fifty new churches in the Metropolis was passed Wren was appointed one of the commissioners for carrying it into execution. Preparatory to entering on his new appointment, he communicated his opinions to one of his brother commissioners upon the best manner of conducting this important business. This document, which is very long, consisting of eight sections, with a proemium and conclusion, is given at length in the "Parentalia." It begins by stating that since Providence in great mercy had protracted his age—his seventy-eighth year—to the finishing of the Cathedral of St. Paul and the parochial churches of London, all of which were executed during the fatigues of his employment in the service of the Crown for so many reigns, and being constituted one of the commissioners for building fifty more churches in London and Westminster, he presumed to communicate his sentiments, after long experience. He advised that the new churches be built not in the extremities of the suburbs, but among the thicker inhabitants, even if the ground should cost more. He wished that all burials in churches should be disallowed, as being not only unhealthy, but that the pavements could not be kept even nor the pews upright; and if the churchyards were close about the church it would be bad, because the ground being continually raised by the graves would cause in time a descent into the church by steps, which renders it damp and unwholesome, and causes the walls to be green, as seen in all old churches. In reply to a question where shall be the burials, Wren answers, in cemeteries in the outskirts of the town, where two acres would cost less than two roods among the buildings. He also discusses the best situations, forms, ornaments and materials, as stone, lime and brick, which latter material he proves from ancient ruins could be made as good in London as in ancient Rome if properly managed, although those made for the thousand and one houses hastily run up after the fire would scarcely bear the slightest weight. In this discussion Wren takes occasion to mention, incidentally, the superiority of stone-lime over that burned from chalk, then and subsequently so much used in London, from its contiguity to the chalk cliffs of Kent and Essex. The vaulting of St. Paul's, he says, is coated by a rendering as hard as stone, composed of cockleshell lime and sand well beaten, and the more labour in the beating the better, and the mortar the better. Churchwardens, he says, may be careless in speedily repairing drips, but they will usually whitewash the church and set up their names, but neglect to preserve the roof over their heads.

Galleries in Buildings.

In architectural language a room can hardly be called a gallery unless its length be three times its width, for else, though as a room it might be considered long, as a gallery it would be short; therefore, if a spacious apartment, it would answer to the character of a hall, as is the case with the Waterloo Gallery in Windsor Castle, whereas the adjoining St. George's Hall might more appropriately be termed a gallery, its proportions being those of one. On the contrary the Victoria Gallery, in the Palace of Westminster, is, according to the architect's admission, avowedly a hall, and not a gallery, its dimensions being 100 feet by 45, consequently an architectural misnomer has been intentionally given to it. But though the length of a gallery as compared with its breadth ought not to be less than what has been stated, it may be increased to any extent without danger of excess, unless the gallery should thereby be rendered far too pompous and spacious to be at all in keeping with the other apartments, as was generally the case in Elizabethan mansions. The proportion as to height in galleries is regulated solely by width, which may be nearly equal to each other, the height being a little more or less than the breadth, according as the ceiling is arched or flat, because the height being the same, the walls will be lower in the former case than in the other. It is to be observed, however, that a very long gallery will bear to be somewhat loftier than one of moderate length; at the same time it must be borne in mind that the height must not be such as to occasion the effect of narrowness and produce the proportions of a mere corridor. Very low proportions, on the contrary, rather than height are one characteristic of galleries of the Elizabethan period, so much so that some of them look quite depressed by their heavy flat ceilings, whereas halls in the same buildings are frequently disproportionally high owing to their occupying two storeys of the building, and being, besides, sometimes not twice their width in length. There is hardly anything in the interior of a building which lends itself so readily to architectural effect as a gallery, since, if it at all answers to its name, there will at any rate be that of lengthened perspective and vista. In fact, the very name itself excites expectations of superior design and taste, because rooms of the kind belong to the luxuries of architecture, and are rather intended for state and display than for any actual use as rooms, except on extraordinary occasions. Hence galleries are by no means common even in spacious and sumptuous mansions, consequently it very rarely happens that an architect has an opportunity of exercising his talent for interior design upon what holds out so much scope for the display of it, and this, no doubt, is one chief reason why the subject itself is so slurred over in professional treatises, for it certainly does lie quite out of the track of everyday practice.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

AT the rooms of the above Society on Thursday, the 8th inst., Mr. H. Percy Adams delivered a lecture on "Sanatoria," Mr. W. H. Thorp in the chair.

Mr. Adams, in dealing with the general principle of a sanatorium, remarked that such institutions should serve two purposes—the healing of patients suffering from lung diseases, and also, that they should act as schools where people were systematically taught the value of fresh air and cleanly habits, so that when the patients left and were distributed among the community they should spread the knowledge so acquired as well as practise it in their homes. Therefore such an establishment should be a model of hygienic requirements. Sanatoria might generally be divided into two classes—the American or cottage type, and the concentrated or hotel type. He expressed the opinion that for the accommodation of anything like one hundred patients the hotel type of sanatorium was a practical necessity, but for small establishments of about twenty beds the cottage type was probably the best from a purely medical point of view. No sanatorium built in England on the cottage plan had more than twenty beds, but on the Continent they sometimes had more than fifty patients. He argued that there was no economy in erecting buildings of a purely temporary character because there was so much in common between such structures and those of a permanent character. Speaking of the Germans as having been the pioneers of these institutions, many of which had been erected by the insurance companies, Mr. Adams showed views and plans on the screen of a number of these institutions, many of which he had visited, and gave many details of their arrangements. He then proceeded to give the history of the movement which resulted in the conception of the erection of the King Edward VII. Sanatorium, of which he is the architect, and gave many details of the structural features and arrangements of the establishment now approaching completion at Midhurst.

Mr. E. R. Dolby, engineer, of Westminster, who has been associated with Mr. Adams in the erection of the King Edward VII. Sanatorium, described details of the heating, hot-water service and electrical arrangements of the Midhurst Sanatorium.

A vote of thanks to the lecturers was proposed by Mr. Butler Wilson and seconded by Mr. H. A. Chapman.

Mr. Alfred Robert Finch has been appointed borough engineer and surveyor of Kensington, in place of Mr. William Weaver, who resigned after forty years' service.

Correspondence

An Aisleless Church.

SIR,—In reply to Mr. Mackrell's inquiry in last week's issue respecting a church built in or near London without pillars, I beg to refer him to three which most readily occur to the memory, St. Paul's, Knightsbridge, St. Gabriel's, Bromley-by-Bow (neither of which, however, can be held up for imitation or admiration), and the nave of St. Etheldreda's, Fulham.

I may be wrong, but I take it that your correspondent is desirous of meeting with a church so planned that the whole of the congregation may be within view of the high altar. In illustration of this permit me to draw his attention to one of the most remarkable churches that have been built in the neighbourhood of the Metropolis since the ecclesiological movement—St. Faith's, Londesboro' Road, Stoke Newington. Begun in 1872 from the designs of William Burges, and conceived in his style of predilection—northern French of the latter part of the twelfth century—it was partly finished in 1873, and, its distinguished designer having passed away in the interim (1881), was carried on to completion ten years later under the direction of the late Mr. James Brooks.

What Burges's model was for St. Faith's, Stoke Newington, I cannot state with precision, but the three buildings which, it is not improbable, he had in his mind are the chapel in the Archbishop's palace at Reims, the *pourtour* of the choir of St. Jean at Sens, and the graceful early thirteenth-century church of Nun Monkton, near York. It consists of a nave and chancel, the latter ending in an apse of noble sweep, all contained beneath one line of simply-coved roof, possibly inspired by that at Tillard, near Beauvais, in the Department of Oise. In lieu of aisles there are low and very narrow passages, or *Vomitoria*, formed in the thickness of the walls and opening into the broad nave by triplets of pointed arches on transversely coupled columns with boldly foliaged capitals. Along the top of these arcades runs a continuous triforium gallery lighted by very tall lancet windows arranged in pairs, and affording a noble field for the display of stained glass on the model of that at Canterbury, Auxerre, Sens and other great northern Early Pointed churches. Unfortunately such stained glass as has been inserted in the church is quite alien to the spirit of its architecture. Above a very imposing double doorway in the turret-flanked west end is a rose of grand dimensions.

The apse of this church viewed from the north-east is very striking, and quite unlike anything else with which I am acquainted in or about town. It may be mentioned that about twenty-five years earlier Mr. Clutton, who for some time collaborated with the architect of St. Faith's, built St. Jude's, Bethnal Green (one of Bishop Blomfield's ten churches), with a nave planned very similarly to St. Faith's, though the structure taken *en masse* with its angle turrets, and apse arcaded just below the eaves, recalls those of the Rhenish provinces.

Should your correspondent be paying a visit to St. Faith's he should not leave unseen two other Stoke Newington churches no less remarkable. I allude to St. Matthias (from which St. Faith's sprang), situated in Goldsmith Square, near Newington Green; and St. Mary's, the parish church, close to Clissold Park, at the west end of Church Street.

St. Matthias, a specimen of Butterfield's Early Middle Pointed work in his more chastened method, is distinguished by its gabled tower rising at the east end of a nave 70 feet high by only 25 feet in breadth. The interior, albeit very severe, has a dignity and solemnity that has rarely been surpassed in modern church building; indeed, the whole structure bespeaks the noble sentiment which must have pervaded the minds of its architect and promoters.

St. Mary's, finished with the exception of the upper part of the tower and the spire in 1858 (five years later than St. Matthias), is a grand, and at the same time graceful, conception of Sir Gilbert Scott.

At that time, as many of your readers will remember, Sir Gilbert's work was greatly influenced by the study of northern continental Gothic. Accordingly we find in St. Mary's, with its western steeple, gabled aisles, shallow transepts, chancel ending in a five-sided apse, and tall cylindrical columns whose boldly yet gracefully carved capitals represent an infinite variety of flowers and foliage, a combination of the north-eastern French, Belgian and German schools. In many features it may be compared with the architect's almost contemporary churches of St. Paul, Dundee, and St. Andrew, Ashley Place, Westminster.

Reverting to the subject of Mr. Mackrell's letter, I may take the opportunity of saying that, of late years, no architect has solved the problem of designing an aisleless church more clearly and gracefully than Mr. Walter J. Tapper in his churches of St. Erconwald, Southend, and of the Ascension at Malvern Links.

With apologies for the length of this communication,—
Believe me, yours faithfully, T. FRANCIS BUMPUS
(Vicar's Warden, St. Matthias.)

Glebelands, Stoke Newington:
Septuagesima, 1906.

P.S.—In the obituary notices of John P. Seddon, which have appeared during the last week or so in the secular and ecclesiastical press, I find no mention of his delightful book "Rambles in the Rhine Provinces," originally published in 1868, and showing him to have been as clever with his pen as with his pencil. I take this opportunity, therefore, to remind your large and, I trust, ever-growing circle of readers of this valuable contribution to the ecclesiology of Northern Europe.

Minley Manor.

SIR,—My attention has been called to a note in a recent issue of your paper, accompanying a photograph of Minley Manor, the design of which you ascribe to the late George Devey. It is true that Mr. Devey carried out some very extensive alterations and additions at Minley, but it is quite erroneous to ascribe the building to him, since it was designed by Henry Clutton in a style foreign to Mr. Devey's taste. He naturally adapted the new work to the style of his predecessor as far as practicable, but there is no instance of similar design on his part where he was quite unhampered. In the portion illustrated by you Mr. Devey is responsible only for the octagonal tower (up to the parapet) and the porch. The roof and lantern to the tower, besides many other important and more recent additions, is the work of Mr. Arthur Castings, who was intimately associated with Mr. Devey during his life. No one welcomes more than myself any tribute that may be paid to Mr. Devey's memory, for the beauty of his work deserves a greater and wider recognition than it has ever yet received. But he died in 1886, and it is with increasing difficulty that we can trace his hand in such work as has been modified and altered since. I shall be obliged, therefore, if you will give publicity to this letter, which may tend to remove a wrong impression in the minds of your readers.—I am, sir, yours faithfully, WALTER H. GODFREY.

11 Carteret Street, Westminster:
February 8, 1906.

R.I.B.A. Fellowship.

SIR,—I am sorry that it should again be necessary to ask your assistance on this vexed question.

Is it not time that the Council settled the real function and purpose of the Fellowship? Is it (1) a means of providing money for the exchequer; or is it (2) a means of keeping in check the Associates; or is it (3) a means of recognising eminence in professional work?

The recent nomination and election of the group of really leading men might imply that (3) was the motive, and that the Institute wished to honour men of power and eminence; but many of us wish to know whether the secretary informed these gentlemen how the members of the profession have been begged and entreated to become Fellows (not, be it noted, Associates), and what a brilliant company of colleagues in the Fellowship have been and are being provided for them.

I should like to have an opportunity of expressing the widespread disgust and scorn with which the action of the R.I.B.A. is regarded by all whom I meet; and as showing that this is not a merely personal expression of opinion I may state that I hold letters from most of the leading provincial allied societies strongly endorsing the protest of the Leeds and Bradford Associates, which I was instructed to forward to you and to them.

If the Institute sees fit to flout the strongly-expressed protest of the allied societies in this way, and if the London men are content to be ignored, it will become necessary, and not for the first time, for the provinces to lead; and I think I can promise them an opportunity of voting by ballot on some of the nonentities who are rushing in to what was once thought to be the more honourable class of membership.

Digitized by Google

There are, of course, other methods still possible of bringing our views before the members of the Institute; and our members here feel so strongly on the matter that we intend to make the matter a test question in voting at the forthcoming Council election.

Leeds. FREDK. MUSTO, A.R.I.B.A.

Assumption of the Letters "F.S.A."

SIR,—In reply to a letter appearing in your issue of the 9th inst., under the heading of "Assumption of the Letters F.S.A.," and signed by Mr. St. John Hope, may I remind your correspondent that the Society of Antiquaries of London is not the only Society of the kind existing, and that I belong to the equally well-known Society, the Society of Antiquaries of Scotland, of which I was elected a Fellow in 1904, and therefore am entitled to use the letters "F.S.A." equally with Fellows of the Society of Antiquaries of London.—Yours faithfully, H. STEWARD WATLING.

Kingsway House, Dovercourt:
February 10, 1906.

Motors Affecting House Property.

SIR,—It is not generally realised, except by the sufferers, how much motor cars have depreciated the value of such house property as is situate on main roads leading to and from towns. On a dry, dusty day last summer I saw a large motor travelling at great speed on a main road. I was on a hill and could see the effect, which was to raise a cloud of dust half a mile long. In warm weather windows are kept open, and houses which are situate on main roads are therefore smothered in dust every day, to the detriment of their contents and discomfort and injury of their occupants. I have heard of houses on main roads having been vacated for this reason by the tenants, and the landlords, having been unable to relet them, have appealed for a reduction of rates in consequence. The houses now in demand are those which stand well back from main roads, being approached by a long carriage drive. Professor Thomas Oliver said in a lecture he gave at the Royal Institute of Public Health last October that the dust raised by motor-cars carried into the atmosphere germs of every description, which often remained in suspension for a considerable period, and that the consequences were prejudicial, not only to the individual, but to the climate of our country.—I am, &c., C. F. DOWSETT.

Winklebury, Basingstoke.

Holborn New Town Hall.

SIR,—The Holborn Council have decided to invite six architects to compete for the erection of their new town hall. Why not have let the work go to public competition? The tendency to ask some six favoured gentlemen to work a limited competition is too much on the increase; surely all public work should be thrown open to public competition, and so secure good work and give that stimulus to the profession which is so sadly required. The young architect is by that means given his opportunity, and has an equal chance with his older and more fortunate professional brethren?—I am, yours, &c., A.R.I.B.A.

GENERAL.

Mr. Jesse Horsfall, of Manchester, has been awarded the first premium of 30*l.* in the competition for a free library at Crompton, to be erected at a cost of 3,500*l.* A premium of 20*l.* has been awarded to Messrs. Dixon & Potter, Manchester; of 15*l.* to Mr. Thomas J. Hill, of Manchester; and of 10*l.* to Messrs. John Eaton, Sons & Cantrell, of Ashton. The adjudicator was Mr. G. H. Willoughby, of Manchester.

The Cardiff Public Works Committee are to take measures against the nuisance alleged to be caused by the increase in number and sizes of tradesmen's signs. The Corporation have power to interfere when the signs are an obstruction, annoyance or nuisance to the public.

The American Society of Civil Engineers at their annual meeting in New York appointed a sub-committee to report on a proposed amendment to the constitution, by which Art. II. Sect. 2 would read as follows:—"A member shall be a civil engineer who shall have reached a position of recognised standing in the profession in its several branches, including military, naval, mining, mechanical and electrical engineering, or in architecture or marine architecture. He shall be at the time of his admission to membership not less than thirty years of age."

The Flintshire Education Committee have decided in view of early legislation to defer the consideration of plans submitted by the managers of non-provided schools for the erection of new buildings.

The Annual Report of the Glasgow Archæological Society states, with regard to the rebuilding of Glasgow Royal Infirmary, that the managers seem determined to proceed with their scheme without modification, with the result that the huge "Jubilee Block," to front Cathedral Square, will destroy the appearance of the cathedral.

The Kent Archæological Society will visit Canterbury in June for their annual meeting and excursions.

The Council of the Royal College of Surgeons have agreed to contribute 10 guineas towards the rebuilding of the tower of Hempstead Church, Essex, where William Harvey, the discoverer of the circulation of blood, is buried.

An Oak Tablet recording the names of the deans and canons of Carlisle since the Reformation has been placed on the north wall of the fratry of the cathedral. It was designed by Mr. Martindale, architect. According to an inscription the tablet has been "made in 1905 from a roof beam of the old tithe barn, built circ. 1425." The first dean mentioned is Lancelot Salkeld, "Last prior 1541, deprived 1547, restored 1553, died 1560."

At the Last Meeting of Edinburgh Town Council the Lord Provost gave notice of a motion that "the Town Council resolve to offer a site or give substantial assistance to the building of an art school in Edinburgh, conditionally that an adequate grant is made by the Scottish Education Department from the suspense fund of the grant in aid, and remit to the Lord Provost's committee to confer with other public bodies interested to make the necessary arrangements regarding details and to make immediate application for a grant."

Mr. Francis Webb Wentworth-Sheilds, M.I.C.E., of Brentwood Sholing, Southampton, who died on January 18, left estate of the gross value of 2,382*l.*, with net personalty sworn at 2,363*l.*

Mr. James Lord, district sanitary inspector of Manchester, has been awarded the Chadwick gold medal for the best paper on "What Amendments to the Existing Public Health Acts are most Essential to Benefit the Community?" This subject was selected by the Chadwick Trustees, and Mr. Lord has secured the first gold medal offered by them, together with a cheque for 50*l.*

Mr. James Thomas Linnell, of Redhill, Surrey, landscape-painter, who died on November 26, left estate of the gross value of 54,736*l.* 14*s.* 7*d.*, including personalty of the net value of 45,114*l.* 10*s.* 11*d.*

Mr. Evan Spicer, vice-chairman of the Council, on behalf of the Society of British Sculptors, presented a petition to the London County Council on Tuesday, asking the Council to grant a temporary site and building where an exhibition of examples of the art of sculpture could be properly held. The petition was referred to the improvement committee.

An Exhibition illustrating the Georgian period will be held in the Whitechapel Art Gallery, London, during March and April. Views of the architecture of the period will be represented.

An Amalgamation of the Moffat Hospital Trust and the Nursing Association, Edinburgh, has been accomplished. Out of the money available a cottage hospital, which is nearly completed, has been erected in Selkirk Road from the designs of Mr. C. H. Maidman, Edinburgh.

The Norman Church of St. James, Dover, had a narrow escape from destruction by fire on Monday. This church contains the ancient Cinque Ports Court of Admiralty, where maritime cases concerning the Cinque Ports were heard down to the time of the Duke of Wellington's Lord Wardenship. The fire occurred from overheating.

The Foundation-stone of a new art school as an addition to the Wedgwood Institute, Burslem, was laid on the 9th inst. The tender of Messrs. W. Grant & Sons, amounting to 6,500*l.*, was accepted for the work. The designs have been prepared by Mr. A. R. Wood.

The Dublin Museum has obtained a very important example of early pewter, viz. one of the celebrated "Temperantia" salvers, by François Briot, a Swiss artist who worked in France in the latter part of the sixteenth century, and whose pieces were imitated by Gaspard Enderlein, a Nuremberg artist of the seventeenth century. It is richly ornamented with arabesques, and with panels containing figures in relief emblematic of the seasons, &c., and has on the back a medallion portrait of the artist. A fragment of the ewer which accompanied it was also obtained.

The Architect.

THE WEEK.

THE Portsmouth Town Council recently accepted the tender of R. H. B. NEAL, LTD., for the construction of sewage tanks at Eastney, the amount being 56,678*l.* The tender which came next was about 2,000*l.* higher. It was afterwards discovered that in pricing out the details one figure was omitted in a page. But that figure represented 1,000*l.* The contractors lost no time in informing the town clerk. He obtained the opinion of Mr. ELDON BANKES, K.C., on the subject, who informed him that the Council was liable for the amount. Some correspondence followed, and as a result Mr. BANKES came to the conclusion that Messrs. NEAL were entitled to the sum claimed and could recover it by an action. The amount has, however, been reduced to 900*l.* 15*s.* 5*d.*, and on Tuesday the drainage committee recommended that the contractors' claim should be settled by payment, and also the costs that had been incurred. This is not the first time in which the Town Council have had to pay for a similar claim, as 1,000*l.* became due through a contractor's error in the contract for the technical institute. In that case the advice of two counsel were sought. We think credit is due to the Council for so promptly deciding upon the claim. Cases have occurred where by refusing to recognise contractors' errors of arithmetic serious loss has been incurred. The Eastney contract was not one for a lump sum. But as it was based upon detailed quantities of an abundant kind, there was a possibility of overlooking items or of slips in addition. The Portsmouth Town Council have therefore set a good example of equitable conduct. In order to avoid claims for mistakes the town clerk is said to be preparing a draft contract which will remove liability from the Council. One of the members proposed "That in all future conditions of contract a clause be inserted therein indemnifying the Portsmouth Corporation from any claim arising from any error made by the contractors in estimating for work tendered for." The remedy suggested by another councillor was:—"That in all future contracts priced bills of quantities of the accepted contractor be prepared and checked, that a copy be retained by the town clerk before the contract is signed and the seal of the Corporation affixed."

AMONG the miscellaneous objects acquired by Lord ELGIN, in addition to the sculpture of the Parthenon, were two fragments from the Treasury at Mycenæ, which some archæologists believed to be the tomb of AGAMEMNON. One is a dull green stone, the other is a deep red or maroon. They were regarded as fragments of friezes. But it is now considered they were parts of the shafts of columns. Both are ornamented with scrollwork. Some time ago we mentioned that other fragments of an allied kind were discovered in Westport House, co. Mayo, belonging to the Marquis of SLIGO. He has generously presented them to the British Museum. It is now believed that when copies are obtained from one or two continental museums it will be possible to set up two almost complete columns which once flanked the entrance to the Treasury of ATREUS. Restorations of the doorway have been prepared by French archæologists, and representations of one will be found in MM. PERROT and CHIPIEZ's volume. The columns were 21 feet in height, and the thickness at one end is 9 inches and at the other 8 inches. But it is supposed that later practice was reversed and that the thicker part of the column was above instead of below. If the intentions are carried out the Archaic Room will have a new interest for architects.

FROM a decision given in the Acocks Green police court a few days ago it is evident that contractors must recognise not only trade rules in general, but local adaptations of them. As our lists of tenders demonstrate every week, distance is now no obstacle to the undertaking of a contract, and therefore one of the first duties of a contractor should be to make himself acquainted with the rules and regulations which local trade societies have established. A bricklayer who was employed by Messrs. HENRY LOVATT, LTD., on the erection of a new railway station, was dismissed by the foreman at an hour's notice. It was a rule of the Birmingham Operative Bricklayers' Society that an hour's notice, whatever time of the day it might be given, should be deemed to have been given an hour prior to the finish of the day's work, the object being that a workman should always be sure of a full day's wages. The claimant was paid for working until two o'clock. But he considered that he should have been paid up to five o'clock, and the claim was therefore for 2*s.* 4½*d.*, being three hours' wages at 9½*d.* an hour. The foreman was a stranger, and not aware of the Birmingham rules. And as he accepted an hour's notice from workmen, he thought he could dismiss them on the same terms. It was stated that the rules had been approved by representatives of the builders and the workmen. But counsel for the contractors said his clients were not bound by them in any way, and no contract had been made to accept them. The magistrate's decision was in favour of the claimant, and the case therefore serves as a warning to other contractors.

THE reports which Dr. THRESH, the medical officer for Essex, prepares are always worth attention, for he is never afraid to express the conclusions he has derived from skilled observation. In advocating the building of cottages by the Chelmsford Rural District Council he says:—"If I were asked whether I would rather see 1,000*l.* per annum spent in maintaining an isolation hospital or in providing 200 cottages for labourers, a few of which could be retained for hospital purposes, I should most emphatically recommend the provision of the cottages, as I now believe that we could far better cope with infection in this way than by means of hospitals. I shall have to point out later that hospitals have but little effect in preventing the spread of infection. The third bedroom in the cottages would very often suffice for isolation, and the patient would in many cases be better there than herded with a large number of other cases in the ward of a hospital." Hospital physicians are not likely to approve of Dr. THRESH'S theory, but his words should be considered by landed proprietors, for defective cottages are agents in the fostering and spreading of disease.

A CURIOUS case for the recovery of fees was heard last week in Dublin. Mr. HIGGINBOTHAM, an architect, claimed 131*l.* from Mr. BOYD as payment for professional services rendered. From the evidence it appeared that the plaintiff, the defendant and another gentleman in 1902 entered into a partnership for the purpose of leasing land at a place called Sutton, a few miles from Dublin. The lease was taken out by Mr. BOYD, as trustee for the partners, and the arrangement was that Mr. HIGGINBOTHAM was to capitalise a building fund by bringing in 100*l.*, and sinking in the partnership his fees as architect. It was remarkable, however, that no money was expended by any of the parties. The defendant entered into private speculations outside the partnership, and such profits as he made he kept to himself. Mr. HIGGINBOTHAM did certain work for Mr. BOYD, and he sought to make him personally liable for his fees, as separate and independent lessee, and as employing him. For the defendant it was maintained that he never asked the plaintiff to do any work or expend any money, save in accordance with the terms of the partnership agreement, and on behalf of the partners. The partnership had never been dissolved nor had the accounts been settled between the partners. The jury came to the conclusion that plaintiff was entitled to 31*l.* 12*s.* 6*d.*

JOHN EVELYN.

ON Tuesday next two centuries will have elapsed since JOHN EVELYN departed this life in his eighty-sixth year. Already articles have appeared in various journals concerning him. He deserves to be remembered as a patriotic Englishman and as a model of a good citizen. But he also is worthy of recognition as an amateur who was not content with the collection of ancient examples of art. HORACE WALPOLE includes him among the artists, for, as he said:—"If Mr. EVELYN had not been an artist himself, as I think I can prove, I should yet have found it difficult to deny myself the pleasure of allotting him a place among the arts he loved, promoted, patronised; and it would be but justice to inscribe his name with due panegyric in these records, as I have once or twice taken the liberty to criticise him, and it may be remarked that the worst I have said of him is, that he knew more than he always communicated." EVELYN's life was said to be a course of inquiry, study, curiosity, instruction and benevolence. Among the services which he rendered, according to WALPOLE, were obtaining the Arundelian marbles for the University of Oxford and the Arundelian Library for the Royal Society. WALPOLE believes that he etched five plates of subjects he saw in journeying between Rome and Naples. He also wrote a book on the engraver's art.

His services to architecture were much more important. At a time when precedents were needed he translated from the French FRÉART's "Parallel of Architecture, both Ancient and Modern," a book in which examples of the orders in Roman buildings are compared with later examples by Italians and Frenchmen of the Renaissance period. EVELYN supplemented the translation by a glossary. The work was useful as supplying genuine examples of columns to the builders of 1664. At a later time ADDISON had the courage to notice the translation in the *Spectator*, and in that way an interest in architecture must have been created among the fine ladies and gentlemen of the Queen ANNE period. EVELYN was a far greater man than he appears from his books. He was recognised as an authority by the Court and high officials. And his influence, as we shall see, was exercised on behalf of architecture especially.

By birth he was an English gentleman belonging to a family that had settled in Surrey. His grandfather in 1587 obtained a patent for making saltpetre, and carried on the manufacture of gunpowder at Long Ditton and at Godstone. JOHN EVELYN was born at Wotton in 1620. He is said to have received his first education in a school which was held in a room over the porch of the parish church. Afterwards he was sent to a free school at Southover, Lewes. He went to college, and subsequently was entered as a law student in the Middle Temple. England at the time was becoming a sea of troubles. He was present on Tower Hill and witnessed the stroke which severed the wisest head in England from the shoulders of the Earl of STRAFFORD. That was in May 1641. In the following month he had his portrait painted in oils as a present to his sister, for he had resolved, as he said, "to absent myself from this ill face of things at home, which gave umbrage to wiser than myselfe, that the medaill was reversing, and our calamities were but yet in their infancy." He first went to Holland, and at The Hague visited the Queen of BOHEMIA, the daughter of JAMES I., with whose sufferings, which were the result of an unfortunate ambition, many English gentlemen sympathised. At Rotterdam he was present at the fair at which paintings were sold, and he could not resist buying some. He remained abroad until October. In the following May he obtained from CHARLES I. a license to travel again. It seemed to be unworthy of a young Cavalier to leave CHARLES at a time when he was in straits. But EVELYN may have served the royal cause while abroad. He was everywhere received as if he were an official of some importance. After the fall of the Monarchy he lived in France and Italy. His time was occupied in visiting buildings and collections of paintings. He acquired a knowledge which in extent was beyond that of the ordinary amateur. On February 6, 1652, he landed at Dover. A month afterwards he witnessed the "magnificent funeral of the arch-rebel IRETON." He resolved to live quietly on his estate at Deptford. He was encouraged, he says, by the exiled CHARLES II. to do so, and he adds the significant remark:—"I had also addresses and cyfers to correspond with His Majesty and Ministers abroad, upon all which inducements I was persuaded to settle henceforth in England, having now run about the world, most part out of my owne country, neere 10 yeares." EVELYN as a royal agent is a subject which has not yet received sufficient attention.

He was disposed naturally to magnify any inconvenience he might have to endure under the Commonwealth. But it must be allowed that he enjoyed the fullest liberty. He purchased Sayes Court, in Kent, where he was afterwards to have PETER THE GREAT as a tenant. He was constantly travelling about the country, apparently for the purpose of studying architecture and examining buildings and gardens. It is not improbable his real object was to uphold the royal cause. In his Diary he records his impressions. During his visit to Oxford he saw the strange things which Dr. WILKINS of Wadham College had devised; among others a hollow statue which, by the aid of a concealed pipe carried up to its mouth, uttered words. He tells us that WILKINS had "in his lodgings and gallery variety of shadows, dyals, perspectives and many other artificial, mathematical and magical curiosities, a way-wiser, a thermometer, a monstrous magnet, conic and other sections, a ballance on a demi-circle, most of them of his owne and that prodigious young scholar, Mr. CHRISTOPHER WREN, who presented me with a piece of white marble which he had stain'd with a lively red very deepe, as beautiful as if it had been natural." He also visited Stonehenge, where he counted *ninety-five* large stones. He tried to break off a fragment with a hammer, but owing to its strength he failed. Although apparently only a lover of architecture as an amateur, EVELYN's practicality could not be altogether concealed. At the end of 1658 he tells us he was summoned to London by the Commissioners of New Buildings and afterwards by the Commissioners of Sewers. But he declined to take an oath of fidelity to a government that was without a king, and he was excused. Soon afterwards he was again summoned to London by "the Commissioners for new foundations to be erected within a distance of London."

In 1660 CHARLES II. was restored, and from the time of the proclamation EVELYN assumed a position which could only have been gained by rendering important services. It was desired that he should be among those who went to Breda to invite the king, but he was too ill to make the voyage, and received a gracious message of sympathy from His Majesty. CHARLES greeted him on landing as if he were an old friend, and he seems to have had much to do with the distribution of offices. He was not neglectful of art or science. Prince RUPERT, with his own hands, he tells us, explained the process of mezzotint, of which EVELYN published a description in his "History of Chalcography":—"This set so many artistes on worke, that they soone ariv'd to that perfection it is since come, emulating the tenderest miniatures." There was a race on the Thames from Greenwich to Gravesend and back between a yacht which the Dutch East India Company had presented to CHARLES and another belonging to the Duke of YORK, the wager being 100*l*. Four noblemen and EVELYN accompanied the king. EVELYN had just published his "Fumifugium." While sailing the king, we are told, "was pleas'd to discourse to me about my book inveighing against the nuisance of the smoke of London, and proposing expedients how by removing those particulars

Digitized by Google

I mentioned, it might be reform'd; commanding me to prepare a Bill against the next Session of Parliament, being as he said. resolv'd to have something don in it." The queen's attorney prepared a draft of the Bill in which it was proposed to remove the various trades which caused the smoke and endangered the health of the king and his people. Nearly two centuries, and a half have elapsed since that promise was made. But the smoke nuisance may still be said to defy all attacks upon it.

In May 1662 EVELYN was appointed one of the Commissioners for reforming the buildings and streets of the City of London. His first duty was to examine St. Martin's Lane, although not in the City, in order to discover if it could not be made more passable into the Strand. Another reform was the paving of the way from St. James's North, which was then a quagmire, and the Haymarket about Piqudillo (Piccadilly).

Works of that kind were soon, however, to be disregarded in comparison with the great undertakings which were caused by accident. WREN was appointed to be one of the three surveyors for the repair of Old St. Paul's, or, if necessary, the erection of a new building. On their first examination they found the wall of the building receding outwards. "Mr. PRAT" said it had been so built originally for perspective effect with regard to height. But EVELYN and WREN were of a different opinion. And the two suggested that a noble cupola, a form of church building unknown in England, but of wonderful grace, should supersede the ancient and lofty steeple. Within a week of the consultation the Great Fire broke out. After recording his impressions of what he saw EVELYN exclaims:—"GOD grant mine eyes may never behold the like, who now saw above 10,000 houses all in one flame; the noise and cracking and thunder of the impetuous flames, the shrieking of women and children, the hurry of people, the fall of towers, houses and churches, was like an hideous storme, and the aire all about so hot and inflam'd that at the last one was not able to approach it, so that they were forc'd to stand still and let the flames burn on, which they did for neere two miles in length and one in bredth. The clouds also of smoke were dismall and reach'd upon computation neer 56 miles in length." EVELYN prepared a survey of the ruins and a plan for a new city within a couple of days after the fire. It was examined by the king, the queen and the Duke of YORK, and they appeared to be pleased with his suggestions. But it was not EVELYN's plan which was accepted but a rival one by CHRISTOPHER WREN, and the latter was only partially carried out. Among EVELYN's suggestions was the employment of the rubbish to form an embankment alongside the Thames. He must have been disappointed, but we have no expression of opinion from EVELYN on the subject. He says very little concerning the erection of St. Paul's. But he notes that WREN faithfully promised him to employ GRINLING GIBBONS. The sculptor was discovered by mere accident in a poor, solitary thatched house near Sayes Court. EVELYN found him carving a crucifix after TINTORET. GIBBONS was introduced to the king, and it was expected that the queen would have bought the crucifix. But an ignorant French woman who was present found so many faults in it, the equally ignorant queen became afraid to exhibit a want of taste, and the work was returned. CHARLES also consulted EVELYN about the building of a palace at Whitehall, as if designs had not been prepared by INIGO JONES. But, like many more of CHARLES's projects, no builders were employed on it.

From the glimpses which we can obtain by means of the Diary it is evident that use was made of EVELYN on a great many occasions. Although it was an age when Sir JOHN DENHAM, a poet, had charge of the public works, we are unable to discover that EVELYN was appointed to an office from which there were substantial emoluments to be derived. He was most loyal to the king, and hated the Commonwealth and all governments which were carried on without an anointed head, but it is not unlikely that the flippant courtiers who surrounded CHARLES represented EVELYN as at heart a Puritan and a censor. A man of that kind would not be acceptable to CHARLES II., although he might be used whenever occasion demanded. EVELYN lived through the reigns of JAMES II. and WILLIAM III. ANNE was queen when he resigned his office of treasurer of Greenwich Hospital to his son-in-law. He witnessed the celebration of the Battle of Blenheim, and MARLBOROUGH a little later spoke to him with extraordinary familiarity and civility. After he had passed his eighty-fifth year he made up his accounts with his usual regularity, and until the end acted as became a man who had throughout his long life endeavoured to discharge his duty faithfully.

EVELYN was a type of those remarkable seventeenth-century scholars who might be said to have accumulated knowledge by a scientific process. His manner of study has been recorded. First having chosen his subject he divided it into various parts, each of which was to be taken up when opportunity offered. Under each he set down his own thoughts as they occurred, or those of other writers which he had met with. Then lawyer-like he looked up precedents relating to the subject. When sufficient information was supposed to be acquired he began abbreviation, and hence it was that the volumes which he published seemed to be no more than the quintessence of his commonplace books. This manner of proceeding justifies what WALPOLE said about EVELYN's knowing more than he communicated.

THE CASTLE OF SAINT ANGELO.

THE adaptation of the Mole of Hadrian, which in later times was known as the Castle of Saint Angelo in Rome, into a museum which will be representative of both civil and military engineering, illustrates in a remarkable way the vicissitudes to which ancient buildings appear to be liable. The building has been a mausoleum, a fortification, a Papal retreat, a prison. Its new purpose will not be foreign to its history, for it will exemplify models and representations of Italian warfare. It will also convey the lesson that science can have its victories as well as war.

The Emperor HADRIAN, who was, it is believed, the creator, was born in Rome in A.D. 76. Being a cousin of TRAJAN he was at an early age entrusted with military commands. Endowed with physical vigour he was indifferent to the atmospheric conditions of the vast Empire, and could endure the cold of Scotland and the heat of Egypt without the least inconvenience. He is supposed to have visited every province ruled by Rome. The chronology of his voyages is suggested by the medals which were struck on his arrival, and which prove his presence in Campania, Gaul, Germany, &c. The Wall of Hadrian, which extended from the Solway to the Tyne, is a memorial of his residence among us, for although there are disputes about his claim to have constructed over seventy continuous miles of fortification, there is little doubt that the greater part can be credited to him. Although less ostentatious than many other emperors, he took care to have a technical corps attached to him in his journeys. Indeed, he gave so much attention to the art of building that his reputation has suffered because he anticipated DISRAELI, and if he did not "hang an architect" as a matter of policy it is believed he had one executed in another way. HADRIAN had decided to erect a great temple in honour of Venus and Rome. The plans, of which the emperor approved, were sent to APOLLODORUS, the Greek architect. He remarked that the building appeared small if compared with the size of the statues to be placed therein, and it was impossible for them to stand upright or to walk out. So frank a criticism on the emperor's judgment was rewarded by exile and death.

Digitized by Google

The accounts of the architectural and engineering works of HADRIAN now seem to be incredible on account of their number. A district of Athens became known as Hadrianopolis, in recognition of the great undertakings he had carried out in the city. He created a new Jerusalem on the ruins of the old. In Italy and Rome he surpassed all his predecessors in promoting public works. It is to HADRIAN that the world is also indebted for a type of sculpture which, if novel, cannot be admired without hesitation. We refer to the beautiful, if unhealthy, representations of his favourite ANTINOUS, in which the Hellenic type is abandoned. The face does not correspond with the Greek ideal. It is of a coarser nature. But the emperor was fascinated with the beauty, such as it was, and the young Bithynian became his companion, if not his councillor. Those who sought the favour of the confidant made out that APOLLO was inspiring him, and for a time after his death he was honoured as a prophet. There is a legend that he killed himself, and all the resemblances suggest a despairing mind. HADRIAN made him an object of religious worship, and strange to say it continued for some centuries, for there are many protests of the Christian fathers against the demoralisation of such a cult. Amidst the ruins of the emperor's villa many statues of ANTINOUS were found. And it is believed there are about thirty in continental museums. To WINCKELMANN some of them were the glory and the crown of sculpture. The large head known as the Mandragone he considers as the third noblest example of ancient art.

It is not known when the Mole of HADRIAN was commenced. The earliest reference to it merely states that the emperor constructed a sepulchre in Rome near the Tiber. The body of the emperor, it would appear, was first buried in a tomb close to the villa of CICERO, in Puteoli. Afterwards it was transported to Rome and placed in the gardens of DOMITIA, NERO's aunt. Finally it was interred in his mausoleum. The meaning of this probably is that the structure was not finished when HADRIAN died, and temporary resting-places had to be employed until the Mole was completed by his successor, ANTONINUS PIUS. Afterwards the ashes of the ANTONINES were deposited there.

The earliest account of the structure is given by PROCOPIUS, a man who, from being professor of rhetoric in Byzantium, became one of the greatest statesmen of his time, and was one of JUSTINIAN's ministers. As secretary to BELISARIUS, the general, he took part in the wars of the Goths against Rome, and he has written an invaluable account of the events he witnessed. In describing one of the attacks on the Aurelian Gate, PROCOPIUS says:—"The tomb of the Emperor HADRIAN is situated outside the Aurelian Gate, about a stone's cast distant from the bulwarks of the city. It is an object worthy of our consideration. It is built of Parian marble, and the blocks fit close to one another without anything between to bind them. It has four equal sides about a stone's throw in length; its altitude rises above the city walls; on the top are statues of the same kind of marble, admirable figures of men and horses. The men of old time (because it appeared advantageous for the defence of the city) joined it with the bulwarks by two walls, thus making it a part of the fortifications, so that it had the appearance of a lofty tower covering the gate."

The Mole in the sixth century must have differed in its external appearance from the Papal castle of later years. It evidently was square on plan and not circular. No doubt many alterations have since been made. PROCOPIUS subsequently records that the beautiful marble statues were torn from their pedestals and were hurled against the Goths. The "Barberini Faun" is supposed to have been one of those missiles. It was long believed that the columns were used in the basilica of St. Paul's without the Walls. Although they might not appear out of place in marking the storeys of an interior, they would be too small to serve as piers on the exterior of so massive a structure. Unfortunately the columns are not discoverable, and we can only speculate about their dimensions. In the thirteenth century a writer in describing the Mole said it was faced with marble, and there were figures of gilded peacocks, a bull and horses, besides bronze doors. According to another ancient writer, the structure was surmounted by a figure of HADRIAN, who stood on a triumphal car drawn by four horses. There is no doubt the latter writer, who came from Antioch, must have written from imagination. He says that the eyes of the horses were so large a full-grown man could pass through one of them. In the fifteenth century the Mole was represented on a bronze door for St. Peter's, by ANTONIO POLLAJUOLI. In a drawing made by CAMUCCI in the sixteenth century a part of the cornice was indicated which was adorned with ox-heads and festoons, elements of decoration which were familiar to Roman sculptors.

From the description given by PROCOPIUS we may assume that the Mole was in his time recognised as a fortress. With a succession of enemies who were fierce barbarians the Romans were not likely to think only of the preservation of the shrine of a tomb containing the dust of a family of their emperors. It is remarkable that before the sixth century closed a chapel was erected on the top of the fortress by Pope GREGORY, who by force of character and eloquence had subdued the barbarians to some extent and was allowed to interfere with the arrangements of the building. It is said that while he was praying in a procession for the extinction of a plague he saw the figure of St. MICHAEL above the Mole of HADRIAN sheathing his sword, and the chapel was the memorial of the event. It does not appear that the name Saint Angelo was given to it at that time. The building, in fact, bore a variety of names according to the respective owners. In the tenth century it was called the "Castello di Crescenzio," and in the eleventh century the house of THEODORIC. DANTE appears to have seen it in the Jubilee year, 1300, when crowds passed over HADRIAN's bridge in front of it on their way to St. Peter's.

The building passed through many vicissitudes, and it did not become a Papal possession until the twelfth century. After about thirty years it was seized by a consul, and from time to time it was handed over to the POPE and then retaken by some of the rebellious chiefs. RIENZI may be said to have commenced his revolution with a procession from Saint Angelo to the Capitol. After a defeat he retired to the building, and he might have remained in it with safety if he had not escaped to seek foreign aid. In the fourteenth century the French Cardinals somehow claimed it as an appanage. In the course of the changes of ownership the building decayed because nobody could anticipate how long it would be in their keeping. ALEXANDER VI. in the sixteenth century expended a large sum upon it, especially in the construction of a gallery between the castle and the Vatican. Under CLEMENT VII. the castle was besieged. German troops had made their way to Rome, and their leader was resolved to hang the POPE, who took refuge in the fortress, considering it to be the safest dwelling in Rome. CHARLES DE BOURBON was also the enemy of CLEMENT and endeavoured to seize him. It was in one of the attacks on the castle that BENVENUTO CELLINI, who was among the defenders, said he took a deliberate aim with his arquebuse at a person who seemed to be above the rest of the besiegers, and afterwards was surprised to find he had slain the Constable. In revenge Rome was made to suffer as terribly as in any of the wars of the barbarians. The Bourbon attack was taken as a lesson by subsequent Popes. URBAN VIII. in the seventeenth century constructed great outworks, and removed the bronze which lined the dome of the Pantheon in order to cast cannon to defend them. BERNINI, the sculptor, was his architect and military engineer.

Digitized by Google

BYRON accepted a belief which was common that HADRIAN in his construction was endeavouring to rival the Pyramids :—

> Turn to the Mole which Hadrian rear'd on high,
> Imperial mimic of old Egypt's piles,
> Colossal copyist of deformity,
> Whose travell'd phantasy from the far Nile's
> Enormous model, doom'd the artist's toils
> To build for giants, and for his vain earth,
> His shrunken ashes, raise this dome! How smiles
> The gazer's eye with philosophic mirth,
> To view the huge design which sprung from such a birth!

If in imagination we remove the parts added to strengthen the structure, we cannot accept the belief that there was anything Egyptian in style about it originally. AUGUSTUS may have had some such intention as is ascribed to HADRIAN, for, although his mausoleum was no more than 220 feet in diameter, he contemplated that both within and without the remains of his adherents should find a place. HADRIAN, on the contrary, was only desirous that members of the ANTONINE family could claim the right of burial in his tomb. The idea may have been derived from Egypt of having two remote sepulchral chambers which were approached by spiral passages. The Mole did not display any extraordinary ambition in the emperor, and whoever served as the designer did not adopt any novelty in architecture. A circular tower standing on a square basement, and it may be having a dome for a roof, surmounted by the bronze pineapple now in the Vatican garden, was not remarkable. What was inexplicable was the immense strength of the walls which were to serve for the sepulchral chambers in the basement, with their "two handfuls of white dust." It is remarkable that the coins only show HADRIAN's funeral pile and not the mausoleum.

The Castle of Saint Angelo has served as a prison. It is therefore no degradation to convert it into a museum. Italy was the first country in which fortification by bastions was employed, and there is no doubt that provision for defence had an effect upon the domestic architecture. An extreme instance is the Caprarola Villa. Drawings and models of fortifications which will be found in the new museum will make it unique. The castle itself will also, when seen under new conditions, be an attraction and will be suggestive of human progress.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Mr. Leonard Stokes, vice-president, in the chair.

Mr. E. GUY DAWBER read a paper, illustrated by lantern views, entitled

Furniture.

Tracing the development of furniture in England, the author said that nearly all the examples shown in MS. illustrations down to the middle of the sixteenth century were of an ecclesiastical character. Throughout each successive period the style of the furniture had followed that of the architecture, and if any special piece was required, the same craftsman who built the church, monastery or castle, made it, or at any rate had such control that in character and detail it assimilated with the building. Household furniture in the sixteenth and seventeenth centuries was characterised by simplicity and stability of construction, and, as much of it had to be shifted from one castle to another when any great personage moved, its supply was necessarily limited, and the rooms were consequently sparingly furnished. The influx of foreign workmen from Italy and the Netherlands had hindered the development of a distinctive and national taste, and up to the close of the sixteenth century there was hardly a definite and decided tradition. After the design of furniture began to break through its ecclesiastical environment, when the Renaissance in Italy had developed in England, then we find a real national style gradually being evolved. Perhaps the most constructively perfect period of English furniture was the end of the sixteenth and first half of the seventeenth centuries, and though its design was based almost entirely on classical influences and detail, and the outlines may suggest extraneous origin, it retained a character essentially English, and soon lost any trace of foreign influence. The workmanship was of the best, the construction admirable and framed in a manner calculated to withstand the roughest usage. During the reign of Charles I., and for many years previous, velvets, brocades, satins and stuffs had been imported from Venice and abroad, and much furniture from Italy as well as the Netherlands. The Restoration in 1660 caused a further influx of furniture and workmen from Holland, Flanders, Spain and France, and to this we owe a great deal of the mixed character and diversity of style so prevalent in the latter half of the seventeenth century.

Marquetry was one of the distinguishing characteristics of late Dutch seventeenth-century furniture, and when treated in a quiet and simple manner was very pleasing; but although it became the fashion for some years in this country, and chairs, cabinets, clock cases and indeed all surfaces offered opportunities for the new style of decoration, it never took a firm root, and after a few years died out. Carving, at the beginning of the eighteenth century, was sparingly used, the tendency being towards greater lightness and grace of line in furniture. In the eighteenth century many schools of craftsmen and cabinet-makers based their designs almost exclusively on the models of the leading architects of the day. Sir Christopher Wren had gathered around him a school of designers and carvers whose influence upon furniture-makers was very marked. It was the age of constructive joinery and beautiful carving, and whether in oak or deal one single style and tradition permeated the whole country. The architect was the chief director in all matters of style, proportion and arrangement, and a great deal of the actual furniture was designed by him. It is not too much to claim that the Classic spirit, so predominant throughout the furniture of the eighteenth century, is mainly attributable to the influence of architects. Chippendale's first book was published in 1754. In reading it we cannot held admiring the power he possessed of combining the seeming incongruities of the so-called French, Gothic and Chinese styles which were then so fashionable, and in making out of them pleasing and harmonious pieces of furniture, and imparting to them such symmetry and dignity. We see in his work how all his effect was obtained from outline and carving only, for though inlay, veneer and painting had long been in use, he discarded them altogether and worked in the solid mahogany. But he did not originate a style; he only carried on the existing traditions of the day and clothed them in fresh detail of his own, or borrowed from other sources. Whatever we may think of the general design of Chippendale and his fellow-workers, there is no doubt that these famous cabinet-makers thoroughly appreciated the proper limits within which carving, as applied to furniture, should be confined. Lowness of relief, adaptation to the structural lines, the employment of a maximum of plain surface with a minimum of carving, are all strongly marked characteristics of the work of this period. The author went on to deal with the work and influence of other eminent furniture designers—Shearer, Heppelwhite, the brothers Adam, Sheraton, &c. Two facts, he said, mainly contribute to the charm and interest of the furniture of bygone days: the first, that its form and detail were so admirably adapted to the material it was made of; the second, that it was always so singularly suitable to its environment.

Towards the close of the eighteenth century, though the design of furniture was still influenced by the architectural features and character of the houses it adorned, it began to show that the necessity for the two being absolutely in harmony was not considered essential, for a great school of specialists in furniture making had arisen, and the association between the architect and cabinet-maker was beginning to weaken, until it ceased to exist. About half a century ago, when perhaps domestic architecture in England was at its lowest ebb, things reached such a pass that the fashion in furniture became absolutely regardless of architectural principles or fitness, and only the idea of comfort and luxury prevailed until the inevitable reaction set in, and people, finding they could no longer get new furniture which was not an eyesore, reverted to the opposite extreme, viz. the older styles of former days. Then came the difficulty which still exists—which particular style amongst those of the past to select. All, perhaps, are equally incongruous in modern houses, yet all appeal to

Digitized by Google

people in different ways; and now that in the mind of the general public architecture and furniture have been definitely divorced from one another, it is the fashion to pick up pieces of furniture, quite indiscriminately, because they happen to be beautiful, quaint, or old, and people fill their houses, utterly indifferent to the effect produced. All this brings us back to one thing worth noticing—that throughout the periods when architecture flourished and was a living art, furniture was the same, and very beautiful work was the result; but when there ceased to be any real tradition in architecture, at the same moment furniture died out. The two are inseparable—they always have been and always will be; and just as to-day we have a real living common-sense style of domestic architecture, so also, with its development, will a real style of furniture arise. There is, undoubtedly, a great effort being made at the present time amongst many of our ablest designers and craftsmen to remedy this by producing designs for furniture original and artistic in treatment. There is still, however, too much inclination, in aiming at simplicity of form, to neglect the beauties of form altogether. Because mouldings have been excessively or wrongfully employed, there is a tendency to abjure them altogether, so losing one of the main factors in creating beauty and interest. Of course, to class the whole of the modern furniture produced to-day in such a category would be absurd, for we have designers and craftsmen who, if only given the opportunity, can design and make furniture which can rival the productions of past ages. But until there is some settled standard of thought and tradition permeating the whole country, any efforts at design in furniture must be but isolated and individual. The author said he did not suggest that an architect should design furniture; but he should have in his mind the house he is building, finished and furnished complete, just as a painter has a mental impression of the last state of a picture he may only be beginning to put on canvas. That impression may be modified and improved in detail as the work proceeds, but the general scheme, the broad idea, will remain. For the architect, however, who is more thorough in his work and is not content with constructing the mere shell of his house, there is much scope for excellent effects by planning permanent fitments, such as bookcases, cupboards, side-board recesses and so on. The reproach that the British is an inartistic nation is being removed. People have either become artistic themselves or have attained to the wisdom of Socrates in admitting that they know nothing and are content to leave the work to those whose business in life it is to show them what is artistically right and in good taste. With the improvement in domestic architecture which is so marked, the author felt sure that it would only be a matter of time before the public realised that good, sensible, modern furniture could be equally well obtained at a reasonable cost; and this result would be greatly helped if architects generally gave more thought and care than they do at present to the finishings and furniture of the houses they design. An architect's training and sense of proportion should enable him to exercise a very helpful power in controlling and directing the taste of the public.

Mr. PERCY MACQUOID, in moving a vote of thanks to the author, said it was difficult to add anything fresh to the very admirable paper they had just heard. The large subject had been treated in a simple way, and yet the paper had condensed into a small compass the knowledge of all the types that were practically known in English furniture. It was extremely difficult to give, as Mr. Dawber had done, the idea of how one period merged into another, but they had seen by the illustrations that those links were perceptible. It was the study of the different ideas during the periods of transition that taught most about the history of furniture. He would have liked to have seen more examples of the Elizabethan period, but they were not easily obtained. The great cupboard, which comprised nearly every necessity of the family, was only once represented. The authenticity of many existing examples was doubtful, and the speaker said he had proved many of them to be imitations of old work. One of the most beautiful specimens in oak furniture that had been shown to them was the Charterhouse table. It was especially interesting because it showed the very strong influence of French style, and because there was no other specimen in England which represented that particular phase so well. The paper seemed to have overlooked the use of walnut. It had been employed very extensively, and some specimens were made between 1770 and the beginning of the Peninsular War. Its beauty made such an impression at the time upon the people that walnut trees were planted in anticipation of future use. The wood must have been considered rather precious, because no trace could be found of its employment in Elizabethan times. He agreed entirely with what Mr. Dawber had said about Chippendale. He was an able man who did very little that was really original except the refinement and making of lighter furniture in forms that had previously existed. Chippendale made his furniture more practicable and in better keeping with the customs of the people of his own time. Before this date the furniture was clumsy, but Chippendale, who belonged to a far gayer and brighter period, introduced that spirit into his work. Mr. Dawber had shown how delightful the Adam furniture was, and as a completion to houses of the same design Adam achieved the most beautiful effects. The examples of modern furniture were interesting, and if the public would pay as much for such articles as their ancestors did satisfactory work could be produced. There was a tendency to have the wood rather flat and the mouldings also, and altogether there was a sense of affectation of bareness which was not attractive.

Mr. J. D. CRACE, who seconded the motion, said he felt interested in saying something about the paper, because it was just forty-nine years ago that his father had given a lecture on the same subject in that room, and he himself had prepared the diagrams which illustrated it. Mr. Dawber touched upon any interesting points which could be elaborated. There were one or two details which might be called to mind. He thought the paper made light of the importance of the aid which old manuscripts offered in the study of furniture. In those old illuminated documents domestic interiors were often represented, and the details gave clues to the customs of the day. Then there were very interesting specimens of furniture scattered about the country in old houses of even pre-Elizabethan times. There was a great amount of interesting furniture at Hardwick Hall. Elizabethan furniture was often extensively inlaid, and in the latter part of the paper mention was made of inlay on the round in the time of the Brothers Adam. Inlay on the round existed at Hardwick in the period of Elizabeth, and was probably introduced there in anticipation of the Queen's visit to the Hall. Knowle House was interesting, containing specimens belonging to the period of the Georges, that had evolved styles of furniture which had been sought out during the last decade. Mr. Dawber went far when he said that design had given out in the middle of the last century. It began to revive before the Great Exhibition, which was the outcome of a desire to make beauty in the articles of domestic life better understood. There was good work from 1850 up to the end of the century. A great deal of the furniture made might not have been high in quality, but the forms used had the right intention, for they showed the proper notion of what design should be. Architects could not do better than take a keen interest in furniture whether they made designs for such articles or not, because furniture must be included in the accessories of the houses they designed.

Mr. MAURICE B. ADAMS said there was one period in the history of furniture which had not been alluded to in the paper and which had always struck him as extremely interesting. He referred to the time when Burges, Street, Eastlake and Blomfield were designing furniture, some of which was valuable and merited recognition. In Burges's house at Kensington, which should be secured as a national monument, and also in his office at Buckingham Street, the furniture carried out the principles of the Gothic revival. The idea which William Morris, Rossetti and Burne-Jones realised was also familiar to Burges, namely, that perfectly plain furniture could be painted and made a work of art. Burges in his house gave beautiful representations of plant life, and carried furniture to a far higher standard than the work they had seen that evening by Chippendale and others. The main object was to produce that which would be beautiful and serviceable, but whether or not it was desirable to paint chairs on which people sat and which were liable to wear was another matter. The speaker thought, however, that a history of furniture which embraced all forms and styles down to the present day would be incomplete if they omitted such work as that which belonged to the period of the Gothic revival.

Mr. ARTHUR PENTY said it appeared to him that in early furniture very little of the work was entirely satisfactory. Though it was vigorous it lacked refinement, and in later work there was refinement but no vigour.

Mr. H. D. SEARLES WOOD and Miss E. ROWE also spoke.

The CHAIRMAN, in concluding the proceedings, announced

Digitized by Google

that the special meeting, which was to have been held on February 20, would be postponed owing to the indisposition of the President, and the need for some alteration in the form of resolution that it was proposed to bring forward regarding the purchase of the site between Nos. 11 and 13 Portland Place for the erection of new premises.

THE STUDY OF SCULPTURE.

IN his address at the Royal Academy on Monday Mr. W. R. Colton, A.R.A., said that winning a gold medal had been known to stop an artist's work, and so far as the little honours were concerned the student should pray for failure rather than success. If he spent six months over a statue and it was rejected at the Academy or the Salon he should set to work again, for two years if necessary, and work with enthusiasm. That, said the lecturer (according to the *Morning Post*), brought him to the keynote of his address, for the difficulties of sculpture were so great that without enthusiasm there could be little hope of success. Without enthusiasm the work was drudgery; with it the task was made pleasant that otherwise would be tedious and intolerable. It had been said that sculpture had advanced with leaps and bounds in England during the last thirty years, but whether that was so or not we ought to keep our shoulders to the wheel and study enthusiastically, for we were still many years behind one nation on the Continent, and the race between the nations should not be lost sight of. It was asserted that there was not much demand for ideal sculpture, but probably if more were produced a greater demand would arise. Even now the demand seemed to be increasing for small works—*objets d'art*—the taste for which should lead to a fuller appreciation of the finer forms of sculpture. There was no need for the sculptor to attach importance to supposed classic scales and rules. The race of men who thought too much of these things had disappeared, and their art had almost disappeared too. The rules that should limit us were the rules of nature and her beauties that surround us. To learn the sculptor's language it was necessary to copy nature absolutely, for before we thought of what we had to say we had to learn how to say it with our modelling tools and chisels. At the Academy schools they were not too much bound by rules, for there was no academic system of modelling, and each successive visitor politely put on one side that of his predecessor. Imagination, said Mr. Colton, was very well, but clearness of vision was much more important. Nature was the great guide, but nature had given beauty with almost too lavish a hand, and most of us were blinded with her glory. Especially did this apply to a sculptor, because he could use so little—merely an atom—that had been worked over and over again and still sufficed. A sculptor must be prepared for self-sacrifice in the practice of his art, and Mr. Colton took as examples Harry Bates and Onslow Ford, both of whom sacrificed themselves to their art and died young. Bates accelerated his end by straining the muscles of his arm in trying to save a statue from falling. Another example was that of the young French student who covered his bedclothes over the model of his statue to prevent it from freezing and died himself from exposure. To succeed the sculptor must take the risks of his profession. Sketchy work was out of the question in sculpture, and although work that was both sketchy and uncouth was apparently having some success its day could not be long. Turning to Greek sculpture, Mr. Colton pointed out its qualities of fleshiness. In England, on the other hand, we talked too much about the "bony structure," and too much evidence of this structure gave sculpture a deathlike and an ugly look. Besides, the bony forms were not really hard as a stone is; they were always covered with skin and tissue. The flesh was at least as important as the bone, but flesh modelling had always been neglected in this country. Above all sculpture was nothing if not vital. All possible means should be used to suggest vitality, for without it all would come to the ground.

The Liverpool Cathedral foundations will, it is expected, be completed within the next two weeks. The actual excavations and construction have occupied about eighteen months, during which time an average of 120 men have been employed. The specifications, &c., for the superstructure will include the choir, the lady chapel, chapter-house, and the east end vestries.

PEMBROKE COLLEGE, OXFORD.

PEMBROKE COLLEGE offers feature of special interest to architectural and historical students, and was recently visited by the members of the Oxford Architectural and Historical Society. The master of the college (Bishop Mitchinson) met the party, and conducted them round the buildings. Pembroke College was originally Broadgates Hall, the buildings of which stood on the north side of the quadrangle, facing St. Aldate's Church. It was one of the oldest of the halls, and was a great home for the study of civil law. In 1612 it contained 131 members. The refectory, all that is left, is now the college library, a room formed over Docklington's aisle in St. Aldate's Church having for many years served as a library. The conversion of Broadgates into a college was the outcome of two legacies left for the foundation of a college by Thomas Tesdale, of Ludwell, and Richard Wightwicke, rector of East Ilsley, and was completed after a long dispute with Balliol, to which Tesdale's money was at first left. King James I. assumed the honours of founder, the Earl of Pembroke, then Chancellor of the University, gave his name to the new college, and the foundation was celebrated with great splendour in 1624. Broadgates Hall had been expanding since its foundation, Beef Lane and Michael Hall in Beef Lane, and various other halls and tenements being successively incorporated, and shortly after the foundation of the college a new quadrangle was begun, the east side of which was finished in 1670, the north side displacing old Broadgates Hall in 1673. In 1674 the Master's Lodgings were built, the old gardens being done away with; in 1868 a storey was added to the Master's Lodgings. The north boundary of the college was formed by the old city wall. A visit was also paid to St. Aldate's Church. The name is derived from "Aldgate" or "Old Gate," on account of the proximity of the church to the old south gate of the city. There existed a twelfth-century church on the site, which stood, perhaps, where the present chancel now is. The Norman arcading, much restored, which may now be seen built into the east wall of the north chancel aisle, and which formerly was in the chancel, belonged to this church. The south aisle or Docklington chapel was built by Sir John Docklington, 1535-6, as a chantry chapel, and formerly contained an altar. It was for many years used as a chapel by Pembroke College. Beneath it is a fine fourteenth-century crypt, with a groined roof. The old arcade, of three unequal arches, dividing the chapel from the nave, was removed in 1862, when the chapel was lengthened. The north aisle was added by Philip Polton in 1455 as a chantry; there is also a record of a small aisle, built in 1674 by John West, of Hampton Poyle, whose tomb, with effigies of himself, his wife and daughter, is now in the vestry. The tower and spire—rebuilt in 1873—were probably erected in the fourteenth century. There is a fine alabaster altar tomb to John Noble, who died in 1552, in the north wall of the sanctuary, and a fine Perpendicular font in the south aisle. In 1862-3 the chancel aisles were added, the south aisle lengthened and much rebuilding done.

The Surrey County Council at their last meeting received the final report on the cost of Kew Bridge, which showed that the total amount expended was 233,685*l.* 3*s.* 5*d.* Surrey's portion of the cost was 117,672*l.* 10*s.* 7*d.*, while Middlesex had to pay 116,012*l.* 12*s.* 10*d.* The joint committee recommended that Mr. W. G. Austin, who had acted as their clerk over a period of about eight years, should be paid the sum of 210*l.* for his services, this amount to be equally divided between the two Councils. The committee reported that a gold medal was awarded at the St. Louis Exhibition in 1904 for the model of the bridge. Arrangements had been made by which Surrey would retain the model and Middlesex would have the medal. An intimation had been received that, according to the regulations of the Exhibition authorities, the gold medal would be in bronze.

The Acton District Council recently decided upon the erection of a new town hall and municipal offices, for which the design of Mr. W. G. Hunt was accepted, and applied to the Local Government Board for sanction to a loan of 100,000*l.* for the purpose. The proposal was condemned by ratepayers. A reply has been received from the Local Government Board declining to entertain the application even to the extent of holding an inquiry, as it appeared to them the scheme had been designed on an unnecessarily elaborate and expensive scale.

NOTES AND COMMENTS.

IT is gratifying to learn that in the Municipal Technical Institute of Belfast there are Sir CHARLES LANYON memorial prizes. The architect who is thus commemorated did more than any other individual to make the Ulster capital what it is. This year the prizes in the senior division will be awarded for a set of drawings representing one of the following subjects:—Chichester Monument, St. Nicholas Church, Carrickfergus; Main Entrance to Bangor Church (co. Down); South Porch, Carlisle Memorial Church; Entrance Gates, Ormeau Park, at Ormeau Road, next Ormeau Bridge. The prize-winner will afterwards have to present sketches of architectural subjects of interest of a date prior to 1750. In the junior division the prizes will be awarded for a set of not less than six drawings of architectural ornament or construction. The drawings must be made from actual measurement, and must be taken from some existing well-known public or ecclesiastical building or buildings, which must be specified. Belfast is marked by shrewdness, and a guide to the prizes and scholarships of the Municipal Technical Institute by Mr. F. C. FORTH shows that sound instruction is obtained by local students at a moderate expense.

THE increase of interest in etching which has been witnessed in recent years must, we suppose, be taken as an endeavour to rival photography. The style of production which many have adopted can be quickly executed, and on that account the art has been compared to lyric poetry, as representing impressions which have not lasted for a long time. There is a risk, especially among young amateurs, of considering etching as quite a modern art in England. More than sixty years ago the Etching Club brought out excellent plates. Still earlier JOHN L. COTMAN etched buildings in England and France in masterly style. CONEY's architectural subjects were most careful, although his anxiety for accuracy sometimes impeded his dash and vigour. JOHN CONSTABLE produced a few small etchings, and E. W. COOKE's "Fifty Plates of Shipping and Craft" appeared in 1829. GEORGE CUITT was engaged in etching some of the Chester buildings in 1810. F. C. LEWIS appears to have been etching from 1802. MORTIMER's first etchings were published in 1778, and BARRY brought out his plates from the wall-paintings in the Society of Arts' premises still earlier. TURNER's etchings were only preliminary outlines for the mezzotinters. The South Kensington Museum contains a splendid collection of etchings and other prints, and a second part of the catalogue compiled by Mr. MARTIN HARDIE has been issued by the Board of Education, which will be a great benefit to collectors and students.

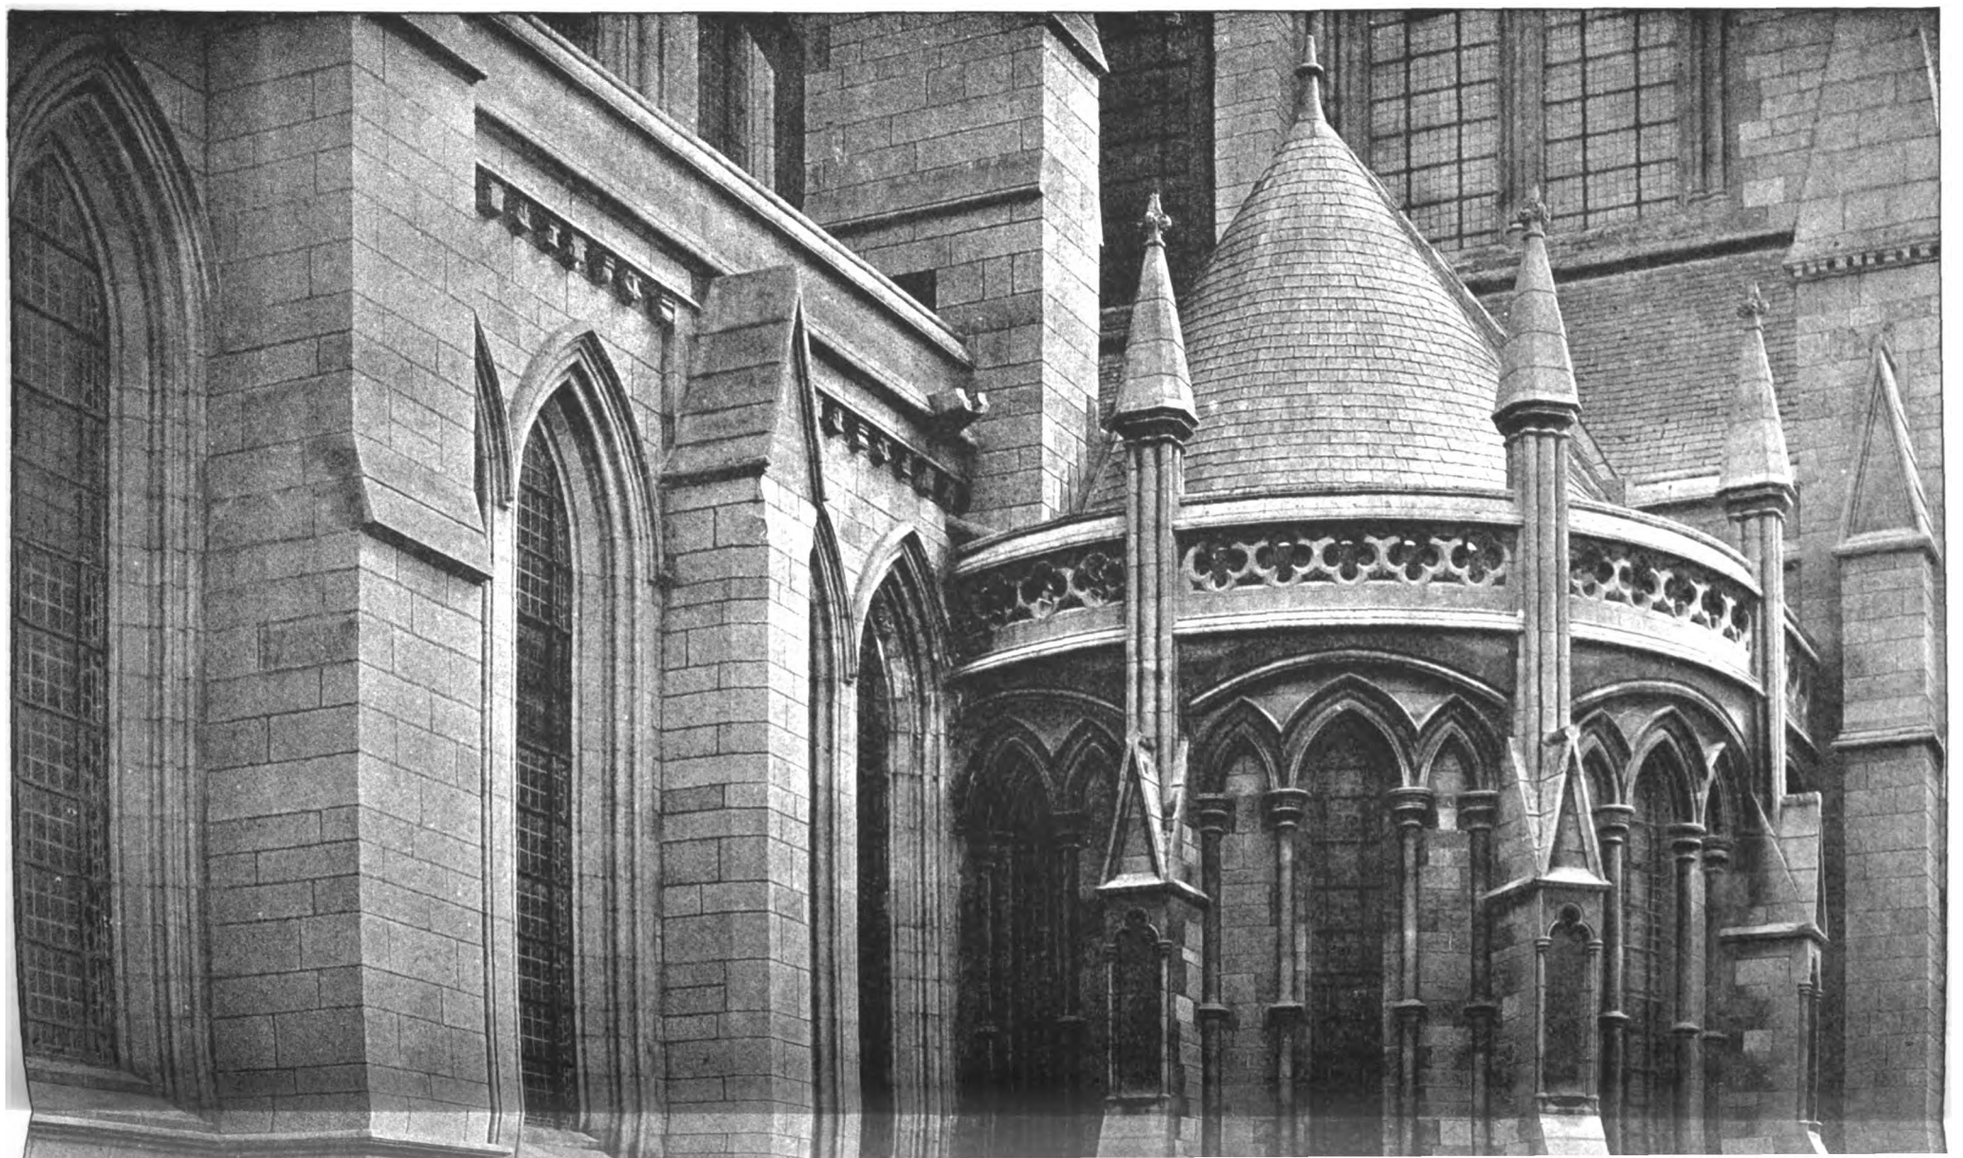
THE French rule by which a builder is responsible for his work during ten years after its completion is considered to be a hard one by English builders. But the case of PEDRETTE *v.* The Brighton Corporation, which came before the Court of Appeal on the 15th inst., suggests that it would be legal in England to keep a contractor responsible for six years if not for a longer time. We have before referred to the case while in the preliminary stages. The plaintiff executed works for the Corporation amounting to over 50,000*l.*, mainly for foundations of a generating station. It was necessary for him to give security to the extent of 8,000*l.* His bankers undertook the office on his depositing 6,000*l.* in cash and 2,000*l.* in securities. In addition, there was a reserve held back for a year after the completion of the contract. He received the retention money, but when he asked for his bond the Corporation declined to part with it, although the bank was released. The plaintiff sought to have the bond delivered to him, but Mr. Justice BUCKLEY dismissed the action with costs. Mr. PEDRETTE then appealed; however, he was not more successful. Their Lordships considered that plaintiff's responsibility did not end after a year had elapsed, for if any latent defect was afterwards discovered there would be a remedy against the contractor. The Master of the Rolls said there was a case in which it was found years afterwards that work had been scamped in some way or other, and in that case the liability of the contractor was established. His Lordship added that the liability continued upon the contractor and his surety for any latent defect in the work. It was not desirable that his liability should go on for ever, and it would not be necessary, because the Statute of Limitations applied to this sort of liability as well as to any other. It was not necessary to embark on that consideration, which was one of public policy. Parties could always protect themselves by special stipulations; if they did not they must take the benefit and the burden of the general law.

IN his "Architectural Sketching and Drawing in Perspective" (London: B. T. BATSFORD), Mr. H. W. ROBERTS calls attention to the indifference about perspective drawing which prevails in many offices. This he ascribes to South Kensington methods, which one architect called "a wheelbarrow in a cobweb." Students are perhaps disappointed on finding that what are considered the first principles have to be modified in practice, and no draughtsman who produces many drawings is entirely faithful to the rules in any one treatise or system. What STUART MILL says of algebra is to a great extent true of perspective, viz. "it derives none of its certainty from what are commonly taught to learners as its elements, since these, as laid down by some of its most eminent teachers, are as full of fictions as English law and of mysteries as theology." "R.'s Method," or Mr. ROBERTS's, can be described without injustice or dispraise as an empiric method. There is a reference to angles and tangents, and plus and minor signs are occasionally introduced. But all the exercises can be gone through without being subjected to any severe tests. The author relies to a great extent on sheets of ruled lines arranged at several angles, which he has already published and which we have praised as expeditious aids, especially in cases where perspective drawings have to be produced in a hurry. Whether Mr. ROBERTS's system will supersede those which have been long familiar may not be certain, but there is no question that a novice, by following his instructions and with the aid of his diagrams and lines, could produce an architectural or landscape perspective which would serve ordinary requirements.

ILLUSTRATIONS.

WATERLOO CHAMBERS GLASGOW: RESIDENTIAL FLATS.

COTTAGE HOMES, SHIRLEY, SURREY.



IN December we published views of the cottages, schools and other buildings erected by the Guardians of the Poor of the parish of Bermondsey from the designs of Messrs. NEWMAN & NEWMAN. The estate has an area of over 70 acres. The cottages are so placed that the view of one cottage is not obstructed by any other. There are double and single cottages, the former accommodating thirty children and the latter fifteen children. Altogether five hundred and seventy children are provided for. There are also residences for the staff, probationary block, porter's lodge, a school with ten large classrooms, and a drill hall which is used as a chapel, &c. The contract was carried out by Messrs. CHARLES WALL at a cost of 143,268*l.*

A COMPARISON BETWEEN THE MEDIÆVAL ARCHITECTURE OF ENGLAND AND FRANCE.*

(Concluded from last week.)

IT may be well to notice here some other points in which the Saxon love for wooden construction persists, such as the cushion capital, which probably had its origin in squaring off the four sides of a tree trunk where it is mortised into another timber, and the extreme fondness for arcaded and panelled decoration, much more natural in wood than in stone. There is also this to remember. When the Normans came to England they had already learned to build in stone probably from their Italian masters, but their predecessors, the Scandinavian invaders of the eastern counties, were, like the ancient Greeks, essentially a ship-building race, accustomed to the use of large timbers and of planking on curved surfaces. In the eastern counties, therefore, we find in several cases, as at York and Ely, stone vaulting imitated in wood, and, an original development to which there is nothing corresponding in France, in very elaborate open timber roofs made of large timbers. They are also confined to the eastern counties. Of the thirty-five examples in Brandon only one belongs to Gloucestershire and four to the Midlands. While in the French roof the tie-beam is a mere light tie often suspended from the main trusses by braces, as at St. Ouen, these ship-builders use a heavy tie-beam carrying the king-post, and when it sagged took to bringing forward the sole piece into the church and connecting it by long curved struts like ship ribs with the rest of the roof, and so developed the hammer-beam roof.

But with the Norman Conquest a most energetic impulse was given to stone construction. The Normans had by that time become far the greatest builders in Europe, and English Mediæval art never even attempted to escape from the influence of the great churches which were founded or rebuilt at the Conquest. The English cathedral is always the Norman abbey church modified or imitated. The three nearly equal, sharply marked horizontal divisions of the Norman design, with little or no expression of vertical continuity, persist almost to the end; the vaulting shafts seldom run down to the ground, but end sometimes on the abacus, as at Lincoln, or just above it, as at Exeter and Ely, halfway up, as at Salisbury, at the clerestory, as at Wells; the clustered columns are arranged and designed not in various groups and sizes, as at Bayeux or Coutances, so as to mark distinctly their various purposes, the arches, mouldings, or ribs which they represent or carry, but so as to bring in the greatest number of detached or semi-detached shafts, some of which may even have nothing to carry, as at Durham and Lincoln, and, since these were whenever possible made of Purbeck marble, which could only be got in short lengths, circular bands had to be introduced, and the abacus also became circular and uniform. That the pier should indicate and lead the eye up to the vault was the French ideal; that it should be beautiful in itself, the English one—so much so that, as in the very beautiful example of Exeter, the arch mouldings are even adapted to the pier, instead of the pier to the arch. The arch mouldings themselves soon become less grouped, smaller and much more deeply cut than in France, more like mouldings in wood, more in keeping by their strong contrasts with the black and white of the columns, well suited to our grey climate, and at their best, as at Lincoln and Durham, exquisitely beautiful. But as the use of marble in the piers ceases the mouldings become shallower and mere arrangements in grey, frequently worked on the chamfer, in striking contrast to those of late French work, which become deeper cut and more wire-drawn in order more clearly to distinguish the different ribs as they run down and make the verticality even more marked. On the other hand, the English mark the horizontal division even more by the introduction of the hood-mould over the pier arches, an outside feature by rights, a sort of bolection moulding in stone, marking off the arch with a sharp dark line. Again in contrast with the French, the wall which disappears with them till the incessant vertical lines give a sense of irritating restlessness to their later styles is in English work everywhere visible, and its restful suggestion of strength and quiet repose most grateful, while the long drawn-out perspectives of aisles and arcades give the special character to the whole which in France is found in the soaring elevation of each separate vaulting bay.

But the real glory of our English art is to be found in its latest form, due to the way in which the English mason when left to himself, and deprived during the Hundred Years' War of all French influence and help, reasserted his own originality and worked out a completely new system of vaulting, which gives to our Perpendicular a stately life and vigour almost lacking in late French Flamboyant. The early French vaults were so largely influenced by the domical vaults of south-west France, such as that of Poitiers, that the builders hardly got rid of the idea that each vaulting bay ought to be a separate entity, by preference a square, as in hexapartite vaulting, and at least domical, if not a dome.

This feeling never influenced the Normans, but from the very first, as at Durham, they tried to keep the ridge level, using segmental ribs and stilted wall arches. But these level-crowned vaults are weaker as a whole than the domical ones, and each panel in itself is weaker in construction, because in the French vault the half wall arch or half transverse arch, as the case may be, is divided into the same number of parts as the half diagonal rib, which, of course, is the longer, and each row of stone is laid as an arch from one to the other on a movable sliding centring or "cerce," and as each course becomes of necessity broader towards the diagonal the whole panel rises with a twisted or plough-share curved surface, as at Amiens, to a straight-arched joint joining the top of the wall arch or transverse arch to the intersection of the diagonals. But if the mason is unskilful and does not distribute the difference in length between the ribs evenly over his courses he gets some of them wedge-shaped, and ends with a joggle instead of a straight joint along the crown. This may be well seen in several bays of Westminster cloisters. To the Englishman, accustomed to curved planking on his ships, it seemed much simpler to treat the courses like planks of the same width all along, and dividing therefore the half rib and half arch into an unequal number of equal parts, instead of, like the Frenchman, into an equal number of unequal ones, he got not a straight joint, but a dovetail along the ridge, and his vaulting panel ceased to be curved and self-supporting and became flat and weak. So an intermediate rib or lierne was inserted to strengthen this, and then others, till after passing through the stage of Lincoln we reach such a beautiful form as Exeter. But a difficulty arose with these liernes. They varied greatly in length according to their position, and were all much shorter than the diagonals. Either, therefore, the ridge could not be kept level or the curves of the shorter ribs must be "judged," as at Minster. Where the curve changed a short cross rib or tierceron was put and a star of lozenge pattern obtained with the ribs, as in Worcester cloister and at Christchurch. Then bosses were put where the ribs intersected, as at Lincoln and Canterbury, and all sorts of fanciful arrangements of the ribs indulged in, till the practical result was a ribbed waggon vault with intersections, as in Winchester nave and Gloucester choir, while from the number of ribs of similar curve springing from one capital and meeting a flat ceiling arose the fan vaulting of the cloister, where the curves are simple. Then from changing the curves to make them meet a level ridge where there was no flat ceiling arose the four-centred arch, the form usually adopted in fan vaulting, and which naturally, as the pointed arch had done previously, descended through the wall arch and window heads into all the rest of the building. Having thus got the idea of this cone of spreading ribs, it was ingenious to bring it out from the wall and spring it from a pendant as centre, as at Christchurch and Oxford Cathedral, or even to bring it out so far as to quite complete the cone and let it meet another half cone springing from the wall, as in the Divinity School, Oxford, and that final masterpiece of Henry VII.'s Chapel, so easy to criticise, so impossible not to admire. The important point to notice is that in these latest vaults the true function of the multiplied ribs has entirely disappeared, and they and the intermediate parts are all cut out of large blocks of stone, and we have returned to the Roman waggon vault, with its continuous thrust, a strange result to follow from a slight alteration of the arrangement of the stones in the vaulting panels, and yet inevitable from rigidly following artistic reasoning. It is rendered all the more striking by the fact that the French, who strictly adhered to their original system, never arrived at these rich vaults. Here and there, as at Caudebec, we find a pendant taking the place of a central column, but it is

a *tour de force*, and in late French vaults, as at Abbeville, pendant bosses are quite common and lierne vaults, as at St. Riguier, not uncommon; but when we meet with anything like elaboration, as at Rue, it is a piece of fanciful decoration, not a natural artistic development.

Time will not allow of our following out fully the development of window tracery in the two countries. France got ahead of us in the earlier stages, owing chiefly to our adherence to the long, narrow lancet, a singularly beautiful form, especially in the triplet and in larger groups, as at Salisbury and York. Its origin is a little puzzling. I believe it was simply the translation into a pointed form of the triple arch of the Norman clerestory, with the centre opening higher than the others. Our specially English Perpendicular seems to have sprung from Reticulated tracery, itself a development and modification of our flowing Decorated, our English, but much more beautiful, version of the French Flamboyant. St. Mary Redcliff, a very striking example of our later style, shows us a Reticulated and a Perpendicular window almost precisely similar at the east end. It is worth while to compare this interior with that of Abbeville. On the whole I think the English example is the finer, beautiful though the other is. Although the English example is a good deal the earlier, yet they may be taken as the last word of the art of the two countries before absolute decay began. We have no church of the first rank as late as Abbeville; perhaps St. Michael's, Coventry, comes nearest.

Let us now glance back at the results of our study. In spite of some resemblance there can hardly be a greater contrast than that between the French and English cathedral. In the exterior of the former, which is generally obviously the result of one great effort, the walls are standing in slices at right angles to the building which they support but do not enclose, towering high above it, and seeming to push and thrust with all their power to keep up its enormous height. It is very wonderful and very beautiful, but leaves a sense of constant effort to overcome difficulties after all only partially vanquished. What a difference is there in the peace of the long, low English cathedral, with its insignificant buttresses and unambitious lines, with no traceried canopies or wealth of sculpture, and, except for the upward pointing of its central spire, seeming content to remain on earth, and telling in its unequal parts and varied styles, not of a mighty impulse which faltered all too soon, of a lofty enthusiasm which died down to mere mechanical dexterity, but of successive generations of commonplace yet earnest men, each bringing its little stone and saying, "Add this to the rest. Take it and try its worth; here dies another day."

And in the interior also the story is the same. In the English church we trace the stolid acceptance of existing facts, which preserves all that has gone before, however imperfect, and, adding here and changing there, makes up a building, humble-minded, as it were, with a wooden roof perhaps, content to suffice for the needs of the present, telling in every corner of the makeshifts of the past, with no sign of anxious, unrealised ambition for the future, incapable of perfection because begun and ended incessantly, and always without continuous design, yet breathing out an indescribable charm of sympathy almost human in its loving reverence for the results of all past human effort. But in the other the soaring lines which guide the eye upward ever to the vault of stone poised miraculously on its walls of painted glass seem to tell of master minds of long ago, of those few to whom God whispers in the ear.

For when earth had attained to Heaven there was no more far nor near for those who, greatly daring in their implacable logic, swept ruthlessly away all that had gone before, had planned to raise a structure complete and harmonious all through, the absolute expression of one overmastering ideal of future perfection, bound to remain incomplete at the last from the weakness of all human aims and means, for they had aimed at the high that proved too high, the heroic for earth too hard, yet therein lies its undying power. While our cathedrals tell of the strong consciousness of the historical continuity of the nation which has made of the English a governing and imperial race, the Mediæval architecture of France is the expression of that logical and artistic nature which has made the French through all European history the originators of the noblest social ideals, the exponents of their highest expression in art. And here it is that the French art towers far above the English. It is far more the expression of the nation's soul. So far as building only makes use of its materials dexterously, appropriately, beautifully even, with limbs and fingers only, it falls short of the highest; so far as it lays open the soul of the man or of the race, it reaches it. The expression of closely-reasoned design in admirable construction and suitability to its purpose is perfect in such a building as Notre-Dame, or Amiens or Reims. No more marvellous temples for the worship of God can be imagined. Yet it is not in that their chief glory resides, but in that artistic sense which made of the French cathedral a perfect combination of all the arts, more complete than even the Greek temple, because not only are its parts as inseparable and even more perfectly co-ordinated, but because it is the expression of a fuller ideal as belonging to a later, more complex civilisation, the work of a race as highly strung as the Greek. This artistic expression is found most in that part of the cathedral which was the least fully worked out—the great west front. There is not one which is not open to the severest criticism as to proportion, adaptation to its purpose, disposition of lines and parts. Yet there we find the full expression of that indefinable quality, the artistic sense which all the Latin and Greek races possess, but which is lacking more or less, so far as regards the material arts, in almost every race of Teutonic origin. Just compare Notre-Dame with Wells, Amiens with Salisbury, Chartres with Peterborough, York with Abbeville. The sculpture of Wells is a work of genius, full of life and expression and high qualities of execution, but what a poor and monotonous design, with mouseholes for doors and tall columns like scaffold-poles all up the front. Then take Notre-Dame. Its horizontal lines are too strong, and it is too much cut into squares, but what restfulness in the wall spaces, how beautifully the statues on the piers carry on the line of sculpture, what noble proportion and sense of scale. Why, the Arc de l'Etoile is exactly the same size, and looks about half, and, above all, what wealth of marvellous imagery. Then put Amiens and Reims by the side of Salisbury, with its meaningless jumble of petty disconnected parts, or of Lincoln, with its senseless screen, or Lichfield, with its shopful of squat statues on brackets. Amiens had its towers cut in half for want of funds; Reims was set back on its ground floor and never finished for the same reason. Both lack the repose of Notre-Dame, yet, with all their defects, which are many, especially the bringing forward of the door jambs at Reims in front of the buttresses, how wonderful they are. And remember each of these fronts has a complete system of iconography, which I cannot explain to-night. The main point to note is that all French sculpture from the very earliest period shows the artistic genius of the race. Take the statues from the west front of Chartres, which date from about 1140. Their excessive elongation, which strikes us as archaic, is not entirely so, but due to a naïve, artistic feeling that, placed as they are amongst columns, their lines ought to harmonise. Then if we look at the faces, they are studied from nature, and are of a thoroughly French type, but idealised. Indeed, they are much more individual than those of the end of the twelfth century, when there is a tendency to adopt a definite generalised ideal. When we come to thirteenth-century work, such as that of Notre-Dame, note the calm and breadth of the work, especially of the angels and the double row of heads and the wonderful figures from Reims, all as fine as any Greek art, far more a part of the building to which they belong, and full of what Greek art in its search for perfect physical form generally lacks—the sense of living humanity and of humanity conscious of its power to rise above itself.

Then with the heavenly calm of the blessed contrast the wild confusion, the rush and whirl of the other side. Note especially the Horsemen of the Apocalypse, Famine, and, most of all, Death. I know nothing to equal it. He who rides on the pale horse is shown here as a woman with blindfolded eyes. She has leaped in front of a man, exultant in his strength, and stabbed him with a huge knife so that his bowels are pouring out, and he has fallen backwards over the horse dead and limp, while she, clinging tightly to the creature's neck, is making him rush on with outstretched head in an agony of terror. The whole is the most awful drama of human life and death. I might go on to compare the grand triple porch of Peterborough—and it is very impressive—with the great porches of Chartres, and we should find the same difference in artistic quality. But, leaving this work of the best period, let us take some of the latest, and even there we shall find the same. Even now, worn down as it is, there are few more exquisite things than the great porch of St. Maclou, and its tympanum of the Last Judgment is almost as fine as that of Notre-Dame. Hear what Ruskin says of it:—"The sculpture of

Digitized by Google

the inferno side is carried out with a degree of power whose fearful grotesqueness I can only describe as a mingling of the minds of Orcagna and Hogarth. The demons are perhaps even more awful than Orcagna's, and in some of the expressions of debased humanity in its utmost despair the English painter is at least equalled. Not less wild is the imagination which gives fury and fear even to the placing of the figures. An evil angel poised on the wing drives the condemned troops from before the judgment seat; with his left hand he drags behind him a cloud, which he is spreading like a winding sheet over them all; but they are urged by him so furiously that they are driven not merely to the extreme limit of that scene which the sculptor confined elsewhere within the tympanum, but out of the tympanum and into the niches of the arch; while the flames that follow them, beat by the blast, as it seems, of the angel's wings, rush into the niches also and burst up through their tracery, the three lowermost niches being represented as all on fire, while, instead of their usual vaulted and ribbed ceiling, there is a demon on the roof of each, with his wings folded over it, grinning down out of the black shadow." Then put Abbeville by the side of York. The latter in its cold precision of rule and triangle and perpetual perpendicular panelling is only not dead because it has never really lived, not dumb because it never was taught to speak; while the other, though that saddest of all earthly things, an unfinished ruin, yet speaks all over with a thousand tongues. Though one of the latest buildings in France, a mass of prisms, of interlacing curves, scientific and geometrical from base to summit, it is full of an artistic feeling and poetry almost entirely absent from the other.

I do not say that either the science or the art of the Middle Ages, English or French, is a thing for us to imitate nowadays. On the contrary. But I do say that it is deserving of all our study and all our admiration. It belonged to the men of those times; it was the expression of their need and the fulfilment of their history, and its expression in their lives; it tells us of the ideal at which they aimed and how they strove to reach it. It sprang from their heart, was part of their life. Can we say as much of our art of to-day? Pardon me if before I conclude I rapidly review the main results at which we have arrived.

I have tried to bring before you not mere differences of style founded on details of moulding or tracery, things of no real importance, but to show you how English and French Mediæval architecture are each of them the outcome of the character of the race, the result of the history of the nation, the expression of the people's ideal.

The same national characteristic of "drift" which is ours to-day, and which takes us muddling along with no definite aim or plan for the future, and which led Edward III. in his blundering rush across Northern France till he was brought to bay on the hillside of Crecy, led also the workmen of his time to close their vaulting panels just anyhow, provided they got them closed; the same sturdy common sense and determination to stand shoulder to shoulder in whatever they undertook, which made the king dismount his knights and place them side by side with the peasants, row over row, on that gentle slope, and which gave to them all when thus united the power

> To turn to flight on that famed Picard field
> Bohemia's plume and Genoa's bow and Cæsar's eagle shield,

made them also build their walls always thick enough to carry the vaults or else rest satisfied with a wooden roof, and caused them also to be content to mend and patch their heritage from the past rather than sweep it all away in the hope of replacing it by some marvel of quite unattainable perfection in the future, till in the end the gradual blending of all classes and of their aspirations made itself felt in their art, as in their social life, and the architecture of the cathedral, the monastery and the castle found its last expression in the village church, the manor-house and the farm. In art, as in empire, the English race has ever been the same—opportunist, realistic almost, incapable in material matters of ever forming an ideal much above the here and now of daily life, yet blundering unconsciously in spite of themselves into marvellous results in both art and empire.

And so with France. It was the same chivalrous devotion to an ideal which drove to death the knights at Crecy and Agincourt, which also inspired the burghers of the communes with their wild enthusiasm for liberty and with their determination to find for their thankfulness a visible expression in their vast cathedrals. It was the same pitiless logic and thirst for an ideal which dictated the unswerving policy of Louis XI. and of Richelieu, which later made the nation sweep away all its past in a torrent of blood in the vain hope of bringing back the golden age, and which also in art inspired the reasoning and the artistic sense whereby the builders of Vézelay and of St. Denis were led on from Notre-Dame through the perfection of Amiens and the lovely folly of Beauvais and the ruinous, unfinished beauty of Abbeville to the last wire-drawn skeleton of a sixteenth-century church. Through it all, up to the very end, these builders were true artists, aiming at expressing a something higher than themselves which should draw up into sympathy with them all that was best and noblest of those around them. Which of the two nations did best? It is an old question, which each artist —each man—must answer for himself. Whether it is better to aim at a lofty ideal which, proving beyond our reach, may become a mere dream of Heaven, or to be content with a lower one within our grasp, even though it may keep us bound to earth.

Mr. W. H. SETH-SMITH, in proposing a vote of thanks to Dr. West, said they had all enjoyed his paper, which was a wonderful combination of the artistic, constructive and historical elements of the subject. The reason, probably, for the masterly treatment of the constructive side was that Dr. West had been thoroughly trained as an architect both in England and France, and that he had had the special privilege of being associated with Viollet-le-Duc. The lecture they had heard was most important, because it would make men sympathetic with Gothic work, and counteract the strong tendency that existed nowadays to set it aside in favour of Classic studies. For his own part, the speaker said he had much sympathy for Gothic, and he was always pleased when their students got opportunities of hearing such lectures, which emphasised the logical outcome of Gothic work.

Mr. H. STANNUS, who seconded the vote of thanks, said the paper had been so perfect that it was impossible for any one of them to criticise it. In the short space of time given to the reading of the paper he had never heard such an admirable explanation of the differences between the two great styles, French and English Gothic.

The PRESIDENT joined with the meeting and thanked Dr. West for his brilliant, delightful and intellectual lecture, and the evening terminated.

ROOFS, SCREENS AND ROOD-LOFTS.

A LECTURE on "Some Points of Architectural Interest in our Parish Churches," forming the first of a series, was delivered at Carpenters' Hall, London Wall, E.C., on Thursday evening, the 15th inst., by the Rev. Walter Marshall, M.A., who stated that with regard to the beauties which Mediæval architecture presents to the architectural student, there are few more striking than the open timber roofs which adorn so many of our churches and halls, testifying to the constructive skill as well as artistic feeling displayed by the carpenters of that age. The effect of these roofs, with their bold receding arches, massive, richly moulded and carved timbers, spandrils filled with intricate tracery, profusely ornamental cornices and exquisitely carved bosses, should rivet the attention of every spectator. When there is added to this the blaze of rich colouring, of which most of the roofs show traces, the result attained would be a degree of splendour that it is difficult to imagine in these days of more sombre treatment.

There is an absence of open timber roofs, the lecturer went on to say, in the early period of Gothic architecture, which appears very unaccountable at first, because one would naturally suppose that as timber roofs of a necessity preceded stone vaulting, the most beautiful and elaborate forms of roofs would also occur prior to the magnificent examples of groined vaults in stone, which still remain in all our cathedrals and many parish churches as monuments to the constructive skill and genius of the masons of the Gothic period. But the reason for this is not far to seek when the serious fires are taken into account that destroyed Canterbury and other cathedrals about this time; the builders, finding that it was possible to use stone for roofing purposes, soon became so proficient in the use of this material that the mason seems to have excluded the carpenter almost altogether, both from constructional and ornamental work.

The best and most numerous examples of timber roofs occur in our parish churches, and a few old palaces and halls, which still remain as relics of kingly and baronial

Digitized by Google

magnificence. The timber used was nearly always oak or chestnut, and the different parts were always mortised and tenoned together and fixed with wooden pins, no iron ties, straps or even nails being used in any part.

Roofs may be best divided into five classes:—(1) Tie-beams, (2) trussed rafter (or single frame), (3) hammer-beam, (4) collar-braced, and (5) aisle roofs, but in many instances these classes became combined in one roof. After giving a minute description of the different roofs, of which illustrations were also shown by means of lantern photographs projected on a screen, the lecturer concluded this part of his subject by remarking that of course colour played an important part in the decorative splendour of Mediæval roofs, but the general practice was only to tint the mouldings and carvings. In flat roofs the panels were frequently painted blue and powdered with gold stars. The enrichment of the portion of the roof over the altar was generally observed; it sometimes consisted of the whole chancel, but more often of one or two easternmost bays. The importance of colour to accentuate mouldings at a height, and for giving prominence to carving and heraldic devices, cannot well be over-estimated, as these bright touches of colour do much to light up the sombre effect of the woodwork, and thus greatly enhance its charm.

The succeeding portion of the lecture was devoted to the subject of rood-screens and lofts, and the lecturer pointed out that a clear distinction must be made between the rood-screens in a cathedral or collegiate church and those in a parish church. In the cathedral or collegiate church the screen, almost invariably of stone, is of much more solid construction than in the parish church. In both types of buildings it answered the purpose—one amongst several—of dividing the nave from the choir. But in the cathedral this division was of necessity far more marked than in the parish church, because the choir was reserved for the use of the clergy, provision for the laity being made in the nave. The choir of a collegiate church before the Reformation may therefore be considered as a church within a church, and thus this choir was not only cut off from the nave by the solid screen, as shown at Tattershall (Lincs), but also when there were aisles to the choir they were shut off by screens, but not generally of so solid a character as the rood-screen. It was necessary no doubt to have these solid enclosing screens to a collegiate choir, in order that the clergy might not be disturbed during their offices, and also that they might receive some protection from the draughts inevitable in a large building. But their use was also symbolical as well as practical; they marked the separation between the faithful and the sacrifice, the nave and chancel, emblematic of the Church militant and the Church triumphant.

The lofts were used for various purposes. The priest read from them the Epistle and Gospel, and for this purpose the rood-loft in a collegiate church was capacious and easily accessible. To show the size of one of these rood-lofts reference was made to Lincoln Cathedral, where the loft measures 42 feet in width by 12½ feet in depth from east to west; thus a considerable space was provided for an elaborate ceremonial in which not a few could take part. Altars, of course, were not uncommon in rood-lofts, even in parochial churches, as at Maxey and New Shoreham. Sermons were also preached from this position before pulpits were introduced, and announcements were made therefrom. It was also occupied by the "minstrels," and constant reference is made to "a pair of organs," *i.e.* one complete organ, in inventories. Of course these organs were quite small and wholly different to the instruments which sometimes assume such enormous proportions in these days. But although organs are in danger of occupying a too prominent position, architecturally and ritually, in our churches, still it must be remembered that the organ for centuries has been placed in the rood-loft.

Coming now to the parish church, it was apparent that almost all churches before the Reformation were provided with a chancel screen and a rood-loft placed upon it; however, the screen seems to have been used first without the loft, because the earliest examples of screens do not seem to have carried any loft, as, for instance, the beautiful screen shown at Stanton Harcourt (Oxon), which is probably the earliest example of a chancel screen existing in England. It seems impossible to say the precise period when these rood-screens were introduced, but it was probably about the thirteenth century, because frequently in Norman and Transition Norman churches there is distinct evidence that the jambs of the chancel arch have been cut away for the fixing of the screen, and also in some cases for the insertion of the rood-loft staircase. The fine church at Walsoken (Norfolk) shows this very clearly. In parochial churches the screens and lofts were nearly always of timber, stone screens being the exception. It is not very often that more than one staircase is found to the loft, and it occurs on both the north and south sides indiscriminately, whichever was the more convenient. Sometimes the staircase was developed into a turret, thus becoming a delightful feature, as shown in the internal and external views of Lavenham (Suffolk).

The tops of most of the rood-screens to-day present an unfinished appearance, which is owing to the destruction of the rood-loft, in accordance with the royal injunctions of 1564, and in 1576 Archbishop Grindal makes inquiry, "Whether your rood-lofts be taken down and altered, so that the upper part thereof with the loft be quite taken down unto the cross-beam, and that the said beam have some convenient crest put upon the same." This inquiry explains the disappearance of the rood-lofts and roods (not a single example of a Mediæval wooden rood being known to exist), and also it explains why the screens beneath them, separating the nave from the chancel, have been allowed to remain *in situ*.

On many other points bearing upon the subject the lecturer gave much interesting information, illustrated with numerous beautiful photographic lantern views, which the large audience evidently duly appreciated, and at the close a unanimous and hearty vote of thanks was accorded to the Rev. W. Marshall for his admirable lecture, while, at the instance of the Worshipful Master of the Carpenters' Company, a vote of thanks was also tendered to the Dean of Chichester for presiding on the occasion.

IMPROVEMENT OF EDINBURGH.

An address was delivered by Bailie Dobie to the members of the Edinburgh Architectural Association on "The "Æsthetic Duty of a Corporation towards a City." Mr. H. O. Tarbolton, president, was the chairman.

Bailie Dobie said that the beauty of a city depended on two things—the natural configuration of the ground on which it was built and the tasteful ingenuity of man. Edinburgh occupied a first place in the ranks of the former, the position of the Old Town set on the ridge extending from the Castle to Holyrood being of such a nature that almost any arrangement of buildings would, on account of the irregularity of the site, be quaint and picturesque. In cities like Edinburgh, where nature had given such a site and surroundings, man had felt that little was required of him. The city attained a certain dignity and beauty without his aid; he turned his attention in other directions. It appeared to him that was not the right way to look at the matter. If their forefathers had taken advantage of the wonderful opportunities offered them by nature, and, in addition, had made the same strenuous endeavours that less favoured communities had to use, the result might have been a vision of beauty very difficult now to imagine. Nuremberg was cited as a case in point, where the old Mediæval architecture was retained and no building was allowed to be altered or rebuilt without the permission of local authorities. Say that this principle, as recently even as sixty or seventy years ago, had been adopted in connection with the "Royal mile" from the Castle to Holyrood and all the northern slope of the ridge; say that their forefathers had been wise enough, instead of filling up the Nor' Loch, to have deepened it and kept it clean and fresh, and at a later date had prevented the railway company from irretrievably destroying that splendid valley, they might have had in their very midst a picture which, he ventured to say, could not be equalled anywhere else in the world. That this spirit did animate the rulers and citizens of Edinburgh at one time was proved by the splendid conception and carrying out of the plan of the New Town, and for that their successors were under an eternal debt of gratitude to them. Unfortunately this development of civic art in Edinburgh did not continue; it was followed by a period of pure utilitarianism, from which it had only emerged at intervals. During the last fifty years much had been done in the city that should not have been done, and chances innumerable of producing features of great civic beauty had been ruthlessly thrown away, but it was not yet altogether too late to prevent destruction of much that was well worth retaining, and it was possible to improve a great deal of what was objectionable and unsatis-

Digitized by Google

factory. Above all, it should be the duty of every citizen to earnestly strive to see that what was done in the future was for the lasting benefit of the city and the dignity of the capital.

For want of some central organisation of taste watching carefully over the amenities, buildings were erected with reference to no other consideration than the personal interests of their promoters. Some cities excelled in their development along the lines of municipal art because the people themselves were artistic. Take Paris, for example. If a new building of importance was to be built, a model of it and the surrounding buildings was made, so that the effect could be judged from all points of view. If such a course was adopted in Edinburgh, would there not have been an outcry before it was too late against the mass of the North British station hotel, which dwarfed and destroyed by contrast the post office and register house, and even seemed to put the Calton Hill itself out of scale, and would they have permitted the straight line of the Caledonian station hotel to cut off one of the finest views they had in Edinburgh? The same course was followed in Paris in connection with the erection of decorative sculpture. He need not argue that it was desirable to attain civic beauty; he took it for granted that every one desired it. Neither need he go into the financial aspects of the question further than to say that it had been shown very clearly by other cities, but most notably in the case of Paris, that very large sums of money spent judiciously in the beautifying of streets, open spaces, gardens, &c., were well invested and brought return to every class of the community by attracting visitors and residents. He unhesitatingly said it was the duty of a city possessing such advantages as Edinburgh to make the very most of them, and it was the duty of the Corporation of a capital city to make such necessary regulations as should prevent anything likely to interfere with its beauty and interest. The Council, too, should devote more attention to civic art; but in this they must be heartily supported by the community generally, because it was only by the definitely expressed wish of the citizens that anything important could be accomplished. Municipal representatives, as a rule, were inclined to look in other directions for the welfare of the citizens. Sanitation, public health, cleaning, police arrangements and many other things were all necessary for the well-being of a community, but he held that municipal art and the material dignity of a capital should have with these things equal consideration. But they had not been much thought of. The municipality had left the individual to his own devices. The result had been heterogeneousness and confusion, and there had not been sufficient public opinion to stir them to action either in the direction of control or initiation.

There were two matters which had to be considered—first, preventing the individual from doing anything which would impair the beauty of the city; and, second, the Corporation themselves making improvements, which meant the spending of money from the rates. With regard to the former, there were many ways of limitation. Feuing plans should be laid out for whole districts instead of for merely the small piece belonging to a particular owner, regardless of the plan of his neighbours, and for the purpose of having roads and streets of sufficient width, sufficiency of open spaces and other matters the local authority should have supreme power. This authority, which was at present both the Town Council and the Dean of Guild Court, and should probably be the latter, should be strengthened from outside by artistic advisers, either with statutory powers of veto or advisory powers only, in which latter case the success of such work would depend on the depth and continuance of the active public interest taken in the matter. As a mere indication, he ventured to suggest that such a committee as he spoke of might consist of, say, the President of the Royal Scottish Academy, the President of the Architectural Association, the Professor of Fine Arts, the Chairman of the Cockburn Association, the Chairman of the New Art School, which, he trusted, would soon be an accomplished fact; the President of the Antiquarian Society and other gentlemen of a like character. This committee might have a certain control over the decorative quality of the architecture, of the heights of buildings, the kind and colour of material to be used for construction, and generally with everything which affected the amenity of the city. Hanging signs should be of artistic importance in proportion to the class of street they were in; lamp-posts might be better designed; if they were to have overhead wires for tramways care should be taken with the poles and brackets; chimney-stalks where they were likely to interfere with the amenity should be prohibited or specially designed. The high tower of the Calton Gaol, for example, was a chimney-stalk; and business signs might be subject to some measure of control to prevent them running to riot, as they did in some places.

Dealing with the point which, he said, required very serious and immediate consideration, viz. the case of old buildings of historical, archæological or architectural interest, Bailie Dobie referred to the regulations which Professor Baldwin Brown, in his book on public monuments, mentioned as existing in other towns on this subject. He (Bailie Dobie) about a year ago made an attempt to get a register of all such buildings in Edinburgh made with the intention of trying ultimately if, in one of their provisional orders, it were not possible to get powers to prevent alterations without consent of the local authority. As a general indication of the lines to go upon, he would go the length of suggesting that the whole of the "Royal mile" should for this purpose be scheduled. Some such committee as he had spoken of should also have some power of initiation and suggestion of schemes for the improvement or beautifying of the city to the Town Council, with whom, of course, would be the ultimate decision if it were to be carried out or not. For many years Edinburgh had spent very little money on anything that assisted materially to develop municipal art. The rebuilding of the North Bridge was a striking example of a missed opportunity. Compare this clumsy erection with the graceful Alexandre III. bridge thrown over the Seine a few years ago, or the new bridge over the Danube at Budapest, which were true works of art and a constant pleasure to look at for themselves alone. He could think of nothing else for a long time except the partial rebuilding of the back part of the Council Chambers and the restoration of the piazza on the High Street front; and it looked as if they were again going to lose a golden opportunity by not adding something toMr., Usher's gift, and secure a city hall worthy of the Scottish capital. In this, as well as other important public work such as the rebuilding of the North Bridge, an architect either by selection or competition should be chosen rather than city officials, who had their own well-defined lines of work.

Thanks to private enterprise, however, there had been many fine buildings erected in Edinburgh within recent years, and the most important of all was unquestionably the west side of North Bridge Street, built by the proprietors of *The Scotsman*. This was one of the most important sites in Edinburgh from a picturesque point of view, and there was a risk of it being made or marred by what was put on it. Luckily for the city, it was taken in hand intelligently and with splendid liberality, the result being a beautiful street and a credit to the city. Several of the banks and insurance companies had from time to time even in recent years given them noble specimens of street architecture; and when they saw private companies and firms going to such expense on the purely decorative parts of their buildings, he believed they had therein encouragement to think that the community generally would exhibit a spirit of self-sacrifice sufficient to enable some such restrictive measures as he had indicated to pass, and also put their hands into their pockets for the comparatively small amount per annum that would be necessary to make their city even more than it was at present a "city beautiful." There were other æsthetic duties the Corporation might perform, which he had not time to enter upon. There was, for example, the duty of the Corporation towards the graphic arts—direct purchase of pictures from the annual exhibition and possibly elsewhere, the founding of a suitable art school, the finding of a site for a new national gallery. It all went to show that the Corporation of the city had æsthetic duties to perform, the importance of which, he ventured to say, the majority of the members utterly failed to grasp; and he thought it was the duty of an Association such as this to lead the public, and by combination with other bodies, by meetings, by agitation, and generally by means that the ratepayers as a whole knew so well how to adopt when it was a subject that interested them, to force their representatives to give the attention to those matters which, he was sure they would think as he did, were of very vital importance.

Mr. Richard Augustus Withall, of Branksome, Lytton Grove, Putney, architect, formerly of 29 Great George Street, Westminster, who died on January 28, left estate valued at 63,056*l.* 15*s.* 5*d.* gross and at 62,954*l.* 17*s.* 10*d.* net.

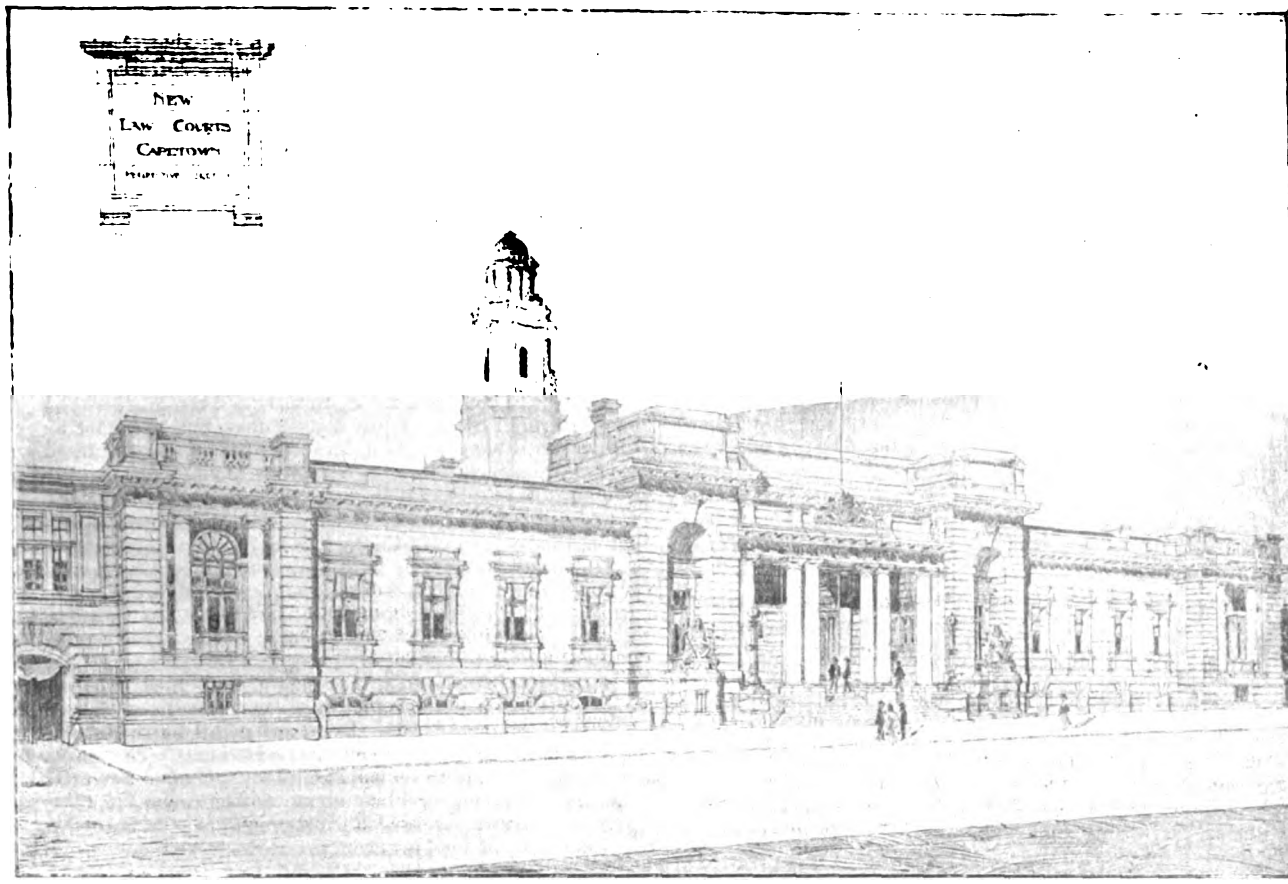
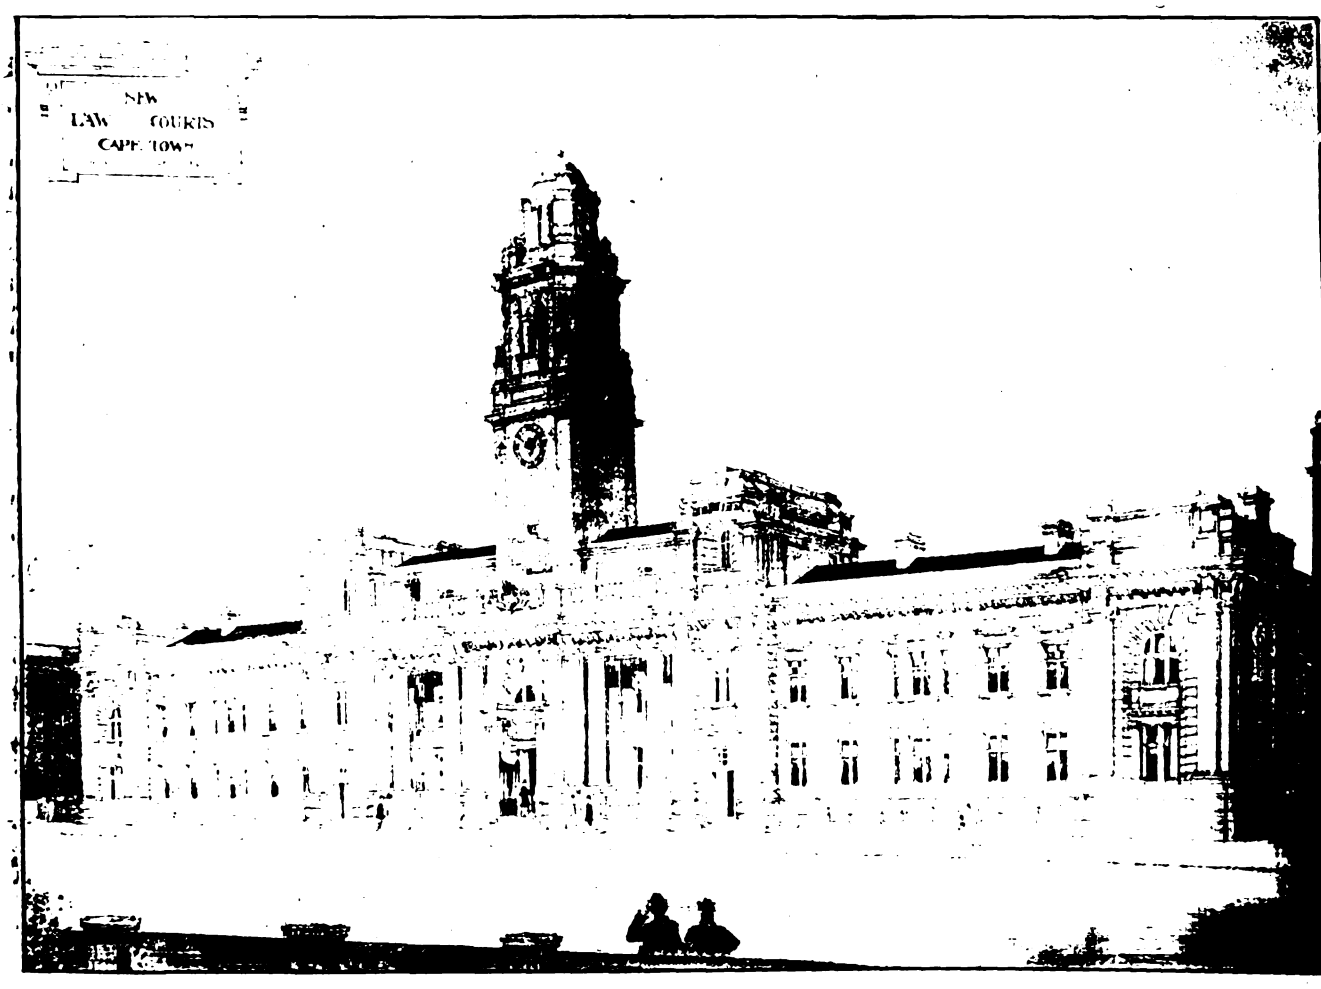
THE "ARCHITECTS" OF IRISH COTTAGES.



A PAPER on "Housing of the Rural Labourers" was read by Mr. R. M. Butler, architect, in Dublin. After describing the character of the cottages erected under the Act since 1883 to March 1905 at a cost of 3,288,829*l.*, he said that were only qualified architects employed at a suitable remuneration, the work would have afforded in the past, and would continue to afford in the future, a considerable number of young Irish architects a very suitable field for employment, with advantage, he was sure, to the ratepayers and the occupants alike. But what were the facts? He could imagine no stronger argument for "Statutory Enrolment," "Registration," call it what they would, than the state of affairs in that particular, for but a small minority of the Councils retained as architects men with any semblance of qualification. Some of the men engaged in that responsible work, involving such large outlay and such great moral responsibility, were utterly unfitted for their positions; some had never superintended the putting of one stone upon another. Some were men who had done a little bit of speculative building on their own account; some were tradesmen who had never made, and occasionally could hardly read, a plan; others were county surveyors' assistants in remote districts, whose principal previous technical experience had been road mending. There were worse cases, but there were one or two gentlemen in the room who could bear him out that he was not exaggerating. The Local Government Board declared they had no power to stop the system of the miraculous creation of architects and engineers; usually the appointments were tendered for, and invariably gained by personal influence, the successful competitor being, by a stroke of the chairman's pen, invested with the magic degree of "architect and civil engineer to the Ballymuck Rural District Council," and then he blossoms forth into private practice. The result was often ill-designed and carelessly or incompetently superintended work, and in addition qualified architects were robbed of legitimate sources of livelihood. The same or a worse state of things prevailed in many districts as regarded the contractors. Men of the most incompetent type were readily employed, so long as they had sureties and tendered at a low figure. In the more remote districts it was impossible to attract a respectable class of contractor, and the work fell to men who had never before built a house, seen a plan or had the remotest idea of the value of work, or how to set-out or construct it; their estimating was evolved by a process of combined intuition and sportsmanlike pluck. They knew a similar cottage was built in such and such a place, and tendered a few pounds more or less. Occasionally those men were thoroughly dishonest, unscrupulous to the last degree, and a book might be written of the laughable blunders, the extreme and low cunning that some of them displayed. They were employed sometimes because none others could be obtained, sometimes after the other tenders had been on three or four successive occasions rejected as too high. To meet with a couple of really "bad eggs" on a scheme was enough to turn an architect's hair grey, for no amount of supervision could produce good work from such men. They were neither able nor willing to do their work honestly or decently. So much for the seamy side. On the other hand, he had personally, in the districts that he had had experience of, invariably met with courtesy and consideration from the Councils. He had found them ready and willing to pay a professional fee, and kind and considerate clients, ready to pay a competent contractor a fair price, and appreciative of good work. The contractors he had met had, almost without exception, done their work faithfully and well and given little trouble, and he had the pleasantest recollections of his dealings with them; but he feared he had been exceptionally lucky, probably owing to the fact that the work was not so very remote or scattered, as was often the case. Now as to a remedy. As regards the architects, "Registration" in some form or other was the only real solution; but the Local Government Board ought to be empowered to refuse to consider any scheme not signed by an architect of at least some experience. He did not propose that every man should be a Norman Shaw, or even a member of the Institute, but some standard should be set up. Millions of public money was involved, and he felt convinced that a firm remonstrance, or even friendly advice, if it went no further, from the Local Government Board as to the necessity of employing competent men, would in most cases be productive of good. As to bad contractors, he could only suggest as a remedy the more frequent grouping of cottages. That would tend to economy, and at the same time attract better contractors, while men notoriously guilty of fraudulent practices in their contracts should be "starred" and excluded from ever again tendering for work under a district council, and a list of such men should be supplied to the Local Government Board for the use of their auditor. Before finishing, he might touch on the clerk of works. Very few Councils employed them in addition to an architect. The good clerk of works who brought to bear skill, energy and honesty upon his duties was rare, and a jewel beyond price. The architect in charge of a big labourers' scheme who was blessed with the help of such a man had much to be thankful for. The great work of the last twenty-three years—the housing of the rural labourer—had been little talked about, but it was one that Ireland had reason to be very proud of. While rural England was being rapidly depopulated, they in Ireland had accomplished so much. They never hear much of it, but it had done more than anything else to combat the awful drain of emigration. Since the passing of the Act there had been authorised close on 27,000 labourers' cottages, each with its little plot of land, and capable of accommodating in modest comfort, he should say, an average of not less than five persons per house, or, say, 121,000 to 125,000 souls—a small number in comparison with the total population of a nation, but large when we consider the objects achieved and the difficulties that lay in the way.

DISCOVERY IN EGYPT.



A CORRESPONDENT of the *Glasgow Herald*, writing from Luxor on February 7, says:—I have just returned from Der el Bahri (Thebes), after witnessing the discovery of a unique monument of ancient Egypt. It is a shrine of the eighteenth dynasty, devoted to the worship of the cow-goddess Hathor, and so far as yet known, no other example of the kind has been found in Egypt. Professor Edouard Naville, of Geneva University, has been in charge of the excavations conducted for several years past by the Egypt Exploration Fund at Der el Bahri, on the west bank of the Nile opposite Luxor. For two seasons he and his party have been excavating a pyramid-temple of Menthuhotep, a king of the eleventh dynasty, (date (2832-86 B.C.), the oldest temple in Thebes, and have already discovered some most interesting remains of that period, the principal of which are retained in Cairo Museum, and others have been sent to the British Museum. But all the "finds" have been eclipsed in importance by the discovery of this afternoon. M. Naville had kindly invited myself and my wife to see the excavations, and about half-past two in the afternoon, while he was explaining to me the relation of the northern part of the pyramid-temple to the great temple of Der el Bahri, a native overseer came up to him and whispered something. We followed the overseer to the back or western portion of the diggings, that which lies against the hillside, and he pointed out to us a segment of an archway that had disclosed itself as the débris fell away from the slope. There was just enough of a gap left for us to creep in, and the excitement was intense. The whole multitude of workers, men and boys, stood still, and by-and-by crowded up round us as we disappeared within the hole, and the ladies of the party, Madame Naville included, watched from a little distance. The chamber proved to be about 6 or 6½ feet long, about 6 feet high, with arched roof, and contained a life-size cow-goddess, in limestone, with the sun disc between her horns. No other object of the kind has been found in Egypt. A hasty examination of the walls, which were beautifully painted in colours, followed. On both sides a cow is represented, that on the left-hand wall suckling the king, and on the back wall are the titles and cartouches of King Thothmes III. (date, 1503-1449 B.C.) (Men-Kheperra) (Jehutimes—Divine Ruler). The latter, Divine Ruler, within the cartouche, is a peculiar combination. The other officers of the Fund and the ladies present had a peep at the beauty of the chamber, and the opening was then promptly boarded up, in order to have the whole surroundings properly cleared and to prevent the débris of the surrounding slope from falling in, as well as to exclude predatory visitors. M. Naville and the Egypt Exploration Fund are to be congratulated on this unique discovery, which it is hoped will stimulate further interest in the Fund's work, for which subscriptions are much needed.

Mr. B. J. Tench, of Cambridge, has obtained the first prize of 100*l.* in the competition for the offices for the Norfolk County Council.

R.I.B.A. Election of Fellows, March 5, 1906.

SIR,—In compliance with requisitions in writing duly signed according to the provisions of by-law 9, the election of the twenty-eight candidates for Fellowship nominated by the Council for election at the business meeting on March 5 will be taken by voting papers.

The Council are aware that these requisitions proceed from a widespread feeling that the Institute should avail itself of the permission granted by clause 3 of the charter to declare that every person desiring to be admitted a Fellow shall be required to have passed such examination or examinations as may be directed by the Royal Institute.

Sympathising with this feeling the Council adopted it as their policy in 1904, and at a special general meeting held on February 29, 1904, a resolution was passed to the effect that after December 31, 1906, no person shall be admitted a Fellow unless he is either an Associate or has passed the examination or examinations qualifying him as an Associate. On the same evening, however, the general body passed the following resolution of the Royal Institute:—

"That during the intervening period (*i.e.* till November 31, 1906) every architect eligible under the charter for election who desires to join the Institute as a Fellow be encouraged to do so."

In consequence of these resolutions becoming generally known in the profession a large number of eligible candidates have come forward during the last two years. The Council are convinced that it is to the interests of the Institute that thoroughly qualified architects in various parts of the country whose age and busy practice preclude from entering for examinations should become Fellows before the door is for ever closed against them.

At the same time the Council has subjected the qualifications of candidates during the last two years to the same careful scrutiny and inquiry as has been their practice during the whole existence of the Institute.

To avoid any possible misapprehension the Council declare that the last election of Fellows under the existing system will be on December 3, 1906.

In view of the requisitions for a poll the Council think it right that members should be reminded of the above facts, and as one adverse vote in four excludes, they desire to direct the attention of members to the gravity of their responsibility when they fill up their voting papers.—We are, sir, your obedient servants,

ALEXANDER GRAHAM, hon. secretary.
W. J. LOCKE, secretary.

Royal Institute of British Architects,
9 Conduit Street, London, W.:
February 21, 1906.

R.I.B.A. Fellowship.

SIR,—The sympathy of all right-minded members of the Institute can hardly fail to be extended to the indignant feelings of your correspondent, Mr. Musto, at the manner in which elections to the Fellowship are at present being pushed through. There can be no doubt that the best chance under the present régime of attaining the position of F.R.I.B.A. is held by those who are the least known. The man of whom nobody knows either good or bad has only to induce three Fellows to sign his nomination paper, not a difficult matter apparently, and send in a few drawings and photographs of buildings designed by himself, or by a "ghost," and he will be "found by the Council to be eligible and qualified for membership according to the charter and by-laws, and recommended by them for election." He may have tried to pass the examination and failed; that is no bar to the Fellowship.

Part of the blame for the present state of affairs is ascribed to ordinary members who do not take the trouble to acquaint the Council with what they know of men proposed; but in the face of the treatment meted out to the allied societies by the Council, the private individual member is hardly likely to court an inevitable snub.—I am, &c.,

A LONDON MEMBER.

Saxon Snell Prize.

SIR,—Many of your readers will, I think, be interested in having particulars of the Saxon Snell Prize. This prize was founded to encourage improvements in the construction or adaptation of sanitary appliances, and is to be awarded by the Council of the Royal Sanitary Institute at intervals of three years, the funds being provided by a legacy bequeathed to the Institute for this purpose by the late Henry Saxon Snell, F.R.I.B.A. The prize consists of 50*l.* and a medal of the Institute, and is offered in the year 1906 for an essay on "Suggestions for improvements in sanitary appliances for use in workmen's dwellings and labourers' cottages under the varying conditions of water supply and drainage usually obtaining in towns and villages."—Yours faithfully,

E. WHITE WALLIS, Secretary.

The Royal Sanitary Institute,
Margaret Street, London, W.:
February 21, 1906.

GENERAL.

Sir Edwin Cornwall, L.C.C., M.P., stated recently:—"The embellishment of London is a civil duty, but it cannot be fulfilled until we give art a larger share in our education. We want, in fact, to breed a race of Londoners not only proud of the beauty of their city, but anxious to enhance it."

The Manor-House of St. Nicholas, at Wade, near Birchington, the residence of Captain G. M. Smith, was destroyed by fire on Monday. The mansion, which was a new one, costing about 10,000*l.* to build, was filled with very valuable furniture, the total loss being estimated at not far short of 20,000*l.* The outbreak is said to have been caused by the overheating of an incubator.

Mr. C. R. S. Kirkpatrick, city engineer of Newcastle-on-Tyne, has prepared a scheme for a new street from Market Street to Trafalgar Street. The land to be purchased for the new street will cost about 431,000*l.* in all. The engineer estimates that the surplus land for sale after the new street is made will realise about 601,820*l.*, which, after deducting 22,000*l.* for street formation and 25,000*l.* for other expenses, will leave a profit of 123,000*l.*

Mr. F. R. Kempson, of Cardiff, has been appointed diocesan architect for Llandaff in the place of the late Mr. John P. Seddon.

No. 33 Foley Street, Oxford Street, W., has been demolished. This was the house where Edwin Landseer was born and lived until he was twenty-four years of age, leaving it in 1825. At the age of thirteen Landseer painted his first Academy picture, which, when exhibited, was labelled "Master Edwin Landseer, 33 Foley Street."

The Northumberland and Durham Provincial Committee of the Surveyors' Institute held a meeting at the Mining Institute, Newcastle-on-Tyne, on Saturday. Mr. Eade, the chairman, announced that the Council of the Institute had decided to offer three scholarships of 50*l.* a year each, tenable for three years at the Armstrong College, Newcastle.

The Chester Archæological Society at their last meeting inquired into the veracity of the generally-accepted notion that the noble house of Grosvenor derives descent from Hugh Lupus, Earl of Chester. Mr. W. Fergusson Irvine, F.S.A., incidentally referred to an ancient document as being of special importance, as it assisted in elucidating the early stages of the pedigree of the Grosvenor family, "and drives one more nail into the coffin of that ancient and highly respectable myth, the descent of the Grosvenors from Hugh Lupus." According to Burke, Gilbert le Grosvenator, the supposed founder of the English Grosvenors, came over in the train of the Conqueror. But on the authority of the visitation of the county of Warwick (1619) he is said to have been Hugh Lupus's nephew.

M. Ferdinand Dutert, the French architect, who died last week in Paris, was in his sixtieth year. He was honorary architect of civil buildings and honorary inspector-general of the teaching of design. Among his works were the immense gallery for machinery in the Exhibition of 1889.

The Holborn Borough Council resolved last week that not more than six architects be selected to submit preliminary plans for the new municipal offices, and that they be paid an honorarium of 20 guineas each; that they be furnished with plans of the site and of the existing buildings; that in the consideration of the plans preference be given by the establishment committee to those showing an economical use of the land; that the committee be empowered to consider the plans when received, and submit a further proposition upon the matter.

Mr. G. E. Smith, architect, Portsmouth, has been awarded the first premium in a competition for a Wesleyan church at Freemantle, Southampton.

The Architect.

THE WEEK.

By the regulations of the Society of French Artists architectural drawings intended for this year's Salon are to be sent in on April 4 and 5. Each exhibitor is not allowed to have more than two works, but there may be several drawings of each work. Designs which have been prepared for competitions in architectural schools are only admissible in exceptional cases. Photographs may be admitted, but only as giving information respecting a building. Models in relief are also eligible, either as one of the two works or as complementary information. The jury who will examine the drawings will consist of thirty-six architects who are elected for a period of three years. The award of the medal of honour will be voted by architects who have received similar medals together with the jury. Other awards will be accorded by the jury alone. The number of medals will be limited to twelve. Architects who have obtained already the medal of honour or a first medal cannot compete.

THE Carriers' Act is almost as comprehensive as the business to which it relates. It is not merely men of the PEERYBINGLE species with a van on a public road, but railway companies, wharfingers, and, in fact, anybody who undertakes to convey goods from one place to another. By one of the clauses of the Act a carrier is not liable for the loss of any parcel which exceeds 10*l.* in value, unless that value has been declared, when the carrier can demand an increased charge. This circumstance should be realised by artists and others who send valuable pictures to exhibitions. A case was tried in the City of London Court on Friday last which revealed the extent of liability. Mr. GROSVENOR THOMAS, the painter, sent last year to the Münich Exhibition a picture of which the value was said to be 2,800*l.* It was damaged while passing through one of the entrances of the London and India Docks Company. For the defendants it was pleaded that they were exempt from liability, as plaintiff had not declared the value of the painting. Plaintiff's counsel, on the other hand, argued that dock companies were not common carriers, and the failure to declare value did not affect the case. Judge RENTOUL, however, found that the company were common carriers, and judgment was given for them with costs.

THERE must be more than meets the eye of an ordinary observer in the desire of the Building Act committee of the London County Council to alter the arrangements respecting district surveyors. When the proposal was brought forward the finance committee opposed it, on the ground that instead of the change bringing profit it would entail a loss. On January 30 the Council referred back the subject for further consideration, and on Tuesday last a like course was again adopted. In their latest report the Building Act committee state that all they sought was approval of the general principle of payment of the district surveyors by salaries. It is further said that whether the Council decides to pay district surveyors by salaries or not, the prohibition of private practice makes it necessary to rearrange districts so as to provide in every case an income sufficient to attract competent candidates for the office of district surveyor, and in this connection it should be noted that the order of reference to the Building Act committee provides that the districts are to be rearranged by the committee as opportunities occur, so that the average of the fees received may in no case amount to less than 500*l.* per annum. Delay in introducing payment by salaries will, so far as can be seen, result in increased cost, and there is support for this opinion by the fact that, while in 1890 the cost would have been 40,638*l.*, the cost had risen in 1905 to 50,748*l.* There are now eight districts vacant, two districts where the district surveyors are not acting owing to ill-health (one is mentally weak), and six districts where the surveyors are over seventy years of age, so that the present time is an exceptionally favourable one for the introduction of a new system of payment. Mr. HOWELL WILLIAMS considered that the change would lead to an enormous increase in expenditure, and Sir R. M. BEACHCROFT declared that under the proposed system the district surveyors would be less eager to collect the fees. But that duty need not belong to the surveyors. Collectors at a much lower salary could be employed for the purpose, the district surveyor's duty being confined to a return of the services he rendered.

THE establishment committee of the London County Council have again considered how the additional work in the architect's department, consequent on the last amendment of the London Building Act, is to be carried out. It is considered that the most satisfactory arrangement would be to amalgamate the work of providing means of escape in case of fire, now dealt with in two sections of the architect's department. In this manner the work would be concentrated. The new work would then be in the hands of experienced officials who have for years been trained in business somewhat akin in character, rather than by a staff of entirely new officials. It is accordingly suggested that the number of principal assistants in the architect's department be increased by one, and that Mr. C. J. T. DADD be promoted to the position of principal assistant at the commencing salary of 400*l.*, rising to 450*l.* a year; that the salary of Mr. J. TODD be increased from 350*l.* to 375*l.*, and ultimately to 400*l.* a year; that Mr. G. S. TURNER be promoted out of the first class to the position of senior assistant at the commencing salary of 300*l.*, rising to 350*l.* a year by two annual increments of 25*l.* It is proposed that four additional assistants in the first class be appointed in the architect's department, who will be taken from the unestablished staff. Three other assistants who are already employed will be promoted. By the arrangement there will only be an opening for a fourth-class clerk in the architect's department.

THE case of LEWIS & SALOME *v.* Charing Cross, Euston and Hampstead Railway Company decides an important question as to the rights of adjoining owners under the London Building Act, 1894. The defendant company took by agreement (they could not acquire compulsorily) No. 21 Cranbourne Street. They then proceeded to demolish the house in order that they might make use of the site as a station. The plaintiff was the lessee of the adjoining house (No. 22). He alleged that this demolition affected the party wall between Nos. 21 and 22, and claimed that, as the company had not given the notices required in such a case by the London Building Act, 1894, they should be restrained from continuing the work of demolition. The company, on the other hand, argued that premises used for the purposes of a station were exempted from Parts 6 and 7 of the Act relating to the construction of buildings, and were exempted by a section of their special Act from any provision of any Act relating to buildings in the Metropolis. WARRINGTON, J., held, however, that the company thus taking land by agreement were only exempt from the provisions of the parts of the London Building Act relating to construction, but that they were not exempt from Part 8 of the Act, which relates to the rights of adjoining owners; so that if they wanted to demolish a building thus acquired they were in the position of any other owner "desirous of doing a work affecting" a party wall, and must give the required notice.

THE PROPOSED EXHIBITION OF SCULPTURE.

THE London County Council may be considered as fortunate in receiving the petition of the Society of British Sculptors for facilities to hold an exhibition of British sculpture which was executed during the last quarter of a century. In the first place the exhibition, if held in Aldwych or Kingsway, would have the effect of making the vacant ground which has cost so much money better known to the public, and of suggesting that the new roadways are as well adapted for holding exhibitions as Piccadilly or Regent Street. Halls for Salvation Army congresses and the like may have their use, but they do not give rise to associations which enhance the value of the ground on which they stand. An exhibition of art, although only of a temporary character, creates a very different impression.

The exhibition would also suggest a remarkable fact in the history of English art. British artists know that they must not look to the Government either for protection or for support. Whatever may be the predominant party it agrees in that respect with that which preceded it and those which are to follow. In all other countries the case is different. No doubt it is not altogether a disadvantage that with us the arts are free from official interference. The men who form the Government in successive ministries are rarely known as patrons or purchasers of the works of their countrymen. It was said during his lifetime, and has been repeated since, that the second Sir ROBERT PEEL, who was so long Premier, would be an ideal Minister of Fine Arts. It is true he purchased pictures, but they were produced by deceased masters of foreign schools. He was no doubt kind to HAYDON in later life, but it did not go so far as obtaining one of that unhappy artist's pictures. When we find that no Government has the courage to give a commission for completing the few mosaics in St. Stephen's Hall, we can infer what little chance there is for the acquirement of pictures or statues by English artists.

Yet it is agreed that public commissions have had generally the effect of inspiring artists to higher aims. For a man is likely to endeavour to surpass himself when he remembers that his work will always be preserved instead of being transferred from owner to owner through the agency of the auction room. If English artists are ever to have that satisfaction it will be owing to the influence of county councils or other corporations, and as the chief representative of those bodies the London Council can do much. For the moment there can be nothing better than the holding of such an exhibition as is proposed. The experiment has, moreover, peculiar interest.

Unless we are greatly mistaken it will hereafter be recognised that during the period contemplated there has been one of those mysterious movements in the art of sculpture which it is no exaggeration to call phenomenal. Historians will hereafter differ about its origin, and several causes may be assigned to explain the effects, but the fact remains that during the last five-and-twenty or thirty years work has been produced which differs in character from the sculptor's work of forty or fifty years ago. In arranging such an exhibition it is difficult to be rigidly definite. But we consider there would be a loss of one influence which would be explanatory if some casts of the work of ALFRED STEVENS were not allowed to have a prominent place. He died in 1875, but he was as much in keeping with the modern English style as any sculptor now living. We must remember that STEVENS's originality was resented, and that if he had adopted the stereotyped treatment which was then approved he would have been financially successful. A man so versatile could have gained a fortune, but he preferred to express new ideas although involving slow martyrdom to himself.

The Society of British Sculptors can be trusted to select representative examples of the art. We hope, however, they will not be indifferent to those which embellish buildings. They may not be as numerous as is desirable, but among the characteristics of modern efforts are qualities which are allied to those demanded by architectural sculpture. Repose, variety of contour, symmetry, recognition of material which we see in figures and groups are adapted to harmonise with buildings. The peculiar decorative character is sometimes suggested on a small scale when pedestals, like those employed by the late ONSLOW FORD, are used to support statuettes, and which are designed to correspond with the figures instead of being copied from commonplace compounds which could be produced by machines. Architectural sculpture in this country has had for a long period many prejudices against its use. In the old castles the art was not required. For, as FLAXMAN says, if the walls were sufficiently strong to resist battery or shot, and contained retreats to secure the inmates from danger, their purpose was attained. When in more peaceful times architectural art required balanced compositions in painting and sculpture, foreigners alone were employed. No other country in the world offered so many commissions to strangers, both sculptors and painters, as England from the time of CHARLES I. to GEORGE I. To make matters worse neither the painters nor the sculptors were of the highest class, and thus examples were placed before English artists which were better adapted for avoidance than for imitation.

Brief as is the period which is to be exemplified, we suppose it will be necessary to comprise works by artists who are no longer in this world. An exhibition of modern sculpture from which the few works of Lord LEIGHTON were excluded would lose much of its significance. His figures are not to be taken as evidence of a belief on his part that he could if he liked be as successful in sculpture as in painting. When he said that Greek sculpture mirrored at its best the mind of Greece, he expressed a truth which could be extended, for sculpture in other countries was also expressive of national characteristics. Perhaps it will some day be accepted that as in the Elizabethan age the English mind was mirrored in the drama, at the close of the nineteenth century sculpture expressed the finest qualities of the English mind. LEIGHTON'S sculpture does not correspond with his paintings. But it suggested that it was not necessary to employ gods and goddesses in order to express the power of the art. ONSLOW FORD showed his competence in most classes of sculpture, and in that way he must be reckoned as one of our principal masters. He was trained in foreign studios, and therefore it cannot be said of him that he carried on English traditions. His works do not recall any of his predecessors in the Academy. The members who believed they were following Classic precedents would have been aghast at seeing so much attention bestowed on the trappings of the camel which bears GORDON. But by no other means could the services of the soldier in Africa be suggested. What must be regretted is that the capability of ONSLOW FORD to produce exquisite statuettes was not recognised by those who professed to be art manufacturers. For if reproductions of his works were as obtainable as those of French sculptors, there can be no doubt that the art would be as much appreciated in England as in France. It is not to the public statues in the streets that Parisians owe all their liking for sculpture. The statuettes in the windows of the bronzists also exercise an influence which deserves to be recognised.

Another sculptor whose works would be attractive was the late HARRY BATES. He could not resist the old glamour of Greece. But he treated classical subjects as he imagined them, and not as austere precedents dictated. His *Homer* is recognised as his most important work. But it should be remembered that he had not reached his fortieth year at his death, and if

Digitized by Google

he had lived there is no doubt that he would have enriched his country with still nobler masterpieces.

We need not refer to living sculptors. On them we must rely, and it is no exaggeration to say that some among them are competent to produce works of which the reputation will not be confined to the present time. But the structure which will be employed for the exhibition of the collection will have to be very different from any now in use if justice is to be done to the artists. Long lines of statues and busts standing on boards covered with red baize may surprise for the moment, but soon become tiresome to the spectator. The members of the Society will no doubt be able to offer suggestions. But our love of regularity and mechanical disposition have long made sculpture suffer in public esteem. What is desirable is an arrangement like that sometimes adopted in Paris, by which the works shown are enhanced by draperies, vegetation and other auxiliaries, to relieve the eye from the excess of white.

SCOTTISH SCHOOLS.

WE are told by MACAULAY that FLETCHER of Saltoun, the Scottish patriot, was so disgusted by the ignorance and lawlessness of his poorer countrymen, he proposed that many thousands of them should be sold as slaves. The overseers' whips could alone, he thought, reclaim them from their idle and predatory habits. Fortunately for Scotland such severe measures were never carried out. By order of WILLIAM III. a Parliament was held in Edinburgh in 1696, which, after declaring how prejudicial was the absence of schools in many places, decreed "that there be a school settled and established, and a schoolmaster appointed to every paroch not already provided, by advice of the heritors and ministers of the paroch." The school was to be a commodious house, and the master's salary was not to be less than 100 marks yearly (5*l.* 11*s.*) nor more than 200. The education which followed has, as MACAULAY says, "done more for the bleak and dreary shores of the Forth and the Clyde than the richest of soils and the most genial of climates had done for Capua and Tarentum."

The Act was compulsory in its enactments. But, as was to be expected, the school buildings varied in character according to the wealth of the parishes. HUGH MILLER describes the grammar school of Cromartie in which he was taught. He tells us that it was a "low, long, straw-thatched cottage, open from gable to gable, with a mud floor below and an unlathed roof above; and stretching along the naked rafters, which, when the master chanced to be absent for a few minutes gave noble exercise in climbing, there used frequently to lie a helm, or oar, or boat-hook, or even a foresail—the spoil of some hapless peat-boat from the opposite side of the Firth." If in a prosperous town like Cromartie the school was of so primitive a character, in rural districts a still humbler standard would serve. But a vast number of able men obtained their preliminary education in schools of the kind.

The days for such arrangements are now vanished. Scotland has its Education Department that will insist on uniformity in the arrangements of school buildings, and, what is no less remarkable, they will have to be constructed on similar principles to those adopted in England. The official rules which have just been issued are therefore deserving of some notice, although English architects are unlikely to receive commissions from the north—Scotchmen do not as a rule believe in reciprocity.

In Scotland, as in England, a quarter of an acre of site will be necessary for every 250 children. It is also stated that except in very small schools there should be separate playgrounds for boys and girls with separate entrances. Another English rule is that for large departments containing from 350 to 500 places there should be a central hall with the classrooms grouped round it. The Scottish rule relates to schools of 500 and upwards. A school with 350 places or more would therefore be considered a small school, and could have a wide corridor instead of a hall. In both countries the floor-space agreed on is $3\frac{1}{2}$ square feet for each scholar "likely to occupy it at one time, but not less than 1,000 square feet in all." The English rule is that a schoolroom should never be designed for more than 100 children. In Scotland the number is eighty children, and the width should not be less than 16 feet or more than 25 feet. As regards classrooms, the minimum size allowed in Scotland is 18 feet by 15 feet. The Scottish central halls are to have wood-block or similar flooring. The principal entrances should never be through the cloak-room or directly into the schoolroom or classroom. The number of lavatory basins is not defined in England, but in Scotland the proportion is one to every twenty-five scholars.

The Scotch rule as regards lighting is that any space beyond 25 feet from the window wall cannot be regarded as adequately lighted. The English rule is 24 feet. The sills of main lighting windows should in the north be placed about $3\frac{1}{2}$ feet and not more than 4 feet above the floor. Another rule is that "in each classroom the glass area should be from a quarter to one-fifth the area of the floor, and should not be less than one-sixth." It is also said that "the upper sashes should be hinged to fall inwards and form a hopper, with side cheeks for summer ventilation." Suitable blinds must be provided where necessary in Scottish schools. The steps of staircases in English schools should be about 13 inches broad; in Scotland each step is to be not less than 12 inches broad. In England the sizes of the inlets and outlets for ventilation are to be adapted to the method employed. The Scotch rule is that "inlets should provide a minimum of 6 square inches of net airway per child and outlets a minimum of 4 inches." The use of open grates is allowed in Scotland. They "should be of the ventilating pattern, having an air-chamber with fresh air inlet direct from the outside, and openings from same having regulating valves or sliding gratings for delivering the warmed air into the rooms. Proper means of access for the purpose of cleaning the air-chambers should be provided." In describing sanitary arrangements the Scotch rule is in favour of single closets of the wash-down pattern rather than the trough system. The number of closets required is generally less in Scotland. Soil-drains inside the building are not allowed in England. But where they are unavoidable in Scotland it is stated that they "should be constructed with heavy cast-iron pipes, carefully caulked and jointed with lead, and having concrete blocks under the faucets."

In English schools the usual length of the dual desk employed is 3 feet 4 inches. That length is to be used only for the higher standards in Scotland, with 3 feet for the lower standards and 2 feet 6 inches for the infants. It is also said:—"No desks should be more than 9 feet long. In a schoolroom providing for more than sixty children there should not be more than four rows of long desks or five rows of dual desks. In an ordinary classroom five rows of long desks or six rows of dual desks may be provided." In England an infants' classroom is not to accommodate more than sixty infants; in Scotland the number is to be fifty for classrooms and eighty for schoolrooms; the width is not to be less than 16 feet. There is no recognition in Scotland of a reduction to 9 square feet for infants. The 10 square feet of floor space is the minimum, and it is said that a larger area should be provided whenever practicable. Additional directions relating to drawing classrooms have been given, viz.:—"The whole available wall space of the room from a height of about 3 feet above the floor up to a height of about 7 feet from the floor should be covered with linoleum or have the surface suitably prepared for the purpose of chalk drawing. Where no special drawing classroom is provided, the walls of at

Digitized by Google

least one of the ordinary classrooms should be prepared as above described."

The rules relating to higher-grade schools in Scotland are more precise than those adopted for England. The classrooms are to be furnished with single or dual desks. Single desks should be 2 feet long, and where they are used an area of about 16 square feet per scholar is to be allowed. With dual desks the minimum will be 13 square feet. The laboratory accommodation must be sufficient to provide at one time for the largest class in the school. Generally there is to be one laboratory for chemistry and one for physics. But whenever the teaching staff is limited one room may serve for both. As 30 square feet of floor space should be afforded for each scholar the minimum size of a laboratory will therefore be 600 square feet. But it is desirable they should be larger. The laboratories are to be fitted with suitable tables, well lighted, and they should be properly supplied with gas and water. Sinks, cupboards and fume closets should be installed in chemical laboratories. A balance-room may be provided. Higher-grade schools may also have a lecture-room fitted with a demonstration table furnished with a gas and water-supply, with a sink as well as a fume closet. The lecture-room should have an area of about 750 square feet. If a separate lecture-room is not provided, the classrooms used by third and fourth-year scholars could be fitted with a simple demonstration table. "A drawing classroom for the more advanced drawing is desirable. It should provide 30 square feet of floor space for each scholar; the best size will be a room with an area of 750 square feet. If suitably lighted, the hall would answer for this purpose. The walls should have a portion of the surface prepared for chalk drawing." The rules for the teacher's house correspond with those of England, except that in Scotland a bath-room is necessary.

The Scotch Education Department announce that loans may be refused unless the whole cost of the school, exclusive of site, legal expenses, extra rooms and residence, is kept within the sum of 12*l.* per child. Additional allowances will be made for central hall, and rooms for drawing, chemistry, cooking, &c., varying from 15*s.* to 20*s.* per square foot, and for workshops from 10*s.* to 15*s.* a square foot. The cost of a master's house consisting of parlour, kitchen and three bedrooms is not to exceed 800*l.*, and the caretaker's house (which is to have parlour, kitchen and two bedrooms), 500*l.* It is also pointed out that all building contracts should contain a clause that no claim for extras will be even considered unless the work has been ordered in writing by the architect, and the order bears the counter-signature of the clerk of the school board.

The differences between the English and Scottish regulations are not to be ascribed to any peculiar conditions in either part of the country. The English rules appeared last July, while those relating to Scotland were issued a few weeks ago. We may therefore conclude that the Scottish rules are inspired by the additional experience of six or seven months in schools, and may be taken as the latest decrees of the education authorities. In a short time nobody would be surprised if similar changes became necessary in England.

The Additions erected for the use of students at the York School of Art have been completed. The rooms are in the old north galleries, which have had another storey added. On the ground floor there is a lecture room, elementary room, crafts room, architectural room, life modelling room, general modelling room and offices. On the upper floor is the antique room, painting room, studio and ladies' life classroom, and life classroom. By day the rooms are lighted by large plate-glass windows and at night by electricity. The work has been carried out from the designs of Mr. A. Creer, city architect.

SOME ILLUMINATED MANUSCRIPTS OF CONTINENTAL EUROPE.*

I PRINTED some years ago a lecture delivered by me at Cambridge, as Sandars Reader to the University, "On English Illuminated Manuscripts," based upon some volumes in my own library. I will now endeavour to treat similarly a selection from the same source of specimens of the art of miniature painting in continental Europe from the eleventh to the fifteenth century. My object is not so much to instruct as to exhibit. If it were conceivable that I could receive each and every one of my present audience in my library, and endeavour to inflame their curiosity in regard to the history of miniature painting in Europe, there are certain books that I should take down and turn over. I hope to treat my present audience in a similar manner, only that, instead of taking down the books themselves, I shall show on the magic-lantern screen specimen pages from those books, in the hope that even so meagre a sketch may arouse curiosity and a desire to pursue the subject further. In this connection I should mention that Dr. Warner, the eminent head of the Manuscript Department at the British Museum, has recently rearranged the exhibited manuscripts in such a way that the passer-by may see a series of fine specimens in sequence of countries, beginning with the Byzantine manuscripts on the left, as you enter, and passing on by English, French, Flemish and Italian, till, at the end of the room, you have seen something considerable in illustration of all the great European schools of miniature painting.

Like Dr. Warner, I propose to begin with a Byzantine manuscript, written and painted at Constantinople in the eleventh century, when Byzantine art reached its highest perfection. I will next show you, by a few specimens, how, in the twelfth century, not without Byzantine influence, new schools of painting rose in Italy, Germany and France. After that we will concentrate our attention on France, the real centre and home of the art during the thirteenth, fourteenth and fifteenth centuries, and I will show you how, in that delightful country, successive kings and queens, warriors and bishops, abbesses and princesses, however much they fought among themselves on other questions, all united in one common belief, namely, that no pains were too great, no sum of money too vast, to expend on the acquisition of first-rate books of illuminated manuscripts.

Let us then open the first page of the heavy quarto volume which, written in the eleventh century, the time of our Conqueror, Duke William of Normandy, after having for many generations been the book from which the lessons were read by some Greek priest in a Constantinople church, found its way into the library of the Duke of Hamilton, and thence, by purchase of the German Museum, to Berlin, in 1882. Happily the German Government was seized with a fit of economy, and, under the influence of Prince Bismarck, who had no soul for illuminated manuscripts, and thought they had spent too much money on the Hamilton Palace books, they dumped this invaluable volume and several others on the London market, with the result that it now has taken its place among my hundred best manuscripts.

All the pictures I have shown you from this Greek manuscript display what I call the Persian carpet style of decoration, abounding in cobalt blue, I suppose because lapis-lazuli from which it was produced was common and cheaper in Eastern than in Western Europe. Witness my next slide taken from a real Persian manuscript in my collection of the year 1410, and written at Shiraz or Ispahan. Did the Persian artist derive from Constantinople? Or did both Byzantine and Persian derive from some still earlier development of Asiatic art? I think it is not unsafe to conclude that the Byzantine figure drawing was of classical origin, while the ornamental frames by which the pictures were surrounded were in the main inspired from the East. From whatever sources their style was derived, there is no doubt but that Byzantine art exercised a strong influence over the rising schools of Germany, Italy and France.

Remembering that the Greek gospel-book which you have just examined was of the eleventh century, and that Byzantine art had been in a state of continuous, though often interrupted, development during the preceding five or six centuries, and that some, at all events, of their books and other artistic productions had strayed over into the semi-barbarous countries of Western Europe, let us see what Germany, Italy and France were doing in the period

* A paper by Mr. H. Yates Thompson, F.S.A., read before the Applied Art Section of the Society of Arts on Tuesday, February 20.

Digitized by Google

immediately following. Deep in the forest wilds of Bavaria is the ancient monastery of Ottenbeuern. Here, in the twelfth century, the monk, Rheinfried, wrote for his abbot, or perhaps for his patron, Alexander, a "Collectarius," or collection of prayers, and thoughtfully put in for our benefit a portrait of himself, holding the book in his hand.

But while Rheinfried was working away in his rude manner at the Collectarius for the monastery of Ottenbeuern, what was going on at a more famous monastery in South Italy, that of Monte Cassino? Here the pains and industrious art of the Benedictines raised up a school of book decoration which, beginning in the days of Justinian, reached its climax of artistic excellence about this time. For its figures this Monte Cassino school owed everything to Constantinople, but its ornamental work is a new development. Unfortunately I cannot show you any of their figure drawing. Out of Italy, indeed out of the Monte Cassino library, these books are so rare that I believe my volume is almost the only specimen in England, and from it the figure picture, probably of the Crucifixion, has been, sad to say, extracted by some inconsiderate person.

We now reach the rich distinctive period of French miniature painting. Nearly two hundred years have passed away, years of steady development, and we now come to the great Antiphonary of the convent of Beau Pré, six giant volumes, which for near three hundred years lay, three on either side of the chancel, in the convent of the nunnery, the alternate verses of psalm and anthem rising in turn to the groined roof, and subsequently doubtless to the Heaven above. These books, six in number, came somehow to London about thirty years ago. Three of them were sold at Sotheby's, and the buyer was Professor Ruskin. From his estate they have lately passed into my library. Mr. Ruskin asked the auctioneer where the other three were; he was told they had been burnt in a recent fire. The three that remained, our three, were among the greatest treasures of Brantwood. But Mr. Ruskin with all his skill and enthusiasm never discovered where the convent of Beau Pré was. And this was no wonder, for there were scores of convents of the name of Beau Pré. I will now explain the chain of evidence by which the book has revealed its origin.

I should premise that this Antiphonary is unique among books of the sort, in that the first page, in a contemporary hand, tells us (1) the name of the convent, "De Bello Prato," or Beau Pré, and (2) the date of the book, 1290. The whole inscription is pleasing:—

> Liber ecclesie beate Marie de Bello Prato,
> qui scriptus fuit anno ab incarnatione Domini
> millesimo ducentesimo nonagesimo.
> Si quis illum abstulerit, anathema sit.
> Si quis illum fideliter et honeste tractaverit et
> servaverit, benedictus sit. Amen.

Let us hope the present and all future owners may merit the blessing and not the curse.

But this does not carry us in the history of the book beyond the certainty of the date and the name of Beau Pré. The next page gives the opening of the service, and in the margin are two little figures with names inscribed "Domicella de Viana" and "Clementia." And this is the page that reveals the secret. Who was the Domicella de Viana and who was Clementia? We set to work to discover among all the Beau Pré convents one which should be connected with a place named Viana. What was my delight when I found in East Flanders, on an old map, not far from Ghent, and two or three miles from Gherartsberg, or Grammont, a convent of Beau Pré, and about five miles from it a village and château of Vianen. I at once wrote to Father Van den Gheyn, the excellent chief of the manuscript department in the royal library at Brussels, to ask him if he knew anything of the convent of Beau Pré and of the lady of Vianen. In reply I learned that this convent of Beau Pré, of the Order of St. Bernard, was founded in 1228, and was occupied by Cistercian nuns till 1795, when the French Republic came down upon them, drove out the nuns and sold the convent and its lands by public auction. The "Domicella de Viana" was a certain Marie de Bornaing, wife of the Seigneur of Vianen, a little country town near Beau Pré, whose family is recorded as having been benefactors of the convent on many occasions, especially making frequent presents of firewood, and there is no moral doubt but that this Marie is the lady who gave them this splendid Antiphonary, as the text says, "Pour Dieu et en aumosne à l'Abbaye." Marie de Bornaing, or De Viana, had also a niece, named Clementia. What is further most remarkable about the books is that they are illuminated in the highest style of the art of the period — probably in one of the neighbouring towns, Courtrai, Arras, or Douai. I have inquired in Brussels, Paris and the British Museum, and I can find no French Antiphonary of this great size, of any period, so finely illuminated.

So delighted was I by these discoveries that I made an expedition to Grammont, this country town of East Flanders, about two hours railway journey from Brussels, and drove out to Beau Pré, two or three miles, to see for myself the first home of my Antiphonary. An old white Flemish mare took us in a rural brougham along a causeway with green fields and poplars on either side, and deposited us safely at the convent gate. For strange to say in the whirligig of time the convent, after being owned by Cistercian nuns for 550 years, and by a private family for 109 years, became last year a convent again. A party of some thirty Sœurs de Nazareth from Montmirail in France early last year, being turned out of their French home by the legislation of the present French Republic, had taken refuge in Beau Pré, having bought the house and grounds a few months before our visit. The lady superior was charmed to hear something of her holy predecessors and their Antiphonary, and showed us most kindly all there was to see. We found no vestige left of the old thirteenth-century nunnery except some wells and half a tombstone, engraved with the effigy of half an abbess. The original building had all been destroyed by fire in the seventeenth century, and now but for the well heads and the fragment of the abbess's tomb, the only remnant of the old foundation of 1228 is the Antiphonary which we are discussing.

Finally, we have a portrait of the monk, Johannes, who wrote some portion at all events of the Antiphonary. It is not at all improbable that this Johannes was identical with a certain Johannes of Cambron, the mother house of the Beau Pré convent, and situated only sixteen miles away, for we find his name and address as the writer of a volume now at the British Museum; but this requires verification. If it be so, we have in this Antiphonary a most unusual and delightful series of particulars and portraits, including the date of 1290, the name and likeness of the donor and her niece, those of the abbess and her nuns, and finally of the scribe who wrote, at all events, the third volume. I wish we had also that of the artist, especially of the comic painter who adorned many of the pages with little caricatures, most of which have unfortunately been expunged by some careful abbess who objected, I suppose, to any comic element being introduced in the serious Antiphonary. I give a specimen of one of these little scenes, that of a fish-stall in some French-Flemish town, spared possibly because the fish was a holy creature, the emblem of our Saviour, and the subject and means of many miracles, from the days of Tobias, Josiah and St. Peter, down to the time when St. Francis of Assisi, and St. Anthony of Padua, preached to the fishes. Anyhow, we have before us as realistic a scene of market life in the year 1290 as is to be found anywhere, and this is not surprising, for French Flanders, of all the countries of Western Europe, was perhaps the headquarters of the grotesque in miniature. The subject is so important that I shall show you a few examples of the art as seen in the adornment of another of my books, the "Verdun Breviary," a book produced probably not far from Metz, for Marguerite de Bar, the abbess of Verdun. The family of De Bar, a famous European ducal family in its day, connected with most of the royal houses, had for its arms two fish (the maigre or bar of the menus of the modern table d'hôte), and almost every capital in the Breviary has emblazoned within it either the arms of the lady's own family or those of England, France, Navarre, Evreux or some one of the great houses with which the noble abbess was connected. But the little scenes of Bible history, daily life or comic caricature, of which I shall now show some specimens, are the great distinction of the book.

We have seen something of the serious and comic art of the thirteenth century. Let us now dip for a moment into the fourteenth century, and turn over a few pages of a Prayer-book which was prepared for a queen, whom I have not yet been able to identify. Here she is depicted on the first page, coifed and crowned, with her Book of Hours lying on a stool before her, while her chaplain elevates the Host. This is the serious side of her religion. But the services were long and the Latin prayers tedious, and for her amusement she had little hunting scenes depicted at the bottom

Digitized by Google

of many pages. The lady was evidently fond of field sports, between twenty and thirty pages being devoted to her exploits in pursuit of rabbits, ducks, stags and wild boar. Not only did this anonymous queen delight in the sports of the field; she was also fond of little stories, of a more or less moral nature, in which figured knights and ladies, monsters and monks, princesses and magicians. One of these stories, quite a moral one, is illustrated by five pictures, and a little legend in red ink explains each of the five. Though the solemn prayers above are in Latin, the legend below is in intelligible French. The story tells of the adventures of Theophilus. This was a French legend of Eastern origin, and there were several versions of it. It is told in glass in the cathedral of Beauvais, and in stone at Paris in the tympanum of one of the doors of Notre-Dame.

We have glanced at two grand periods of miniature painting—that of the Byzantine predominance in the eleventh and twelfth century, and that of its early French development in the thirteenth century, with some of its characteristic serious and comic phases. I will now carry you on to the fifteenth century, when perspective began to be thoroughly understood, and the art of book illumination in France reached its highest point of artistic excellence. It is singular—when all is considered it is almost miraculous—that through all the wars of France, the Crusades and the civil commotions that raged throughout these stormy centuries, the delicious art of miniature painting went on undisturbed, sometimes in the quiet convents, sometimes in the studios of lay artists in Paris, Cambrai, Metz, Rouen and other towns of the provinces. Never was there a more troublous time than the first half of the fifteenth century. The Black Prince had sorely tormented them in the fourteenth century. But with the fifteenth came the still more terrible Henry V., the bloody conquest of France by the English, and the still more dreadful episode of the liberation of the territory, initiated by the Maid of Orleans, and finally effected by a group of French warriors, of whom naturally much less is said in our patriotic English histories. It is a strange circumstance that throughout the Hundred Years War the generals and admirals on both sides had the time and taste to acquire the most lovely books. The Duke of Bedford and Gloucester, the Admiral Coëtivy and the Bastard of Orleans, and what is still more surprising, the Earl of Shrewsbury, the renowned John Talbot, had exquisite Books of Hours, for which their affection was so great that they frequently carried them about with them to their sieges and pitched battles. I have four such in my library, and will show you pages from two or three of them.

Perhaps the most renowned of the commanders of the time was Jean Dunois, the Bastard of Orleans, not a bookish man, as his statue still preserved in his castle of Chateaudun shows him to us.

The little volume contains three portraits of the hero. In one he is praying to the Virgin; and it is from this contemporary picture that the well-known portrait by Montfaucon has been taken. I wonder sometimes that in a book belonging to so intimate a friend of Joan of Arc no notice or mention of her appears. But we must remember that poor Joan was burnt at the age of nineteen—surely the youngest woman who ever attained to so wide a fame—and the Bastard lived to a good old age and died in his bed full of honours. So perhaps he forgot how much he owed to the heroic maid, who now, after 500 years, is to be made St. Joan.

Dunois died a natural death, as I have said, but such was not the fate of John Talbot, first Earl of Shrewsbury, to whom my next volume belonged. He was killed in battle near Bordeaux, after a lifetime of campaigning, at the age of sixty-five. This book was prepared at Paris at the time of his second marriage, a similar volume being presented, very probably by the Regent Bedford, to his bride, Margaret Beauchamp, daughter of the Earl of Warwick. The books were made long and narrow for convenience of carriage on horseback, like pistols in a holster. The portraits of the bride and bridegroom (Talbot was about forty-five at the date of this, his second marriage), on the first page, represent them kneeling in prayer to the Virgin; their patron saints (St. George and St. Margaret) stand beside them, and the lower part of the page is covered with arms, mottoes, garter, &c., the borders being generally of marguerites or daisies in compliment to the name of the bride. The tradition is that this volume was picked up on the field of battle after Talbot's death. It certainly contains prayers of a special nature, promising safety to whomever has the book in his possession, and there is a pretty prayer, possibly in Talbot's writing, which runs as follows:—

Jesu, whom ye serve dayly
Upon your enemys giff you victorye
Of the holy crosse the vertu
Your gode fortune alway reneu
Oure Ladye and Saynt Gabryell
Geve you long lyffe and gode hele
And Saynt George the gode Knyght
Over your fomen geve you might
And holy Saynt Kateryne
To your beginnings send gode fyne
Saynt Christofre boteful on see and land
Joyfully make you see England.

The opening scene of Margaret's book is just like John's, but smaller and not quite so much battered, and the lower part is identical, except that the arms of the two families have been erased, probably by someone who became at some time improperly possessed of it. A careful scrutiny against the light shows that these also were identical. Margaret's book got into a convent in Luxembourg, the monastery of Epternach, in the seventeenth century, but we have no other trace of its adventures during the 470 years of its existence. The wonderful thing is that, after so many years of separation and wandering, these two wedding gifts, for that is what they probably were, should find themselves once more in one another's company on one of my bookshelves.

It has often been said that a very entertaining book might be written on the romance of book collecting. The adventures of the two Talbot Prayer-books, one lost on the battlefield of Castillon, the other long buried in a German convent library, and both happily reunited in the twentieth century, may seem extraordinary enough. But my next story, which is also the last with which I shall trouble you, is, I think, still more remarkable.

Just three years ago in Wellington Street, Strand, not 500 yards from this hall, there was exposed for sale among the ordinary victims of the auction-room a large square volume containing a manuscript of the early part of the fifteenth century. It contained in a French translation the second half of the well-known History of the Antiquities of the Jews by Flavius Josephus. It was bound in a solid red morocco binding of the eighteenth century, such as clothes in the British Museum many of the volumes which formerly belonged to Sir Robert Harley. It had one fine illuminated miniature at the beginning, and had had twelve pages, those at the beginning of each book of the history cut out with a sharp knife, cut out evidently in a hurry, for the wicked person who thus maltreated the book in his or her haste had cut in many cases the adjoining leaf as well as that which was to be extracted. Otherwise the manuscript was a well written book of the period and nothing more. There were, however, certain erasures, places where writing had been scratched out with a sharp instrument. Especially there was one such at the back of the sole surviving miniature, in which a trained eye could just detect a portion of the signature of John, Duc de Berri, the brother of King Charles V., the book-loving king of France, who founded the National Library of France. Now the Duc de Berri was perhaps the greatest bibliophile that France ever produced, not excepting the Duc d'Aumale himself, and I was familiar with his writing because he was always careful to write his name in his books, and I was already the possessor of three other volumes which had belonged to him. So I felt that the book was probably in some way or other remarkable; it was at all events interesting from its provenance, and I got a judicious friend to go and buy it for me at the auction, which he accomplished for a very moderate price. Imagine our joy when we got it home. The one picture, though damaged, was a stately production. King Herod, the *beau idéal* of a despot, has just entered the Holy City; followed by his knights and himself superbly mounted, he rides through ranks of slaughtered Jews, past the Piscina Probatica, the pool by the sheep market, in which are seen a number of sick people, and approaches the gate of the Temple enclosure. In the background is an altar for the restored worship of Jehovah. The twisted columns which enclose the altar are identical with those which Raphael subsequently introduced in his famous painting of St. John at the beautiful gate of the Temple, and which Jean Foucquet, the celebrated French painter, the head of the French primitifs, more than once represented in miniature, especially in the Book of Hours of Etienne Chevallier, which is one of the precious monuments of art preserved in the

Digitized by Google

magnificent Château of Chantilly, and for forty pages of which the Duc d'Aumale gave 10,000*l.* It subsequently formed part of his munificent gift to the French nation. The occurrence of these twisted columns in the Herod picture, as well as the general style of the drawing, made us think at once of Jean Foucquet as the possible painter. But the writing in our manuscript was nearly a century earlier than the date of Foucquet. How was this to be accounted for?

We next turned to the last page of our volume, where a good deal of writing had been obliterated. In the top right-hand corner were the final words of the book—we read, "Cy fine le livre de Josephe contenant en tout XXVII. livres historiaux." "Here ends the Book of Josephus, containing in all twenty-seven historiated books." A further inscription at the bottom of the page stated that in this—the second—volume there were thirteen illuminations. Now in my second volume, as a matter of fact, there was only one, that of King Herod. Twelve there remained to be accounted for in the second volume and somewhere or other there should be found the first volume with its fourteen pictures. Two conundrums were thus proposed to us. First, where was Vol. I.? Secondly, where were the twelve pages with their pictures which were missing in Vol. II.? The blank page where some writing had been obliterated revealed the mystery. You may know that there exists in chemistry a substance dear to book collectors, and known as hydro-sulphuret of ammonia. It is made available as a liquid, and with a camel-hair brush and a careful hand you moisten delicately the place on the vellum where writing has been scratched out, and then, as by magic, the erased writing reappears. In the present case two inscriptions came into plain view, which we can read on the photograph taken at the time, though in the three years that have elapsed since the photograph was taken they have almost disappeared again. The inscriptions run as follows:—The first is in the handwriting of the Duc de Berri, and says simply, "Ce livre est au Duc de Berri," and is signed "Jehan." The second, a little more difficult to read, is as follows:—"Et de presant à son fiz le Duc de Nemours, Comte de La Marck," and is signed "Jacques." Underneath is a further inscription which has not been erased, "Pour Carlat." Now these revived inscriptions tell us most of the history of the book. The first shows that it was written for the Duc de Berri, and as he died in 1417 it must have been written before that date. The second tells us that it belonged subsequently to Jacques d'Armagnac, who was beheaded by Louis XI. in 1477. Our next discovery was that the first volume of the book is in the National Library of France, and has at the end exactly similar inscriptions. But the revelations do not stop here. After the two inscriptions in Vol. I. occurs another inscription which does not occur in Vol. II., and which is in the handwriting of a certain François Robertet, secretary of Pierre de Beaujeu, Duc de Bourbon, and states that the first three miniatures (we are speaking of Vol. I.) were by the artist of the Duc de Berri, and the rest by the good painter and illuminator of King Louis XI., Jean Foucquet of Tours. It is therefore established that the whole book was written, and the first three paintings in Vol. I. made for the Duc de Berri; that the book then descended to his grandson, the Duc de Nemours, and was kept by him in his castle of Carlat (Carlat was on a high hill in the Department of Cantal, not far from Aurillac), that Jacques d'Armagnac had the paintings in the first volume, and presumably also in the second, completed by Jean Foucquet; that when Jacques d'Armagnac was besieged and made prisoner in Carlat by Louis XI., and executed in 1477, the book became the property of Louis XI., and when he died Vol. I. fell to his only daughter, Anne of France, and her husband, the Duc de Bourbon, whose secretary described it; that the second volume somehow got separated from the first and wandered to England, where after various vicissitudes it found its way into the library of Colonel Townley, at the end of the eighteenth century (whose book-plate is on the first page), and was sold at the sale of his library in 1814. In the catalogue of that sale, when it was sold for 43*l.*, it is stated to contain numerous miniatures. The twelve missing leaves therefore had plainly been abstracted subsequently to the year 1814, and one question only remained to be solved, where were those twelve pages now? I was sanguine enough to hope they might be found, and in an account which I printed of my little discoveries, I appealed to all librarians and collectors, in short to all the bookworms of the world, to look for them, and let me know in case they found them. Would you believe it, within two years Dr. Warner, of the British Museum, discovered ten of them in an album in the King's library at Windsor Castle. At the risk of tiring you to death, I have gone through this little history, and I conclude this paper with an appeal to my hearers, if ever they meet with two manuscript pages from the History of the Jews, one containing a large picture, and one a small one by Jean Foucquet, they will let me hear of them, and merit the thanks of all good bibliophiles.

INDIAN AND MODERN SCULPTURE.

IN his second and concluding address on sculpture, Mr. W. R. Colton, A.R.A., made some interesting comments on the art of India, a country that he has recently visited, but the essential feature of the lecture was its outspoken and unsparing criticism of the tendencies of certain sculptors of the present day. He was enthusiastic about the sculpture in the famous Isle of Elephanta, in Bombay Harbour, and described it as some of the most wonderful work of its kind in the world, full of movement and research for form and intensely decorative. From this the descent to the modern Indian sculptor was great indeed. His aims were petty and he had little sense of proportion, although he retained something of the old feeling for movement and for the texture of flesh. Mr. Colton, according to the *Morning Post*, referred to the general similarity of the ideals of the Greek, the Renaissance and the greater modern French sculptors, and complained that now the master minds were displaced and that we were called upon to worship a brazen serpent. A wave of popularity had recently placed sculpture on a new basis, and much notice was given to it in the Press, which formerly only referred to the art when the exhibitions were nearing their close. Unfortunately the most wonderful work of modern France, produced fifteen or twenty years ago, had given way to another kind of work against which the students should be warned. If they heard its qualities trumpeted from the housetops they might be sure that it was the firework and not the jewel that was being praised. Labour in some of this sculpture was represented by frightfully disproportionate hands and feet, and a misshapen monstrosity had been made to represent a mighty author. In support of his warning against what he regarded as false gods Mr. Colton quoted a passage from a recent address of Sir Edward Poynter's, in which the President said that "he failed to see that to adopt the pattern of design or colour or the startling methods of execution of some painter in vogue showed one whit more originality in the imitator than to follow in the steps of the great men of the past. Such apeing of eccentricity might be good for the comic journals, but for serious art never." A modern and a curious phase of the movement, said the lecturer, was that for mutilation in sculpture. It seemed that to lop off a leg or two legs or an arm and a leg greatly enhanced the artistic value of sculpture. Well, it certainly had one quality—it left more to the imagination, like the smoke of the battle painter. One genius had even gone further and split off a piece of a face. This was not a joke; it appeared in a recent exhibition of high class, where a considerable proportion of the sculpture was more or less mutilated, and one poor female had the appearance of having been through a bad railway collision. "But seriously," said Mr. Colton, "is not this the hypocrisy of art—a juggle to deceive the observer? Sculpture should not lend itself to the absurd or grotesque; it should be the expression of an idea." Mr. Colton spoke of the fountain as perhaps the finest expression of decorative sculpture, and he illustrated with the lantern screen a number of examples of fountains in England and on the Continent. Among them were two at Versailles, several in Rome, and others at the Alhambra, Pompeii, Cambridge and Lyons. Dalou's Paris fountain "The Triumph of the Republic" was also illustrated.

The Annual Meeting of the Photographic Survey and Record of Surrey will be held in the Public Library, Kingston-upon-Thames, on the 10th inst., at 3.30 P.M.

The Carnegie Dunfermline Trustees had at their disposal last year a total of 34,610*l.* 2*s.* 7*d.* The expenditure fell short of this amount by 1,992*l.* 14*s.* The principal items were the improvements on Pittencrieff Park and Glen absorbing 6,504*l.* 13*s.* 4*d.*, which includes 2,204*l.* 14*s.* 10*d.* spent on supporting and beautifying the hill on which stands the historic Malcolm Canmore's Tower, and 1,696*l.* 17*s.* 11*d.* in forming walks and erecting fences. Properties to the value of 6,486*l.* 10*s.* 9*d.* were purchased, principally with the view of improving the city amenities in the future.

NOTES AND COMMENTS.

IT was only right that the important subject of the erosion of the English coast should be brought before the House of Commons at the earliest opportunity. In about thirty years it has been calculated that 182,000 acres have been removed by the action of the waves. While the protection of the coast is left to local authorities, whenever land is reclaimed it becomes Crown property. The outlay is sometimes very large. The town of Bridlington has had to expend 100,000*l.* on works of protection. The President of the Board of Trade has promised to consider the subject. A Royal Commission will be appointed. But unfortunately its duties will extend to waste lands and afforestation. By the time the three subjects are investigated and reported on it may be taken for granted that the area of England will be further diminished. Waste lands and planting of timber require prompt consideration. But it must be allowed they have not urgency equal to the encroachments of the sea, and it does not follow that men can be found who are competent to deal with the whole of the subjects.

AFTER their return from Rome the painters who have resided in the Villa Medici as winners of the Prix de Rome often find a dreary interval awaiting them. Sometimes they are the victims of a prejudice which makes collectors believe that the prize-winners cannot escape from an antiquated method of painting, and hence their works are regarded as unsafe investments. With other men there is an expectation of power which it is almost impossible to realise. The late J. J. HENNER was more fortunate than most men, for he could paint portraits and gain medals before he was able to hit upon the peculiar style with which his name is associated. He was a modest man, who sympathised with others who were less fortunate. His nephew, M. JULES HENNER, knowing this, has presented the Académie des Beaux-Arts with a sum which will produce 9,000 francs a year. The fund is to be divided into three parts, which will be available for painters on their return from Rome, and which they can enjoy during three years. One hundred pounds per annum may be only a modest allowance, but it is sufficient to keep an economical artist from sacrificing his genius to the production of works of an inferior kind. After three years he should be able to shift for himself.

M. CAMILLE FORMIGÉ is one of the best known of Paris architects. He has long been connected with municipal works, for he was at one time on the staff of the late M. ALPHAND when he was carrying out the transformation of the city. He has been awarded the prize which was founded in 1900 by M. LHEUREUX, and which is alternately bestowed on a sculptor and an architect. The other recipients have been the late JULES DALOU, to whom modern English sculptors owe so much; CHARLES GIRAULT, the architect of the Petit Palais; LOUIS BARRIAS, the sculptor of the monument to VICTOR HUGO as well as of the *Bernard Palissy*; M. PASCAL, the architect of the additions to the National Library and other public works; ANTOINE MERCIÉ, the sculptor of the *Gloria Victis* and of the memorial to ALFRED DE MUSSET, which was unveiled a few days ago. M. FORMIGÉ is, therefore, in good company, and he is worthy of his position.

ILLUSTRATIONS.

VILLA OSWALD, COBLENZ.

FEW cities have such advantages of position as Coblenz. Situated at the confluence of the Moselle with the Rhine, it is no wonder that the ancient Roman generals recognised its utility as enabling its holders to command two important rivers. The views from it are among the most delightful along the Rhine, for, as all travellers know, the picturesque castle of Ehrenbreitstein is situated in view of many of the streets and places. It is therefore easy to understand why Coblenz should be sought as a place of residence. During late years a great many mansions have been erected from the designs of Herr WILLY BOCK, an illustration of one of which we submit this week. His countrymen realise that he avoids all imitation of French villas, that he never repeats himself, although in all his houses there is sure to be something which recalls the ancient manner of building in their country. It will be observed that he is no stickler for symmetry; that the planning determines the character of the exterior, and that an endeavour is made to gratify the inmates with pleasant prospects. His houses are recognisable at the first view. Herr WILLY BOCK enjoys, of course, the advantage of having excellent carvers in wood and stone at his command. In the Villa Oswald there may not be much scope for work of that kind, but the figures, heraldry and ornament are of a kind that adds piquancy to the windows. There is at the present time an excess of regularity in domestic buildings, and the daring experiment of an artist who has been described as "one of the most enthusiastic architects and a true magician" will be appreciated by English architects.

ARDLORNISH, POLLOKSHIELDS, N.B.

WESLEYAN HALL, EDINBURGH: THE GREAT HALL.

HOUSE ON GRIMM'S HILL, GREAT MISSENDEN.

THIS house, known as "The Chilterns," was built last year for Mr. ALFRED DUNHILL on a branch of the Chiltern Hills, and stands some 600 feet above sea-level. From the windows are obtained extensive views of the surrounding country. It contains three reception-rooms, billiard-room, kitchen and usual offices and six bedrooms. The billiard-room is a detached building connected to the main house by a conservatory, and is finished inside in a quaint fashion, with heavy rough beams supporting roof. The beams and rafters all show and are stained almost black, the intermediate spaces being plastered. The doors facing the main entrance hall are all of polished mahogany, having been supplied by the Gilmour Door Company. The house is lighted throughout by acetylene gas. The walls are of brick covered with rough-cast outside and whitened, and the roofs are covered with Dunton Green tiles. All the windows are casements, being painted white; the frames thereof, as also all outside wood and ironwork, are painted green. A pleasing feature on the front elevation is a small piano recess in the drawing-room, which stands in front of the main wall. The architect is Mr. J. BRUCE MERSON, of 76 High Road, Kilburn, London, N.W., and the contractor for the house was Mr. GEORGE PARSONS, of Prestwood, Great Missenden; the contractors for the billiard-room were Messrs. ALDRIDGE & SON.

DESIGN FOR A COUNTRY RESIDENCE, WITH STABLING AND A FORMAL GARDEN.

THE accompanying design was intended to provide compact accommodation for a large family with combined and attached stabling on a site near Goring. The formal garden is arranged at the back and west side of the house, the latter being sunk and bordered with moulded coping and piers in stone. The general materials to the house are in Portland stone and red brick filling; the staircase window shown above the entrance—circular on plan—is in oak, and the gable over it in Memel fir creosoted. The casements are wrought-iron with leaded lights stiffened with square gunmetal bars. The billiard-room and kitchen face north, the front reception-rooms having the opposite aspect, and being provided with large bay windows to receive the sun.

THE ARCHITECTURAL ASSOCIATION.

A SPECIAL general meeting of the Association was held on Friday evening last at the premises in Tufton Street, Westminster, Mr. E. Guy Dawber, president, in the chair.

The meeting was called to consider the Council's proposal to add the words "Editor of the A.A. Journal" after the word Librarian in by-laws 21 and 30, and substituting nine ordinary members in by-law 21 in place of ten.

The President said the slight amendment was proposed by the Council as it felt that the post of editor of the Architectural Association Journal should be balloted for annually as in the case of other officers, and as it was not desirable to increase the number of ordinary members of the Council it was proposed that the editor should be an *ex officio* member of the Council. The alteration still brought the total of the Council to seventeen members as before. The Council also felt that it was eminently desirable that the editor should always be a member of the Council in order to be *au fait* with the work and policy of the Association.

The amendment was unanimously agreed to.

At the ordinary meeting which followed Messrs. A. D. Leroy, J. A. Mettham, D. Kibbler, E. S. Coldwell, H. Cyril Chatfeild Clarke, J. E. Lee, F. G. Geary, C. W. Ferrier and G. E. G. Leith were elected members.

Mr. F. T. BAGGALLAY read a paper, entitled

Porches and Approaches.

In making the customary apology for the imperfections of this paper, I may say (and you will readily believe it) that my chief embarrassment has been the enormous number and variety of examples that might be quoted, and the consequent impossibility of covering the ground at all adequately. I have failed to find satisfactory drawings or photographs of a few examples it would have been interesting to illustrate; but, again, the chief difficulty was to reduce the list to one that would not weary you. I am greatly indebted to Mr. Alan Potter, hon. secretary of the Architectural Association lantern slide committee, for help in selecting slides and in getting some made, and, in two or three cases, supplying the original photographs, and to Mr. Lewis for the loan of numerous plate illustrations.

In this room no apology can be needed for calling attention to the fact that, in many cases, nearly as many opportunities for architectural treatment are to be found in the surroundings, the accessories, and especially the approaches of a building as in the building itself. It is true that in the middle of crowded towns land is too scarce and dear for devotion to such amenities, unless the building be a public one or a palace. But in the open country and the villages, and even in small towns and suburbs, the meanest cottage or villa has at least, or ought to have, its proper forecourt. And many a commonplace building, great and small, has been redeemed from insignificance, many a beautiful one has been raised to the first rank, merely by the treatment of the approaches, or even by the addition of a well-designed porch to attract the eye and concentrate the attention of the passer-by.

In this country, at any rate from the time of the Druids until the last few years, there has never been any attempt to form those grandiose and impressive approaches which most other nations, ancient and modern, have deemed appropriate in the case of especially important or sacred edifices. And we have no porches which will compare, for instance, with those of some of the French cathedrals, on which the masons lavished so great a wealth of art and religious fervour. Our Mediæval forefathers spent, however, art and money on porches and gateways with enough liberality to show that they regarded such features as of more than ordinary importance. And from the Tudor period down to the beginning of the last century, the art of contriving decent and dignified approaches to private houses was well understood both in England and Scotland, and almost universally cultivated. If people did not rise, and could not often be expected to rise, to the magnificence of Bacon's three princely courts, with their walls and turrets, terraces and colonnades, architects, as is proved by existing plans, and the owners of a few great houses, strove to get within measurable distance of that ideal. And even the smaller houses, whether in town or country, were generally approached through at least some sort of enclosed forecourt of a formal and architectural character, with an outer gate on which a decent amount of art and money were spent.

The ideas and circumstances of the nineteenth century led, however, to a deplorable change. Formal approaches almost disappeared with formal gardens in a vain and childish attempt to imitate the beauties of natural landscape. The stately gateway, the straight avenue and the spacious forecourt gave way to a sort of glorified field-gate and a serpentine-road which seemed to turn every few yards to avoid a laurel or a nettle, revealing, by carefully-arranged accidents, occasional glimpses of the surrounding scenery, and at last lands one, sideways and unexpectedly, at the door of a mansion which, if the art were entirely successful, would seem to be situated in the midst of a wilderness. The hard utilitarian spirit of land and building speculation has dealt even more hardly with the forecourts of small suburban and roadside houses which, except for a cheap gate and a bit of cast-iron railing apiece, are left to be dealt with by tenants who have but a few years' interest at most in the property.

But as the love of beauty and appreciation of art grow and spread in the nation (as we all hope they are doing), we, as architects, are beginning to be called upon again to consider and to contrive those decent accessories and approaches without which a building, with even the smallest architectural pretension, is but a kernel without a shell, and, one with the greatest, a jewel without a setting. From the point of view of this paper it is especially worthy of note that the most striking sign of the better spirit has been the scheming of a grand processional approach road to London's Royal palace. It is true that an untimely, and, considering the occasion unlooked for, parsimony on the part of the public has shorn the work, for the present at any rate, of most of its architectural adornments. But the mere fact of its inception and execution is an encouragement to consider the question of architectural approaches generally.

Without attempting a strictly historical treatment of the subject, I may reasonably first call attention to the approaches to the great Egyptian temples as among the most notable examples of the grand manner. In their case the spacious open courts which have a prominent place in almost every great architectural scheme, ancient or modern, were in the strictest sense forecourts, and are supposed to have been a development of the walled spaces or outer defences in front of the mouths of caves, which were naturally used by the original inhabitants of the Upper Nile valley for dwellings, tombs and temples. When the great temples of Thebes were built the original purpose of the forecourts may have been forgotten, but their varied usefulness as well as tradition secured their survival. They secured privacy for the temple proper, and space for ceremonies and processions attended probably by large crowds of worshippers; and the porticoes which flanked their walls internally were in that climate, no doubt, a sufficient dwelling for the many servants and hangers-on of the establishment. In any case a second or even a third forecourt was in several cases added by the pride or care of successive generations. But the most striking feature of the approach to an Egyptian temple, a unique one in the history of architecture, was the pair of great towers which flanked and dwarfed the outer gate and formed the front wall of the forecourt. We call them "pylons," after Herodotus, and the proper Egyptian term seems to have been "sebkhet," which had much the same meaning—merely "door."

They were rather exaggerated walls than towers, of little depth but so high that they always overtopped the temple proper, sometimes by 100 per cent., and so wide that they usually well overlapped the side walls of the court. Their faces were smooth and slightly battered, and the main purpose of their peculiar form was evidently to provide a spacious and suitable field for the illuminated texts of the sacred scribes. Almost as certainly, I think, they represent the face of the cliff surrounding the narrow entrance to the original cave temple, and which must have been used for the same purpose. In front of the pylons were obelisks and colossal statues, usually seated, and, in some cases, it is said, the gate was approached through an avenue of sphinxes. At the opposite or inner end of the nearly square forecourt, between the court and sanctuary in the original arrangement, was either a deep open portico or an enclosed hall of close-set columns, the most important feature architecturally of the whole group. In most cases, when a second court was added the arrangement of pylon, court and hall (or portico) was repeated, and the famous hypostyle hall at Karnac was the hall of such an addition; behind it is the pylon of the original court. The whole of the approaches therefore to the Egyptian temple, when

Digitized by Google

fully developed, were an avenue of sphinxes, a pair of pylons, a forecourt, a hypostyle hall, perhaps a second pair of pylons, a second court and a deep portico or second hall of columns. It has taken a long while to describe, but it is perhaps the most ambitious system of approaches ever carried out. At any rate, it has never been surpassed in magnificence by any that we have the means of tracing fully.

In Chaldea the temples were mere shrines elevated on steep-terraced mounds, and approached by flights of steps or winding inclines. But according to more recent discoveries, these mounds were approached like the Egyptian sanctuaries, through one or two forecourts with more or less striking gateways. Several such gates are represented in the bas-reliefs in the British Museum, and usually consist of a square-headed opening flanked by square crenellated towers, as if for defence.

In Assyria the royal palaces were the principal buildings, but of the approaches to them we only know that, since they stood on mounds, they must have been reached by flights of steps, with inclines probably for the chariots. The main gateways seem to have had semicircular arches faced with glazed tiles or faïence, judging from the city gate discovered by M. Place. The responds of the arch were huge sculptured bulls with human heads, some of which have been removed to modern museums. There are two very fine ones in the British Museum. These gates were sometimes pierced through towers, and sometimes flanked by smaller ones. The sumptuous style of the staircases leading up to them may probably be fairly estimated from the ruins of those to the Palace of Xerxes at Persepolis, a building of much later date, but the general style of which was largely based on the Assyrian palaces. Perhaps I may be excused for showing at this point a view of a Japanese temple which I found in a French journal, and which seems to me to exhibit the effectiveness of stairs and terrace approaches even when combined with grotesque architecture and an incomplete symmetry.

Returning to the prehistoric styles further west, the approaches of the Mycenæan palaces differed again entirely from all those hitherto noticed. They were more like the approaches to a Norman castle. Indeed, the resemblance is striking if you forget the drawbridge and overlook questions of style. There may be nine-and-sixty ways of constructing tribal lays, but perhaps there is only way of constructing the approach to a tribal's chief fortress. The palace was built on a hill-top, and was only to be reached by a narrow road ascending the flank of the hill and exposing the right or unprotected side of assailants to the kind attentions of the defenders on the walls. There were several narrow gates to be passed, and they were carefully situated in internal angles of the wall exposed to a cross-fire of stones and darts. Utilitarianism of the sternest kind was alone considered until the main gate leading to the forecourt of the palace was reached. This, judging by remains, was more sumptuously treated, with internal and external porticoes supported on columns (probably wooden columns). These porticoes may have served both as shelter for the guards on duty and as the court of justice of the king or chief, in accordance with the practice of semi-barbarous chieftains in the East in all ages. Greece is not, perhaps, properly Oriental. But the Huns, at a later date, brought the practice with them much further west, and all we know of the Mycenæan civilisation, including the plans and decorations of the palaces, suggest an Eastern origin.

The gateway on the Acropolis at Athens, the admiration of the ancient world, and called by them emphatically "the Propylæa" (it is said the term was never used until modern times for any other gate) was undoubtedly merely a rebuilding, on a glorified and extended scale, of the gateway to the old palace of the kings of the Mycenæan period. The approach to the gates (the plural form of Propylæa is said to have reference to the two gates or two leaves of the gate, and not to the porticoes) curiously enough, as it seems to us, remained the old narrow steep pathway winding round the bastion from the south. Whether, if war had not intervened to stop the work, the road would have been improved too, it is impossible to say; but somehow it was hardly the kind of feat that one suspects would have appealed to the Athenians even if it had been safe. The genius of Greek art, however refined, seems to have been narrow. There is no clear evidence that it ever extended from the consideration of a single structure to a group. A little superstition or priestly jealousy was allowed, even at Athens, to cripple or to crowd the finest works, and each had to stand alone, neither leading up to anything else nor itself the crown of a comprehensive scheme. It is true that in many, perhaps in most, cases there was a wall and portico enclosing the court or "temenos" in which the temple or several temples with subordinate buildings stood. But in all cases with which we are fully acquainted the form of the court, the position of the gate and the situation and orientation of the various buildings seem to have been entirely fortuitous, or decided in each case separately without reference to the rest.

In considering Greek approaches, unless we accept partial and inconclusive evidence, we can only admire the fine judgment and unwearied industry of the artists in refining the proportions and the details of porticoes such as those of the Parthenon and Theseum, wondering whether it was really worth while, feeling that at any rate such an effort is beyond us in the present day and might even be rather absurd.

Of the ambitious spirit of the Imperial Roman architects in designing and carrying out the most splendid schemes of approach, there is, on the other hand, ample evidence in history and in the ruins of some of them. Marble porticoes, surrounding and leading up to spacious courts and decorative arches, triumphal, memorial or merely emphatic of an entrance or a particular point, were the chief materials with which they produced their effects. But they did not disdain on occasion a fine flight of steps, and, as their native temples were mostly raised on a high podium, that feature was common. The completeness with which Roman work has, in almost all cases, been destroyed unfortunately leaves little for illustration except a few ruined arches, rows of columns and some plans.

Triumphal arches were more often than not erected as entrance gates, in many cases in the provinces as the main entrance to the city. Among the well-known examples the Arch of Rimini was the south-east gate of the town on the Flaminian way. That at Beneventum was the eastern gate on the Appian way. That at Orange, in France, was the northern gate of the town. Those at the naval station at Pola, in Istria, at Treves, on the Moselle, at Autun and at Verona were all city gates. The late "Arch of Hadrian," at Athens, was the gate of one of the quarters or suburbs of the town which he rebuilt. The fine Arch of Trajan, at Ancona—so much finer in its erect simplicity than most of the over-enriched work of that emperor—was the entrance to the quays which he built. The arches of St Chamas were the entrances to a bridge, and so on. In Asia and North Africa most, if not all, the Roman city gates were of a similar though plain architectural character.

In Asia the city gate was often but the end feature of a street lined on both sides with either marble colonnades or covered porticoes, leading right through the town or up to its main feature. In Palmyra such a street seems to have existed before the great Temple of the Sun, or before the latter became the great feature and main glory of the city. And as the street did not run directly towards the temple, there was a bend to be disguised when it was desired to make the one lead up to the other. This difficulty was overcome by the arch seen in the view, which is built on the wedge-shaped plan familiar indoors on a small scale to all practical planners, but never, I fancy, seen elsewhere in such a size. Such streets are said to have existed from very early days—170 B.C., at any rate—in Asia, but we do not hear of them on any great scale in Europe, except in the case of Constantinople, where one leads from the forum to the palace.

The triumphal and memorial arches erected in Rome itself seem to have been generally isolated monuments, but the Arch of Trajan was the entrance to his forum, and the forum was the forecourt to the Ulpian basilica. The arch had a single opening, but was decorated with sculpture in the rich and heavy style which, it is suggested, was due to Trajan's Spanish taste. Some of the carving is now to be seen on the Arch of Constantine.

The forum was nearly a square of 400 feet, and on two sides had a double portico and an immense semicircular recess or hemicycle. The basilica occupied the whole of a third side, and was what we should call "double-aisled," with a large apse to accommodate a magistrate's tribunal at each end. On the further side of the basilica (from the forum) was the great column, which could be viewed from the galleries surrounding the small court in which it stood; and beyond that again the Temple of Trajan.

The whole group of the arch, forum and basilica, and the small court may reasonably be looked on, from the architectural standpoint, as the approaches to the Temple of Trajan, the crowning feature of the most magnificent of

Digitized by Google

Roman works, or the one at least which most forcibly struck the imagination of those who, in later times, saw it when partly ruined.

Another finely conceived approach was created in Rome by that great building emperor, Trajan's successor, Hadrian. It led to his mausoleum, now called the Castle of St. Angelo, and took the form of a bridge over the Tiber leading from the stone quay on the city side right up to the gate of the mausoleum (the quay on the mausoleum side now buries several arches of the bridge). There were, of course, as in the case of other ancient bridges, arched gateways at the ends, which, like the decorative parts of the mausoleum, have disappeared; and if it were not for Bernini's angels the whole affair would now be very tame and uninteresting. The temptation to dwell on Roman approaches of the Classic period is great. They were so well conceived; but they are difficult to illustrate, and I will only mention one other example, that at Baalbec. I do so on account of its many curious and interesting peculiarities.

A flight of over fifty steps and 150 feet wide leads up to a front close on 240 feet long, and consisting of an open portico of the Corinthian order, stopped at the ends by what are supposed to have been towers (towers open at the sides to the portico). Behind this broad porch is a hexagonal court, surrounded by a peristyle, and outside the peristyle deep recesses (an arrangement like an aisle with chapels outside it). Beyond this was the great forecourt of the temple, about 400 feet square, also with its peristyle and recesses. The temple itself was raised on a podium reached by another flight of steps. The most singular feature is the hexagon court, and if you look at the plan of this with the long portico and two towers in front of it, I think you must be struck by its resemblance to the plans of such buildings as the Minerva Medica, at Rome, and San Vitale, at Ravenna, both of which are, however, on a much smaller scale. The long portico with its towers, which was built by Antoninus Pius about 160 A.D., would probably be found to be neither singular nor original if we knew more about Syrian buildings. Herod's temple, erected nearly 180 years earlier, and several others, seem to have had similar porches. Another curious feature at Baalbec, one which is found in other more or less contemporary buildings in the east of the empire, but did not reach Italy until later, is the breaking-up of the entablature into an arch over the middle intercolumniation of the portico, the space being made especially wide for the purpose.

Of the buildings of Rome's great rival, Persia, we know but little. Of courts and gates I have found one solitary plan. But the entrance to the palace itself under the Sassanian dynasty was too remarkable to be passed over. It consisted of a large and lofty hall end-on to the front of the building, but recessed into it and vaulted with an elliptical barrel vault, the major axis of the ellipse being vertical. There was no outer wall whatever at the front end, so that the appearance was something like that of a huge cave nearly as high as the wall. This entrance-hall at Ctesiphon was 163 feet deep by 86 feet wide and 105 feet high. At Firouzabad it was 90 feet deep and 45 feet wide, and two apartments not very much smaller opened into it on each side in the same cave-like way.*

There is a curious superficial resemblance between the elevations of the front of the palace at Ctesiphon and the front of Lincoln Cathedral. It is only superficial, for the great arch at Lincoln is quite shallow, and one can hardly suppose it anything but accidental.

In the first few centuries after the great revolution, when Christianity became the State religion of the Roman Empire and the capital was removed to Byzantium, architecture, in both the east and the west of the empire, was almost wholly occupied with the building and rebuilding of churches. The last remnant of pagan worshippers were eventually scattered by a destruction of the temples as deliberate and as sweeping as was, say, the destruction of images by the reformers in this country. But before that happened the followers of the new religion were already divided on points of doctrine, and during several centuries, as the balance of authority or popularity swayed from one opinion to another, every church in turn was subject to attack, and was sometimes destroyed. In such circumstances it is not surprising that the churches assumed on the outside something of the forbidding aspect of a fortress. Among other things the entrance to every church was guarded by a broad narthex, or porch, and a spacious forecourt—sometimes, in this style, called an atrium. The latter was surrounded by a high wall with a portico or cloister on the inside, the main object being, without doubt, to provide a refuge for defence in times of need for those members of the congregation for whom there was no room in the church. If the particular doctrine professed by that congregation triumphed, the court was promptly filled again with penitents seeking admission or readmission. All the earlier courts have either disappeared or been rebuilt, and I can only show you the well-known one in front of the church of St. Ambrose, at Milan, which, though it used to be attributed to the ninth century, can hardly be earlier in its present form than the twelfth. It is not so square in plan as seems to have been usual; indeed, it is a double square. And it has cross-vaults and clustered piers. The proper place for penitents in times of peace was the porch—or, as we call it when it extends across the whole width of the building, the narthex. Since religious revolutions were frequent and the penitents on every occasion numerous, and since they were sometimes kept a year or two before being readmitted, one can readily understand the necessity for so much space. The narthex of St. Laurence without the Walls at Rome is unquestionably made up mostly of materials of very early date. The church was built about 330, with a narthex at the other end. But the orientation was reversed in 578, when a new nave was built, and the old narthex apparently built up and converted into a sacristy. It is not unlikely that four of the columns which are spirally fluted, and all the Ionic caps and entablature came from the old narthex. But they all seem too good even for the fourth century, and were probably, in any case, stolen originally from some Classic building. The same is no doubt true of the materials, or the most part of them, making up the narthex of Civita Castellana Cathedral. The central arch is an effort beyond the architectural skill, and out of keeping with architectural style, of 1210 A.D., when the building was erected (as is recorded in two places upon it). But before the end of the twelfth century the spacious portico of the ancient world, which stretched across the whole width of a building and was part of it, often the chief part architecturally, was disappearing in Italy. Having given to the architecture of that country such approaches as the porticoes of the Pantheon, S. Vitale, S. Ambrogio, and last, but not least, St. Mark's, it had to give way, in deference to the almost universal poverty of the times, to the porch, a feature proportioned to the door and not to the building. I think it is in Street's "Brick and Marble Architecture in Italy" that attention is called to the fact that the porch is a feature confined to the north side of the Alps. And though that is not strictly true, the porch has never flourished in Italy. There are plenty of those deeply-recessed doorways, of which it is always hard to say whether they should not properly be called porches. But the porch proper is rare, and, with two or three exceptions, is only found in the form of a shallow arched hood tied with an iron rod and resting on two columns, which columns often stand on the backs of lions or griffons. This form lasted from the twelfth to the seventeenth century, with changes only in ornamental details. On examination a good many of those attributed in guide-books to the twelfth century must be put down to the thirteenth century or even later. The two at Bergamo are of the fourteenth century. That on the south side of the church bears, according to Street, the date 1360 and the name of the mason. But some, such as the porches of Modena Cathedral, S. Zeno, at Verona, and others, may very well be work of the latter part of the twelfth century. The south porch at Ancona is possibly of that date, but the west one is almost certainly thirteenth-century work. If you look closely at the photograph, too, you will see clear indications at the springings of the arch and in some wall shafts outside the porches that it was once a triple porch with three doors into the church. I think the irrational idea of putting the columns on lions' backs must, though some critics will not have it, be borrowed from the East, where the fashion is ancient and persistent. The beast, whether lion or griffon, has often another beast or man in his paws, and they are said to represent supporters of the Church or of orthodoxy triumphing over Saracens or heretics—a piece of symbolism which would not have seemed so childish to the ignorant and barbarous folk of the twelfth and thirteenth centuries as it does to us.

The most remarkable of Italian church porches is the gigantic one attached to the church of S. Antonio, Piacenza, and called "Il Paradiso." The pinnacles and wheel-

* Dimensions from Mr. Spiers's paper in R.I.B.A. Transactions, 1891.

Digitized by Google

window are quaint and, I think, pretty. The size and the form of the structure are unique, but how it could acquire the name of "the Paradise" is a puzzle. One can only suppose it was different when first built. The buttresses look as if they were additions. Not impossibly it was stuccoed and enriched with paintings. The only other Italian church porch that I know, and that is worth a passing reference, is at the west entrance to Ferrara Cathedral. Like the last, it is unique, but it is its beauty that makes it so. And it must owe its beauty almost certainly to some French mason who, at a later time, added to the regular twelfth or thirteenth-century Italian porch an upper storey which, as Street said, looks at first sight as if it had been transported from Northern Europe.

However restricted one may find the subject of porches when dealing with Italy, the same cannot be said of Mediæval England and France, where churches and cathedrals afford an endless and varied series of examples, on which it is the merest platitude to say the artists concentrated their best work. This section of my subject is, however, so familiar to most of you that I do not propose to go into it at much length.

France claims attention first on account of its superiority in the richness and number of first-rate examples, and also, I think, on account of its having been rather earlier in the field. The magnificent series of the great cathedral porches allied to those at Chartres and Amiens cannot be equalled or approached by any series of existing works of any age or country, either for richness, for beauty, or for a deliberate and spirited effort to lift the mind of the entering worshipper to higher things. It seems to me that their merit is enhanced by the fact that in outward appearance many of them fail to show as porches. Built between salient buttresses, and surmounted by galleries, parapets and pinnacles, they are artfully confounded with and form an integral part of the front. Instead of projections we seem to see deeply-recessed doorways. This series, with its alternating shafts and statues in the jambs, and its sculptured tympanum and central shaft, probably owes its origin to the eleventh or twelfth-century portals, of which two famous ones in Southern France, at St. Gilles and at Arles, have survived as samples. In its later developments the coping of the gable parapet came down and joined the hood-mould at the bottom, and curving upwards ran up into a great finial, and the space within and around it was filled with light flowing tracery or sculpture. Eventually, as at Tours and St. Riquier, this aspiring moulding was snubbed off, as it were, a little above the top member of the arch, leaving a curiously-shaped panel; and the Flamboyant detail melted almost imperceptibly into the more Classic forms of the François I. style without losing either its richness or its apparent complication.

These triple porches are the typical French Gothic portals, and the telling porch of the little church of St. Maclou, at Rouen, which everyone knows, and which, I think, everyone must admire, may perhaps be considered only a clever variation in plan on much the same theme. There are, of course, other types, and if among the members of the cycle and camera clubs there are any students of Gothic left, or if they get tired of touring their own country, I can strongly recommend them to the village churches of France. They would find a tour there enrich their minds at no great expenditure of money. At present, as I want to get on to English work, I will only mention one other French porch—an early one at the ruined church of St. Pierre, near Vézelay. It is a low building, three-aisled, of the full width of the church, and almost as much projection. It is groined from slight piers internally, and its form reminds one of the Galilee at Durham. I shall be glad if anyone can explain its purpose to me.

(To be concluded.)

A Paper on "Church Fittings" will be read by Mr. Charles Spooner at the meeting of the Liverpool Architectural Society on Monday next.

The Glasgow Institute of Architects were informed at their last meeting that, in addition to the prize of 2*l.* 2*s.* given by the Institute, gained by Mr. Wm. Ralston, a second prize of 1*l.* 1*s.* had been awarded to Mr. Thos. A. M'Adam in the competition for the Institute's prize in the Technical College. Messrs. Crawford and Lindsay were appointed adjudicators for the School of Art prizes. A draft letter regarding the subject of the number of apprentices employed in architecturai offices was submitted, and it was agreed that the letter should be issued to the members of the Institute.

MODERN SCULPTURE.

On Monday at the Royal Academy Mr. W. Goscombe John, A.R.A., delivered a lecture on "Modern Sculpture." He described Bernini as "the first of the moderns." This seventeenth-century artist had been criticised and condemned, but in spite of the extravagance and the excess of movement in his work (characteristics of the period) he was a man of originality and power, and to him we owed the freedom of modern sculpture. The seventeenth-century influence continued well on to the end of the eighteenth century, when two men became prominent, Canova and Houdon. The influence of the antique on Canova led him to make slavish copies of antiques in the Vatican, and the effect of his art had gone for ever, while that of Houdon retained all its strength. The name of Houdon would always be associated with the truly classical, and in insight into character and power of expression he had never been surpassed. His busts stood alone, no other sculptor had ever left such a collection, and the Roman bust was the only thing that could be compared with them. In England the statue of James II., said to be by Grinling Gibbons, was the best work accomplished since Torrigiano visited the country. Roubiliac was refreshing—despite his faults—in a dull age of mediocrities, and his best successors were Bacon and Flaxman. Bacon was the first great English sculptor, the others were all foreigners, and with him the race of native artists began. Flaxman's fame would probably rest more on his outlines than on anything else, and the work of another man of the period, Banks's "Falling Titan," was curiously like that of Rodin. Mr. John referred to the decay of sculpture in England at the end of the eighteenth and the beginning of the nineteenth century, and said that when the Elgin marbles were brought here even Flaxman was not enthusiastic about them, and preferred the Apollo Belvedere to the Theseus. Haydon was the champion of the Elgin marbles, but he was as one crying in the wilderness, and for another half century the Apollo Belvedere reigned supreme. Gibson the lecturer passed over with but little praise. His work had simplicity and sculpturesqueness, but it lacked emotion, and in art emotion was the quality that distinguished the quick from the dead. France in this period of classical revival had been producing sculptors—in fact, there had been no time when she had not produced them, and the tradition of the ancient sculpture seemed to have descended to her naturally through Italy. The French had written their national epics in marble and bronze, and sculpture had surely never been more nobly employed than in France during the last fifteen years. There had been three great periods of sculpture in the world, the Greek, the Renaissance and the French. It was Rude who headed the third period, and in its own way nothing surpassed his relief of the "Marseillaise." Carpeaux, the gifted pupil of Rude, was the first of the distinguished band of modern sculptors who had shed lustre on France, among them Barye, Falguière, Frémiet, Mercié and Rodin. Since the Assyrian sculptures there had been no animals to compare with those of Barye. Falguière, essentially a modern, had a facility and a rapidity of vision unequalled among his contemporaries. His influence was great in the schools and it was his teaching more than any other that had produced the wonderful modelling now common among the younger French sculptors. There was Dalou, too, whose work never suggested the model and was full of a sense of the open air, whose nymphs and satyrs looked as if they never could have worn clothes. England owed Dalou much for his teaching here, and he, too, loved England. Mr. John having touched on the work of Frémiet, Dubois and Mercié, then turned to Rodin, whose name was received with applause by the students. Rodin was said to be a fighter against much that was conventional in sculpture. It was a matter for regret that his work had been the subject of so many polemics. If you listened to one side you were told that his sculpture was finer than ancient art, while his opponents described him as a trickster. Rodin was a great artistic personality of whom we should all be proud. The author of the "St. Jean" needs no eulogy; he has written his name in the annals of sculpture. But in his case, too, added the lecturer, time would separate the gold of his work from the dross. In Italy the glory of the sculptor seemed to have departed, although as carvers the Italians had no equals. In Germany no great sculptor had appeared since Rauch, but Russia had two men of note in Antokolsky and Prince Troubetskoi. Few men to-day were producing more suggestive and

Digitized by Google

delightful work than St. Gaudens, America's most distinguished sculptor. Among English sculptors Mr. John paid a tribute to the memory of Onslow Ford and Bates and Armstead, and spoke of Stevens as "a truly great artist—a splendid anachronism." Joseph's "Wilberforce" in Westminster Abbey he regarded as almost worthy to stand by the side of Houdon's "Voltaire." Mr. John's address was illustrated with numerous lantern slide pictures of sculpture.

PROPOSED EXHIBITION OF SCULPTURE.

THE following petition from the Society of British Sculptors has been sent to the London County Council:—

We, the Society of British Sculptors, which has been incorporated for the advancement and protection of British sculptors, wish to approach you, the representatives of the people of London, with a proposal for the holding of an exhibition of British sculpture, and with a request that the London County Council will assist us to carry out this desirable object by granting a temporary site and building where an exhibition of the art of sculpture can be properly seen for the first time in London.

We will proceed to give our reasons for holding such an exhibition.

From the time of the injunction issued by Henry VIII. which destroyed all images, the art of sculpture has been discouraged and looked upon with a certain conscientious fear, so that when our public buildings required sculptured decorations the sculptor had to be imported into the country, for example, Torrigiano for the Henry VII. monument, Caius Cibber for the Royal Exchange, Sheemaker for St. Paul's Cathedral, Roubiliac and many others for our great monuments, even down to our own time, when some of our principal works are by foreign sculptors, so that the national art in the country has been sadly neglected and most inadequately exhibited, resulting in a national loss; for by the art of sculpture a nation expresses its ideals, and its appreciation of the great deeds of its children is thus handed down to history.

To remedy the result of past neglect, the sculptors of Great Britain have formed themselves into a Society with the object of encouraging and protecting the art.

It is little if at all known what a mass of beautiful work has been done by the silent enthusiasm of modern sculptors. Their works may have been from time to time inadequately exhibited and then returned to them, to be buried in the studios and finally forgotten. Thus many of our ideal works have been lost to the nation. It is with a view to bring together these works executed within the last twenty-five years and enable the public at large to have some idea of the wonderful progress the art of sculpture has made in Great Britain during that period, and what talent is hidden, undreamt of by the public, that our Society seeks the aid and co-operation of the London County Council.

We may mention that your Council has more than 600 students in its schools studying the art of sculpture. It is hardly logical that the cost such education must involve should be incurred without the country being able to see the result in the executed works these students ultimately produce, or that so much seed should be sown and the country never reap the harvest. Its introduction into the schools proves that the art is considered necessary for the nation's progress.

It is doubtful whether any private institution could provide a building suitable for the complete display of all the arts, and it is only by the assistance of a representative body that an art such as sculpture can be fostered and encouraged. Moreover, it is a matter of the gravest municipal concern that the public buildings, squares, and streets should be appropriately and beautifully decorated. London gains by the enhancement of the beauty of its streets and the appropriate decoration of its buildings, and the public authorities owning land and buildings have a direct interest in this gain.

That municipalities have recognised the importance of the arts to their welfare is manifested by the city art galleries in Liverpool, Manchester, Bristol, Bradford, Glasgow, and throughout the Continent of Europe; indeed, all over the world.

In England hitherto the art of painting has been most prominent, greatly to the neglect of the arts of architecture, sculpture, and the applied arts.

We, the sculptors of Great Britain, ask you to be the first city to give to the art of sculpture, which we consider none the less important to the country's interest, that recognition and encouragement which alone can be done by you, the representative governing authority for the county of London.

We trust that the Council will so far sympathise with our objects as to grant our request for the temporary use of a site and temporary buildings if possible either in Aldwych or Kingsway.

Council of the Society of British Sculptors.—Thomas Brock, R.A., president, Alfred Drury, A.R.A., George Frampton, R.A., W. S. Frith, F. Lynn Jenkins, W. Goscombe John, A.R.A., Charles Lawes-Wittewronge, Bart., T. Stirling Lee, David McGill, F. W. Pomeroy, A.R.A., W. Reynolds-Stephens, Hamo Thornycroft, R.A., F. Derwent Wood.

THE CHICHESTER CAMPANILE.

A MEETING of the executive committee of Chichester Cathedral Restoration Fund was held on Monday in the chapter-house at Chichester Cathedral. The hon. secretary (Mr. W. B. Freeland) presented a report as to the result of the appeal recently made to the county for the purpose of completing the restoration of the bell-tower and of replacing the lead roof of the cathedral, now in a precarious condition. He had to regret that the result of the appeal was not quite so favourable as the committee had hoped. There had, however, been a very general response to the appeal, and subscriptions to the amount of 1,055*l.* and upwards had been paid or promised, in addition to the 500*l.* promised by the Ecclesiastical Commissioners, and the treasurers already had in hand upwards of 600*l.* towards the proposed work. In the absence of Mr. Somers Clarke, the architect who has the supervision of the work in hand, and who is now abroad, he (Mr. Freeland) had consulted Messrs. Vick & Sons, of Chichester, as to the precise nature and probable cost of the further work to the bell-tower, and understood from them that at least 2,000*l.* would be required to complete the bell-tower, and that the repairs to the cathedral roof would also cost 3,000*l.* The latter work they thought was not so urgent, and could wait a year or two provided the ordinary current repairs to the roof were proceeded with, and their suggestion was that they should be instructed when the proper time arrived to proceed forthwith with the repair of one-half of the bell-tower, which would, they estimated, cost about 1,000*l.* They would erect a scaffolding so as to embrace one-half of the building and then, when the repairs to that half were completed, they would proceed with the other section, and they suggested that the northern half should be first undertaken inasmuch as there was greater danger to the public on that side from falling fragments. This work would employ them practically during the whole of the summer, by which time the committee might reasonably hope to have the necessary further funds in hand.

It was resolved, says the *Sussex Daily News*, after discussion in which the Duke of Richmond and Gordon, the Dean, Canon Deane and others took part, that Messrs. Vick & Sons should be instructed under the supervision of the architects to proceed at the proper time with the repair and renovation of the bell-tower to an amount not exceeding 700*l.*, which, with the instalment of the contribution from the Ecclesiastical Commissioners now due, would shortly be in hand, and the Secretary was instructed to give the necessary directions. It was anticipated that there were many people in the county who were intending to subscribe, but for one reason or another had not decided on the amount of their contributions. In order to complete the contemplated work and so secure the cathedral from the ravages of time for a considerable period to come, 3,500*l.* is still urgently required.

The Secretary further reported that of the instalments of subscriptions to the old restoration fund a sufficient amount had now been received to warrant a further grant for the purpose of proceeding with the pointing of the cathedral, which still requires a great deal of attention; and on the motion of Canon Deane it was unanimously resolved to apply another 100*l.* for this purpose.

Mr. Henry Mather has been appointed surveyor to the Urban District of Surbiton, at a salary of 250*l.* per annum, in succession to his father. Mr. Mather will not be allowed to take private practice.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

AT the rooms of the above Society, on Thursday, the 22nd ult., Mr. A. W. Waddington delivered a lecture on "Domestic Architecture: Some First Principles." Mr. R. A. Smithson was in the chair.

The lecturer commenced by indicating his impression of the exact position of the various claimants to the title of domestic architecture. The first is the work of the average building draughtsman, whose idea of a home is that of a convenient bodily resting-place and shelter and nothing more. A more exclusive, or rather inclusive, claimant is the work of a true architect. The third claimant is an intermediate one, falling between two stools, inasmuch as it is not in healthy contact with building materials and not in reach of artistic touchstones. It is because the vast bulk of modern houses show this unsatisfactory stage of development that a discussion of first principles is necessary. The ideal architect is the philosopher among the builders, and a philosopher is one who is genuinely in love with ideas, *i.e.* vital first principles. Amongst the main first principles of this sort are those of "the one and the many," from which principles of harmony and variation, subordination and individuality are evolved. The dangers of exaggerated unity are monotony and slavishness; those of exaggerated diversity are restlessness and license. The especial problem of to-day is how to obtain unity without monotony. The lecturer's excuse for an insistence upon the obvious in theory was that it was obviously forgotten in practice. Turning to illustrations of this main first principle of the interplay of subordination and freedom in architecture, the two great types are found in Greek and Gothic. Modern work reaches neither the obedience to perfect law shown in the one, nor yet the perfect liberty of the other. A house is a group of units—rectangles necessitated by rooms and other divisions. In the relation of these units, natural inequality suggests the needful diversity; true scale and proportion, and, above all, simplicity of main lines tends to unity. In detail the roof is the first consideration, as giving dominant boundaries vertically and horizontally; the windows, as the eyes of the building, are the next consideration, as giving brightness and interest. To attain unity the main rectangle of the block should never be confused by subordinate parts; equality between natural divisions is usually bad; proportions should be subtle, and not too obvious in value. The unit of subdivision (as in window-panes) should be carefully selected, and not changed without reason; hips or gables are not interchangeable on equal terms. Changes of method were changes of key, varieties of materials and of colours also, and should be kept to a minimum. On the other hand, a variation of minor features gives interest, and symmetry, as in gables, gains by contrast with unsymmetry elsewhere. But counsels of perfection, if of use at all, are useful as items of good taste, and good taste is a trained capacity to grasp first principles, first in feeling, then in thought. In attaining good taste sympathy with the individual artistic value of materials is requisite, and co-operation between mind and matter, sufficient not only to make a physical rearrangement, but a mental creation of beautiful form.

EGYPTIAN ART.

THE first of a series of lectures on Egyptian Art was delivered on the 19th ult. at the Continental Hotel, Cairo, by Professor Flinders Petrie. The lectures are given, like those of two years ago, in aid of the Anglo-American Hospital and the Church Poor Fund.

The first lecture was on that period of imitative art from the nineteenth dynasty till Roman times. Professor Petrie remarked that, though the art of ancient Egypt is more or less familiar to everyone, yet it is generally credited with the style which is only the latest and least original form which it assumed. Its long history is ignored, and only its worst phase is commonly recognised. The cause of this misunderstanding is clear. The latest buildings were those which survived most completely. They attracted the attention of the European copyists by their preservation, and hence the early publications filled the popular view with the great temples of the base epoch. Then worse has followed, for bad copies of this bad work have been placed before our eyes for trade purposes, until the vilest parodies have come to be accepted as representing ancient Egypt to the public mind. What is commonly called Egyptian decoration is worse than the worst debasement which ever took place anciently.

The same misunderstanding took place in regard to Greek art. It became known through Roman copies, and our great-grandfathers were brought up on the worst taste of the later Roman empire, and made yet worse copies of it. That stage of knowledge is much like the public acquaintance with Egypt at present. Since that, the good Roman work came to be appreciated, and at present all Roman copies are looked on as only indications of what we have lost of the great age of Greek art, and our understanding of it is drawn from the original sources of the creative age of Pericles and the still earlier times. It is such an appreciation of the true value and character of Egyptian art, as opposed to the late degradation of it, that will be brought forward in these lectures.

We shall deal with three main ages of art. The most familiar age, that of the late works, is our subject to-day, and it is best understood in general. It was the age of imitative art, when there was no hope for good work except in the copying of what went before it. The earlier age of conscious art and of scholarly training in art we shall consider next week. And the really formative period and spontaneous art will be best understood after considering the more familiar periods.

The beginning of the imitative period is in the works of Rameses II. That sovereign is best known by his profusion of monuments; but all of them were hopeless imitations when they were not direct thefts of earlier works. We see in them the stiffness of mechanical copying by rule, and the weakness of mere smooth finish is seen under his successors. Rameses III., unable to avoid coarseness, tried to give the virtues of his failings by an attempt at strength in the use of deep shadow.

The methods of training the artists can be seen in the drawings and carvings of students which have been preserved, such as the heads and figures of kings, and one observant sketch of a young peasant. Through the weakness of the later work a certain ability is seen for conventional expression, and some of the wooden faces of coffins are graceful and refined. In statuary, good traditions may be seen mixed with clumsiness of attitude and pose, as in the gold statuette of Hershefi and the statue of Amenardus.

In the twenty-sixth dynasty the traditional relief fell to a very low condition, but improvement was sought by direct copying of older work. In these copies the detail may be almost indistinguishable from that of early times, but the lack of pose and unity of the figures at once betrays the copyist. The overloading with detail also shows the lack of originality.

The statuary of the age is better, but its success is largely due to using hard stones, with mechanical finish and precision of surfaces. The animal figures appear to us better than the men, but that may be due to our closer appreciation of the human figure. The polished basalt figures of the hippopotamus goddess, the cow and others in the Cairo Museum show this. Portraiture evidently attracted the best artists, probably because it was better paid for, as in modern times.

Under the Ptolemies the work is still poorer. The limbs are mechanically put together without any true connection, as in the *Philotera* in the Vatican. The work was entirely a matter of joining together so many separate parts by mechanical rules. In order to give some effect every part was exaggerated in an absurd manner, much like the degraded taste shown in the Farnese *Hercules*. The power of portraiture was the last surviving trace of Egyptian art, as is seen on some stucco heads of coffins.

The late architecture shows the same faults of mechanical copying, but new motives were sought for, as at Esneh. Some skill in graceful design still continued, such as the pavilion of Trajan at Philæ. The last survival of the old style of building is the Deir el Abyad at Sohag, where as late as the fourth century A.D. the temple type was adapted to a Christian church. It is to be hoped that this most interesting monument will be most minutely conserved in the coming repairs which are now promised.

It is an ungrateful task to point out the deficiencies of the work which usually passes as typical of Egypt, but it is only by contrasting this with what went before it that we can see how much greater Egyptian art was than is commonly supposed from the familiar examples.

"**Loch Achray,**" by the late Mr. Sam Bough, R.S.A., was sold by auction on Saturday for 980 guineas. The canvas measures 46 inches by 70 inches.

TESSERÆ.

Cagots' Churches.

THE Cagots are a mysterious race found in Gascony, Béarn and the Basque provinces. During many centuries they were treated as if they were accursed. They had to wear a peculiar dress, and most trades were closed to them. It is in the churches, however, that we find the most numerous and lasting proofs of the abhorrence in which they were held by the rest of the population. In some places they seem to have had at a remote period churches or chapels of their own—at least, the ruins or traces of small ecclesiastical buildings are found which popular rumour ascribes to them. In most of the churches of the west and south-west of France there is a small entrance door (now often walled up) called the Cagots' door, quite distinct from the principal entrance. There is also a division of the church at some distance from the portion of the church occupied by the congregation, which is understood to have been set apart for the Cagots, and a small holy-water basin for their separate use, the latter generally bearing traces of ancient sculpture. The Cagots were forbidden expressly to enter by the same door as the rest of the congregation, or to introduce themselves into any other part of the church than that set aside for them. The late Mr. G. E. Street, R.A., believed that although Cagots did not live in England, yet that lepers were in this country kept under in similar restrictions. He concluded that lychnoscopes or low side windows should be called "Eucharistic windows," as they were intended for the administration of communion to people who were compelled to keep themselves apart from the congregation like the Cagots of France and Spain.

Early Architecture of Greece.

The Odyssey enables us to understand what the palace of a king or a tribal chief was in those remote days. It was nothing but a wooden cabin, somewhat larger than those used by ordinary mortals. The temples of the gods had a similar origin. All races of men were at first contented simply to provide for the use of their gods enlarged habitations of the construction with which they had become familiar in building their own dwellings. But this very increase in size gave a peculiar character to the buildings. Homer expresses sincere admiration of the great wooden hut of Alcinous. Such admiration was the cause of artistic conceptions. The increased scale of which we speak brought forward in a peculiar manner some of the features of the common architecture; it gave rise to impressions which could never have been produced by the sight of the ordinary domestic dwellings, precisely because they were ordinary. These impressions were more or less vague, but it was enough that they were awakened at all, and that attention was directed to the new aspects of structures, so that the imagination, with logic to help it, could push on from point to point by a series of experiments, the aim of which was to achieve by means of the completest possible agreement between means and end the fullest manifestation of the impressions received. So soon as this point was reached architecture ceased to be an industry and became an art. Convenience and utility were no longer its sole objects. It strove to convey an idea and to excite admiration; it was not content with size in itself, but endeavoured to produce an impression of vastness superior to the mere fact of size.

Scottish Crosses.

Scottish crosses differ wholly from the English. They are of two kinds: the pillar crosses of the eastern coast, wherein we may include, as identical in character, several in the north of Ireland and the Isle of Man; and, secondly, the crosses of the Irish pattern. The pillars are lofty squared shafts of granite, or some very hard stone (sometimes of more than one piece, mortised into the other), from 8 to 20 feet high (that at Forres is 25 feet high), set upon pedestals of two or more stairs, tapering somewhat upwards, with squared heads. A cross of the Latin shape is conspicuously inscribed on the whole extent of the western face. Equidistant on the centre and four limbs are generally five round bosses, representing the sacred wounds; and at their intersection the limbs repose on a circle or circular disc—an arrangement common on some of the Runic monuments of the Danes and Norwegians, and resembling the Irish pattern. Their faces and sides are divided into compartments by lines, and are profusely and elaborately decorated with the well-known ribbon or mat-work pattern, chain and network diapers, and other devices of great variety. In general they present few representations of Scripture subjects; but many contain representations of groups of men engaged in combat; of ships, animals, fishes, serpents, emblematical and historical of the events and persons intended to be commemorated, as was often the case in the ancient sepulchral monuments of Rome, and sculptured with considerable skill. Of these in a few instances the subjects are sacred; but in such case the cross is of the Irish or Saxon pattern, and erected by another hand. The narrower sides are, in the Isle of Man, and two or three other places, occupied by Runic inscriptions, relating the occasion of the erection. They are often truly splendid monuments.

Mediæval Halls.

In the later feudal times the spacious lofty hall, left open to the roof, had its windows placed high from the floor and filled with oiled linen or louvre boards, or occasionally with painted glass. The floor of stone or earth had a part at one end raised a little above the general level and laid with planks. On this platform or dais stood a massive table and ponderous benches or forms and a high-backed seat for the master under a canopy. On the hearth, in the middle of the hall, were placed the andirons for supporting the ends of the brands that were arranged by means of a heavy two-pronged fork, the type and predecessor of the modern poker. On the roof over the hearth was a turret or louvre, filled with boards arranged so as to exclude rain and wind and permit the escape of smoke, and this was sometimes an object of considerable architectural beauty in the external aspect of the building. In this gaunt and aguish apartment, heated by a single fire, the company were in a position not much different from what they would be in the open air; not a particle of heated air could add to their comfort, for as fast as produced it escaped through the louvre; light was the only solace the greater number could derive from the blazing fuel, and the few who were in a situation to feel the radiant heat were incommoded by the current of cold air sweeping like a hurricane along the floor towards the fire. From the height of the louvre and low temperature of the smoke, few of the buoyant flakes of charcoal found their way into the atmosphere, and the larger the bonfire the thicker was the layer of soot deposited on each individual. Boisterous weather also brought its annoyance. Had the fire been made in an open field, they might have moved to the windward of the smoke, but in the hall, where could they flee to from its miseries? The country houses of inferior landholders and farmers were generally one storey high. If they were built with two storeys, the roof was so deep as to reach to the ceiling of the lower room. The hall and kitchen forming one apartment, and roughly plastered, was open to the timbers of the roof, and sometimes had a louvre and a window that could be closed with a shutter. When these houses had a room to sleep in, young and old reposed in the same apartment and several in one bed; servants made their beds on the floor in the kitchen.

Harmony in Architecture.

There are two sorts of harmony or concord in architecture. The first signifies agreement in composition, the other agreement in taste and style. There can be no concord in the plan of a building when the interior is after one fashion and the exterior after another. There can be no concord in the elevation of a church which has several orders arranged on its frontispiece, while the inside can only allow of one. There can be no concord in the decoration of a palace the front of which is ornamented with columns that are often useless, and the details of which present, by their over-simplicity, a glaring contrast between the florid and the mean. This want of concord is very remarkable in many of the most important modern monuments of art, where the columns only appear like ornamental excrescences, placed on purpose to cause the nudity of the rest to be more sensibly felt. The second kind of concord of which we have spoken, and which we termed agreement in taste and style, depends upon the union of the arts amongst themselves. It exacts from the artist a practical knowledge and habitual exercise of all those other arts that contribute to the embellishment of architecture. In edifices it produces that identity of character and that unity of style and manner which give to the erection the appearance of having been the work of one man, and which leaves room for doubting from the air of similitude which reigns between the decoration and the construction whether the decorator was the architect or the architect the decorator. This perfection is to be met with in the fine works of the ancients. As the

Digitized by Google

arts were then united amongst themselves, so one was scarcely ever followed to the exclusion of the others; whether the architect executed all the parts of an edifice, or whether he confided their execution to co-operators, one understanding alone always presided over the construction of the work; and, as one mind had directed the whole, the effect was single and the impression undivided. With the moderns it is not thus; every art in its practice is isolated from the rest. Architecture in particular must lose by this system. From it proceeds those dissimilarities often apparent in edifices, the construction of which was given up to artists acting without concert, and often without any knowledge of each other. It is not only by the employment of different artists without any reference to a leading or master artist in the first erection of a building that discord instead of concord is produced; the same result is the effect of repairing a building, either at different periods by the same artist, or by different artists at the same period, and still more so is this end produced by the employment of different artists at different periods. Unity of mind and unity of action and direction can alone produce concord either in music or in architecture.

Early Scottish Habitations.

The dwellings of the earlier period seem to have been mere pits dug in the earth, numerous remains of which in groups yet exist in Aberdeenshire on the banks of Loch Fine, in Inverness and Caithness. Thus near Aberdeen are some hundreds of circular earthen walls scattered over more than a mile in extent, 2 feet or 3 feet high, from 10 feet to 20 feet in diameter, within which are found charred wood ashes and decayed bones and vegetable matter. Others, probably summer dwellings, exhibiting like relics, are mere flat pavements about 6 feet in diameter, over which was erected the summer booth or shed. But, of all, those denominated Weems are the most remarkable, which are found in great numbers in Scotland, especially in Aberdeenshire. They are generally constructed underground or under artificial heaps of earth or large unhewn stones, sometimes in several apartments in an area occasionally 30 feet wide by 8 feet or 9 feet in breadth, with narrow passages about 3 feet high communicating to the small side chambers. Within have been found wood or peat ashes, earthen vessels, horns, bones of deer, horses, oxen and other animals, querns or ancient handmills of stone, with instruments of bone and flint, stone celts and bronze swords. They agree very nearly with the description given by Tacitus of the winter dwellings of the Germans, whom he represents as digging caves in the earth where they lay up their grain and retire for the winter. A remarkable fact is that their roofs have converging walls, being formed of flat stones made to overlap each other till they meet in the centre and form the primitive arch, a fact which at once demonstrates their identity in construction and probable contemporaneous erection with St. Columba's house at Kells, St. Kevin's Church at Glendalough and many similar structures mentioned by Petrie in his "Ecclesiastical Architecture of Ireland." The doors to these dwellings are marked by two upright stones, and enclosures, apparently for cattle or for their summer tents, are in the neighbourhood. Similar structures, in one of which was found an ancient torquated ring, exist in the Orkney Isles on the side of a hill by the sea-shore, where the ground has been excavated to the surface of the rock, leaving pillars upon which are placed immense slabs of stone. Dwellings of a cognate kind but with wooden rafters have been found in Forfarshire, Perthshire, Mid-Lothian and other places. A variety was disclosed by railway operations at Newstead, where among its contents were various carved stones with the usual cable or fillet pattern of Anglo-Roman sculptors. Among these primitive dwellings must be reckoned the very singular stalactite cavern called Kent's Hole, near Torquay, discovered by the Rev. J. M'Enery, wherein were found rude articles of pottery, the bones of animals, bone skewers or pins, a stone hatchet, many flint arrow-heads and a human skeleton laid at length; a boar spear of iron and another blade were found in another corner.

No. 119 High Street, Croydon, a handsome old house, one of the towns few remaining links with the early seventeenth century, is to be offered for sale next month. It is called Wrencote, is about 200 years old, and the architecture is ascribed to Sir Christopher Wren. Many residents are pleading for the preservation of the house.

GENERAL.

Mr. George Wade is to receive sittings from Queen Alexandra for a statue, which is to be presented to the London Hospital by the Governors and staff in commemoration of Her Majesty as president of that institution. Mr. Wade has also been commissioned to execute a statue, with panels, of the Prince of Wales, to be erected in Bombay to commemorate the royal visit to India.

The Lord Provost's Committee of Edinburgh Town Council last week discussed the proposal to found an art school in the city. It is understood that the Government are willing to contribute a certain sum towards this object on the understanding or undertaking that a considerable contribution is made by the city. It was stated that the Government were prepared, in the event of Edinburgh not doing something, to hand the sum over to Glasgow. Ultimately it was agreed to remit the matter to a sub-committee to consider as to the attitude to be taken up by the city.

Messrs. Christie sold by auction some old Burgundian tapestry—a set of four panels of the first year of the sixteenth century. Three of them were 4 feet in length, their width ranging from 10 to 13 feet. The fourth panel was considerably smaller. With this lot was sold two upright panels, bearing figures and inscriptions. The bidding ceased at 4,500*l.* A set of five panels of old Beauvais tapestry brought in 700*l.*

The Jury for architecture at the Salon during 1906-7-8 will consist of MM. Raulin, Vaudremer, Girault, Pascal, Daumet, Moyaux, Laloux, Nénot, Mayeux, Julien Guadet, Deglane, Paulin, Redon, Bonnier, Lambert, Esquié, Bœswillwald, Cordonnier, Defrasse, Bernier, Eustache, d'Espouy, Blavette, J. Lisch, Tournaire, Louvet, Guilbert, Roussi, Marcel, André, Yvon, Alfred Normand, Ch.-A. Gautier, Hannotin, Sortais, Loviot.

An Architectural Society has been founded in Halifax, of which Colonel Gray has been elected president and Mr. C. J. Fox secretary. A committee has been appointed to consider a revision of the local by-laws.

A Committee has been formed for the erection of a memorial to the late M. Paul Dubois, the sculptor, at Nogent-sur-Seine, his native place. The work will be confided to M. Alfred Boucher and M. P. Bœswillwald, the architect, who is a nephew of Dubois.

Mr. G. A. Hamilton Dickson, past president of the Transvaal Institute of Architects, is acting as assessor in a competition for the synagogue proposed to be erected at a cost of 25,000*l.* for the Witwatersrand Old Hebrew Congregation.

The Liverpool Education Committee are about to organise a competition, confined to architects practising in Lancashire and Cheshire, for plans and estimates of the secondary school to accommodate 400 girls in Aigburth Vale, with premiums of 50*l.*, 30*l.* and 20*l.* A proposal to make the competition unrestricted was rejected.

A Memorial Tablet to the late Mr. Henry Willett was on Monday unveiled in the Brighton Museum, to which he was a generous contributor.

Mr. Charles Herbert Lea, of Hampton-in-Arden, architect and surveyor, member of the firm of Messrs. Lister Lea & Sons, of Cannon Street, Birmingham, who died last October at the early age of forty-five, left estate valued at 12,235*l.* gross and 8,364*l.* net.

State of Winchester Cathedral.—A portion of the spandrel of the vaulting in the north-east of the retro-choir of Winchester Cathedral, closely adjoining Bishop Waynflete's chantry, fell during Monday night. There is a hole through the roof, and above half a load of masonry came down. Other portions of the adjacent vaulting are in danger, but are being watched. The fall is in the portion of the vaulting which was believed to be the soundest, as it is on the south side.

The Registration Sub-Committee of the Royal Institute of British Architects, consisting of the President, Sir Aston Webb, R.A., Mr. Edwin T. Hall, Mr. T. E. Collcutt, Mr. John Slater, Mr. J. S. Gibson, Mr. A. W. S. Cross, Mr. W. H. Seth-Smith and Mr. George Hubbard, and appointed by the registration committee "to take evidence for and against the principle of registration and to suggest the course of procedure to be adopted at the general meeting when the present scheme of registration comes up for discussion," desire to state for the information of members that they have held twelve meetings and taken the *viva voce* evidence of twenty-one architects practising in London and the provinces, a verbatim report of which has been preserved, and they hope soon to be in a position to report to the registration committee.

The Architect.

THE WEEK.

THE island of Cos is one of the most remote from the mainland of Greece, and it is outside the line of limitation in the Ægean Sea. It is near to Halicarnassus on the coast of Asia Minor. The Knights of Rhodes possessed a castle on the island, and it was supposed that the buildings were partly constructed out of the Temple of Æsculapius. That deity was worshipped on the island, and under his patronage was a school of medicine with an anatomical museum. Among the great men who were natives was the painter APELLES. On Friday last a lecture was delivered at the Royal Institution by Dr. R. CATON on the recently-discovered Health Temple. Messrs. PATON and HICKS had suggested a site for the temple, but the excavations were carried out by Professor HERZOG. The temple was arranged on three terraces at the side of a mountain. Evidently attached was a hydropathic establishment, to which water was conveyed by earthenware pipes. There were also consulting rooms and operating-rooms. On the second terrace was a large altar and near it an Ionic temple. On the site of the latter was a marble coffer which Professor HERZOG believed was the treasure chamber, but which Dr. CATON thinks was the receptacle for the sacred serpents connected with ÆSCULAPIUS and which modern sanitarians adopt as symbols. There were, moreover, houses or hospitals for patients, with dormitories, where they used to expect visions of the deity and visits from the serpents. WALTER PATER has described similar treatment as adopted in Italy. Cos must have been renowned for works of art, but they have long since vanished. Of the buildings only the foundations remain, with a few architectural fragments.

IT is at all times pleasant to employ local labour in carrying out an engineering or building contract, and at the present time there are several additional reasons in favour of that arrangement. But the question must always arise to what extent local labour is to be favoured. A private gentleman erecting buildings can, of course, pay any price he desires. But are local authorities justified in imposing a heavier burden on ratepayers than is necessary? This crucial question has arisen in Maidstone. A few weeks back the lowest tender for sewage-disposal works, amounting to 41,482*l.* 5*s.* 6*d.*, was accepted. But the contractors discovered they had made a mistake, and could not carry out the work for that sum. Applications were then made to the other contractors. One reduced his tender by 914*l.*, another by 1,000*l.* The lowest obtainable was Messrs. UNDERWOOD'S, of Dukinfield, amounting to 44,310*l.* 18*s.* 9*d.* The reduced tender of Messrs. WALLIS & SONS, of Maidstone, was 47,400*l.*—a difference of over 3,000*l.* Some members advocated that, owing to the prevailing distress the local tender should be accepted; but it appears that the extra amount would mean a 5*d.* rate. Every member wished that Messrs. WALLIS should have the work, but their duty to the electors compelled the majority of them to vote for the stranger.

IN the two cases of JAMES L. DENMAN & CO. *v.* Westminster Corporation and J. C. CORDING & CO. *v.* the Same, the construction of Michael Angelo Taylor's Act was again before the Court. The London County Council and the city of Westminster required a strip of land for the purpose of widening Piccadilly. The amount they required for this purpose was a strip of about 27 feet deep. Upon this strip was a building which occupied the whole of the strip, and, in addition, the ground adjoining to a depth of 30 feet, making in all a depth of 57 feet. It so happened that the construction of this building was such that it was possible to remove the 27 feet required and leave the remaining part of the building standing as a complete building. BUCKLEY, J., therefore held that the whole could not be taken under the Act, but only the part actually required for widening the street. A local authority which takes land under this Act are exercising powers which are in their nature judicial. They must come to an honest decision as to the part of a property required for widening, and for widening only. They cannot seek to obtain under the powers given by the Act a larger quantity of land than that actually required for widening the street, upon the plea that the advantageous disposition of such extra land will diminish the cost of widening the street, and so save the pockets of the ratepayers. A witness called for the defendants said that it was not uncommon for a local authority with this object in view to acquire under the Act more land than they actually wanted for widening a street. BUCKLEY, J., said that he was shocked at this statement. The local authority were entrusted with statutory powers to be used for the statutory purpose and for no other.

A MAN who in his fortieth year was able to win the position of assistant surveyor and deputy-engineer to the Drainage Board of an important city like Birmingham must have been distinguished for skill. Afterwards he obtained the highest post of city surveyor. That was the summit of the career of Mr. JOHN PRICE, who died after an operation on Tuesday morning. He had passed step by step up the professional ladder, and if he cared to accept them he might have looked forward to still higher appointments. He began with winning an exhibition for engineering in the Victoria University; next he was articled to Mr. HARTLEY WATSON, and then became a contractor's engineer, one of the best ways of acquiring practical knowledge. Afterwards he was an assistant engineer and then resident engineer in Barrow. He next served the sanitary authority at Barton, the Toxteth Park Local Board, and the Liverpool Corporation. When the late Mr. W. S. TILL, after serving in Birmingham for nearly half a century, desired to have someone to co-operate with him, Mr. PRICE was unanimously selected out of thirty-four candidates. In a couple of years he became city surveyor. During eight years he has carried out most important duties in drainage and street works, and the City Council on Tuesday recorded its appreciation of the ability and energy displayed by him in the duties of his office. He was only in his fifty-first year, and for more than thirty of them his labours have been arduous.

A CONTRACT was entered into between Messrs. LOW & THOMAS and the County Council of Dumbarton for the construction of a storage reservoir on the Finlas Burn, near Luss, Loch Lomond, for the Vale of Leven special water supply district. On making inquiries at the site it was stated by one of the Council's engineers that clay for the puddle wall was to be found on the ground. We need not say how important is that material for such works. But Messrs. LOW & THOMAS agreed with the Council's officer, and made out their tender on the supposition that suitable clay was available. After the works were commenced the Council's engineers refused to allow the local clay to be used, and insisted on clay being brought from a distance. If that arrangement had been understood beforehand the amount of the tender would be doubled. They accordingly applied to the courts to have the contract rescinded on the ground of an essential error. On behalf of the County Council it was argued that the work was undertaken by Messrs. LOW & THOMAS at their own risk, and that they were aware of what was required of them. After consideration the case has been withdrawn and new tenders will be sought as quickly as possible. It is not easy to demonstrate in a Court the differences between clays in suitability for puddle, and the inquiry would necessarily be costly. All the parties in the case have been well advised to avoid so difficult a task.

THE DUBLIN CONTRACT CASE.

IN *The Architect* of November 10, 1905, the first stage of Pearson & Co., Ltd., *v.* Dublin Corporation was described. The action was brought, it will be remembered, by the English contractors to recover a sum of 36,374*l.*, the cost of extra pumping and other works which it was alleged became necessary through the misrepresentation of the defendants. The case mainly turned on the character of the plans, on which an existing wall which was to be used as part of a sewage reclamation tank was shown to have a depth of 9 feet below the bed of the river, while in reality it rested on the bed. It was therefore not adapted for the purposes contemplated, and it was necessary for the plaintiffs to spend a large sum on extra pumping and other works. At the trial before the Lord Chief Baron the jury heard evidence during several days on behalf of the plaintiffs. But the judge decided that there was no evidence to go before them for consideration, and his Lordship directed a verdict for the defendants.

We pointed out on the former occasion that as the case arose out of the representation of the work on the plans, it should have been tried before a technical tribunal. As we then said:—"The question to be decided depended on the character of the plans, and whether they were prepared according to the customary practice, and did not differ in lack of information from those usually submitted to the examination of contractors who proposed to tender for large works. The case clearly was one for arbitration, and there is apparently no reason why that mode of determining the issue was not adopted." Mr. Justice Gibson in the course of the subsequent proceedings expressed a similar opinion.

It was not to be expected that Messrs. Pearson & Co. would calmly accept the first failure to recover 36,000*l.* for work done without making another effort. Besides, the points involved are of the utmost importance to them in respect of future undertakings, and, indeed, to contractors in general who are bound by English precedents. Accordingly application was made for a new trial. The arguments of counsel lasted several days, but eventually a majority of the Court decided that there was evidence which should have been left to the jury to decide upon, and a new trial of the action was therefore ordered. It remains to be seen whether the Corporation will continue the strife.

The arguments of counsel and the decisions of the judges are of a kind which may be considered, although the final issue is still in doubt. We have already contended that the case is essentially a technical one, and should be treated by technical experience, but it is not to be expected that all lawyers would accept that view. The Lord Chief Baron said at the first trial that he could not allow gentlemen of position to remain under an imputation of fraud without relieving them of that imputation. The Lord Chief Justice also took care to exonerate the Corporation from any supposition of fraud. But the most honourable men are liable to make mistakes, although they may occupy high positions. It would also be unreasonable to expect that the members of a large corporation or of a special committee should scrutinise every line drawn by one of their engineers or draughtsmen. The Corporation are no doubt responsible, like all ordinary employers, for the actions of their servants and agents. But in the majority of cases that responsibility is in no way connected with toleration of dishonesty. It would be a serious matter for contractors if those who employed them and to whom they looked for payment declined to be answerable for the work of their architects, engineers or surveyors. Yet the leading counsel for the Corporation seemed disposed to decline accepting such a position. One of the judges remarked to him that the engineers who prepared the plans were the agents of the Corporation. But counsel, in reply, said they were servants and not agents, which was a very different matter. Contractors will, no doubt, interpret the remark in a way which will not be favourable to the Dublin Corporation.

It appears that not only on the plans was the wall shown as having a depth, although invisible, of 9 feet below the bed of the Liffey, but on each plan were written the words "the existing walls are shown at their correct levels." In descriptions of specifications there may be disputes as to the meaning of words and phrases. But when a wall is drawn at a depth which by the scale measures 9 feet, any contractor or foreman could only put one meaning on the lines. As was said by Mr. Campbell, K.C., one of the counsel for the plaintiffs, "It was quite within the rights of the Corporation to have said to the plaintiffs, 'We want certain work done, and it is for you to make up your minds before you tender whether the work can be done at all or not,' but they had no right to go out of their way and set a trap for the contractors, which prevented them doing what they otherwise would have done, namely, make inquiries for themselves." Instead of having a foundation of 9 feet the wall had not 1 inch. It was simply a mass of material 20 feet wide which had consolidated and kept its place by its own weight, but as it consisted of stones without mortar it was not adapted to serve as a watertight barrier against the tides.

It might be supposed that the lines were drawn by some young draughtsman or copyist who was not clear about their meaning. But the most remarkable incident of the case was that one of the engineers of the Corporation who prepared the plans declared that the imaginative representation was a stroke of policy. Mr. Justice Boyd, in referring to the evidence, said that the engineer admitted that the existence of the wall was the backbone of the scheme, and that he intended on the plans to indicate that it undoubtedly ran down to 9 feet, and he further stated that the other engineers had no information as to the character of the wall, and that the plans were deliberately arranged and put forward and were mainly influenced by the desire to have a cheap job, and to induce the contractor to moderate his estimate. His Lordship considered that the evidence of this gentleman was most extraordinary, and was powerful enough to be submitted to a jury as to the existence of fraud in the preparation of the plans and for the obtaining of the contract. Mr. Justice Wright said that, having regard to the engineering evidence given at the trial for the plaintiffs, it could not seriously be suggested that there was no evidence to go to the jury of misrepresentation of the plans. Evidence was given that no borings were made to test the depth of the wall, and that the plans were deliberately designed to induce the contractors to tender at a low figure. Mr. Justice Gibson said that undoubtedly the plans represented that the backbone was there, a wall 9 feet below datum, and water-tight. The contract was made to carry out a particular scheme set forth on the plans, and not something essentially different. The plans purported to be honest plans, though inaccurate details might require modification. They represented what was the paramount subject matter of the contract. The three judges could hardly have agreed in taking a wrong report of the evidence.

The Lord Chief Justice, who was the only dissentient, had also to admit the novel statements, but his Lordship interpreted the engineer's evidence as meaning that he in no way warranted or guaranteed the truth of the representations he made, and that he did not intend that these representations were to be acted upon by the contractors, except so far as they were checked and verified by the latter. "No doubt," he said, "he made them for the purposes of the tender," but it was plain that they were to be used only for such purposes when checked and verified by the contractor. It will be seen from the foregoing opinions that three judges interpreted the meaning of the plans in a manner that would correspond with the interpretation of engineers and contractors accustomed to study similar documents. No doubt it was stated in the specification that the information given on the contract drawings was

Digitized by Google

the best in the possession of the Corporation but that they did not hold themselves in any way responsible for inaccuracy. But as one of their Lordships shrewdly pointed out, that related to ordinary inaccuracies, and did not suggest that things which had no existence were represented on the plans as if they were actualities. If the Corporation were not to be responsible for the plans why did they prepare them, instead of leaving it to the contractors to carry out a scheme of their own devising? It is no doubt a common practice in preparing specifications to endeavour to evade responsibility. But it is generally indicated whereabouts the intending contractor is to make an investigation. No contractor who had any experience would imagine that before he sent in a tender he was to make a costly examination of an immense wall which was 150 years old, and that divers were to be employed to discover whether it went down to a depth of 9 feet in one spot or along its whole length. Nor would it be in keeping with the usual practice for anyone who contemplated undertaking the work to cross-examine the engineers and the consulting engineers in order to discover what processes they employed in the preparation of the plans. A man who was so sceptical would soon find that he was not in favour with those who prepared contracts.

The Corporation will, of course, be guided about their future course of action in a great measure by the advice which their lawyers and engineers will give them. But they would do well to consider whether further litigation, whatever may be the result, will be advantageous for Dublin and for Ireland in general. An English man of business, on reading a report of the case so far as it has proceeded, is likely to have his prejudices about Irish ways strengthened. He will say that the case of the Pigeon House wall is in keeping with the majority of Irish transactions, and that defective plans or projects will never be admitted, but that blunder follows blunder and that money is expended without any beneficial result to anyone but lawyers. Engineers as well as architects in Ireland complain that of late when work has to be done in their country Englishmen are brought over to carry it out. Some important buildings in Dublin are examples of that system. But are not the speculators who invest in construction to be excused if they are fearful of running the risk of such law proceedings as have taken place in Dublin, and which may be continued, unless the Corporation are wise, for a still longer period? Irishmen are always complaining of their oppressive laws, and yet when there is a dispute over a plan they will not trust to arbitration by men who have special experience, but must rush into court, where publicity at least is gained. Such a case as that imposed on Messrs. PEARSON happily does not often arise in England, and anyone who wishes to see work executed must devoutly wish that similar litigation will be long absent from English courts.

NEW BOOKS.

BARTON-ON-HUMBER, in Lincolnshire, is one of the oldest of English towns. It is believed that the Romans must have had a station there. But for architects and archæologists it has most interest on account of the ancient tower and adjoining chamber of St. Peter's Church, which of late years are considered to be a survival of Anglo-Saxon work. RICKMAN did not at first refer to the church, because he would not recognise a Saxon period. His earliest style was Norman; for though, he said, "many writers speak of Saxon buildings, those which they describe as such are either known to be Norman, or are so like them that there is no real distinction." The earliest illustration of the tower appeared in the *Gentleman's Magazine* in 1816, and in descriptions which subsequently came out it was assumed to be Norman work. At a later time RICKMAN described the tower as a very singular construction. The window, with its baluster and other details, was so different from Norman examples, he allowed that there existed a probability of its being real Saxon. The first volume of "Notes on the Earlier History of Barton-on-Humber," by Mr. ROBERT BROWN, jun., F.S.A. (London: ELLIOT STOCK), supplies much information concerning the town and district at a remote time. Mr. BROWN believes that a Christian church was likely to have been erected at Barton about A.D. 670. But it was probably destroyed during the Danish invasion, 867-70. If a second church were erected on the site it would also have been demolished by the Danes towards the close of the tenth century. Concerning the existing building, he says:—

> I would place the erection of the elaborate existing tower, with the exception of its uppermost storey, at some time in the great and prosperous reign of Cnut, A.D. 1017-35, whose side was taken by the men of Lindsey, A.D. 1014. The date A.D. 1020 appears to me, on the whole, as the most suitable and probable. There was neither then nor subsequently any special fear that the church would be destroyed by violence; and the work then so well performed remains our heritage and our pride to-day. The uppermost storey of the tower shows certain indications of a somewhat later period, and there is also a Decorated window on its western side. Originally all the top-storey windows were very early Saxo-Norman work; but this does not necessarily mean that they were built subsequent to the Conquest. Much Norman work was done in England during the reign of Edward the Confessor, and it is to the period A.D. 1050-60 that I should assign the topmost storey of the tower.

CNUT, after the time he became a Christian, was a resolute son of the Church, and he even made the pilgrimage to Rome. He was alike anxious for the suppression of the heathen rites in which he once joined and the promotion of Christian worship. He would, therefore, be likely to aid if called on in the erection of a church at Barton. West of the tower is a small building which has been described as a baptistery. The tower is supposed to have formed the original church. But Mr. BROWN considers there was a second annexe on the other side of the tower, and the tower with the two served not only for worship but as a residence for the priest and as a storehouse for any valuables belonging to the church or people. "The elders of the town would sit in the annexe, while the general gathering would occupy the ground floor of the tower, just as on special ecclesiastical occasions the clergy would occupy the presbytery, wholly or in part, whilst the laity, or some of them, would occupy the tower." Much industry has been exercised by Mr. BROWN in collecting information concerning the district surrounding Barton-on-Humber. The first volume comes down to 1154. The condition of Lincolnshire corresponded to some extent with that of other parts of the country, and the work, when completed, is likely to form an important addition to archæological literature.

That "science is measurement" is exemplified in the electricity meter. The power on which so much depends is neither a solid, a fluid nor a gas, and yet it has to be determined with an exactitude that is not required in dealing with more material agents. So many varieties of meters are to be found, it is almost impossible to describe them all within the compass of a volume. In his treatise on the subject, which is published by Messrs. CHARLES GRIFFIN & CO., LTD., an endeavour is made by Mr. HENRY G. SOLOMON to embody the latest improvements as exemplified in British, Continental and American types. When we find that there are over 300 illustrations, the variety of inventions for measuring the supply and expenditure of electric force is suggested. As a rule, meters do not last long, for there is a strain on the delicate works, and therefore there are continued opportunities offered for improvements. The Government allowance for errors is from $2\frac{1}{2}$ to $3\frac{1}{2}$ per cent. The number of different types which

Digitized by Google

have received the approval of the Board of Trade is accordingly rather limited. As examples of mechanism meters in general will bear close examination. No other aid to measurement requires such manipulation. One of the most interesting applications of meters is for what is known as the Hallé tariff system devised by Herr JUNG. The tariff is as equitable towards shopkeepers and occupants of private houses as towards consumers on a large scale. Mr. SOLOMON gives the following example of the working of the system, by which a high rate per unit is charged up to 300 hours, and afterwards all units come under a low price :—

Taking a house, for example, in which sixty lamps are installed, and in which the maximum number in regular daily use is six, the hour meter is set to register with three lamps, so that the consumer will reach the hours required with three lamps in use. He can, if he so desire, obtain his current at a relatively cheap price by keeping only three lamps burning during the 300 hours. Afterwards, for the remainder of the financial year, he can burn more or fewer than the three lamps, as he is then no longer bound to any number. The consumer has, therefore, only to watch the hour meter until it has reached the 300 hours. As the hour meter is in each case set to half the recurring maximum daily used by the consumer, each consumer will obtain current at a low price, provided his yearly use of current extends for longer than the 300 hours. If a consumer does not reach the 300 hours during the financial year, he has to pay for all the units he consumes during this year at the high rate. A case of this sort rarely, or never, happens, as the 300 hours are reached by all the different classes of consumers. For instance, offices take current during the year for about 400 hours, shops for about 700 hours, hotels and public-houses for about 2,000 hours, and private houses for about 1,200 hours. Power consumers who take current daily for one hour and longer also reach the 300 hours, as in their case, too, the hour meter is set to half the maximum horse-power in regular daily use (not half the maximum installed), and the average horse-power is above this amount. The results obtained with this tariff are very satisfactory, and it has the advantage of simplicity and of being easily understood by the average consumer.

For everyone who employs electricity, and has therefore to select a meter, Mr. SOLOMON'S book will be serviceable, as the economy of the power depends in a great degree on the quality of the meter that is used. It is a useful addition to the publishers' valuable series of standard technical works.

The first volume of the work on "Modern Buildings: their Planning, Construction and Equipment," which is edited by Mr. G. A. T. MIDDLETON, has been brought out by the Caxton Publishing Company. In the arrangement an excellent system has been adopted. The student cannot be terrified on starting by endless details about the mathematical theory of construction or the no less involved history of ancient architecture. What may without offence be called the Squeers System, the practical mode of teaching, is adopted. No sooner is the student initiated into office practice and draughtsmanship by the first chapter than he is shown how he can apply his skill in the planning of country houses and cottages, and in ordinary constructional details. Readers who might be disposed to abandon architecture from a conviction that they were never likely to be employed in designing an Egyptian temple or a wonderful wooden roof like that of the Riding School at Moscow, will find that they can become useful in aiding the carrying out of work of a more modest sort. Buildings and the details of their construction are so closely connected in the pages as to appear identical, and that is a conclusion which students often fail to draw from other books which profess to treat of building, designing and history. Mr. MIDDLETON has been able to obtain examples from living architects of cottages and mansions, and the book is therefore suggestive of practice that is absolutely modern and English. Whether in the end the work will be above or below other treatises we need not inquire. But we know of no book in English which is likely to be so efficacious for those who wish to learn the shortest route to the knowledge required in ordinary practice. The editor has worked hard to make it deserving of success.

"Dilapidations" has been as successful as any of the other text-books by the late BANISTER FLETCHER. The sixth edition, which, like the others, is published by Mr. BATSFORD, has been practically rewritten, so as to bring it up to date, by Messrs. FLETCHER, and if our memory is not at fault the work has been vastly improved. The "questions and answers in points of practice" is now a more varied chapter, and helps to give actuality to other pages. A book of this kind should not be confined to the use of architects and surveyors. Occupants of houses as well as owners should employ it as a guide, for many costly law suits would be avoided if the information given in the pages was more generally diffused. It is not too technical for ordinary people to comprehend.

SOCIETY OF ARCHITECTS.

THE following are the regulations and conditions for the competition for the architectural scholarship. Candidates for the architectural scholarship shall be persons who are not more than nineteen years of age at the date of the examination, and who are receiving, or are desirous of receiving, a course of architectural training preparatory to their eventually adopting the profession of an architect. There will be a competitive examination in the form of an essay on architectural history, and a freehand drawing, held in London on May 10, entries for which must be made before May 1 on a form to be obtained of the secretary. No entrance fee is required. The award will be made by the Council subject to its approval of the manner in which the candidate proposes to utilise the scholarship, or alternatively to the candidate agreeing to such scheme as the Council may decide upon. The successful candidate will be required, before the award is confirmed, to produce to the Council evidence as to age, and make application for admission to the register of students. Should the holder at any time during tenure cease to be a student of the Society the scholarship will lapse.

The scholarship is of the value of ten pounds (10*l.*), and is tenable for three years, subject to the Council being satisfied from year to year with the progress made by the holder as set out in a form to be used in making application for renewal. The Council will disburse the scholarship on behalf of the holder, and should the scheme not call for the payment in one session of so much as ten pounds (10*l.*), the holder may receive the value of the balance in books or instruments.

The subject for the design competition of 1906 is a small country house of such accommodation as can be comprised in a cubical capacity of 60,000 cubic feet, the price allowed being 1*s.* per foot (3,000*l.*) measured from bottom of footings to half-way up roofs, excluding dormers and chimneys.

Drawings required are a complete set of working drawings to ¼-inch scale, comprising plans of each floor and roof, sections, elevations, block plan (one-sixteenth-inch scale) showing drainage, and ½-inch details of hall and staircase and portion of front elevation. The materials proposed to be used to be noted on the drawings. The drawings are to be of such a character as would be required by a contractor to carry out the work, and are to be executed on not less than half double-elephant size sheets, mounted on strainers or millboard.

Candidates for the travelling studentship shall be persons whose names are on the register of students of the Society, and who have paid their subscriptions for the current year. The maximum age limit is 28 years. The competition drawings, upon which the studentship will be determined, must be delivered at the Society's offices not later than May 1, without name, motto or other mark of identification, and must have attached thereto a sealed envelope containing the competitor's signature and address appended to an attested declaration that the drawings are the candidate's unaided work.

The studentship is of the value of 25*l.*, and carries with it the silver medal of the Society. It will be awarded annually, the holder being required to undertake, between June 1 and October 1, a sketching tour of not less than

Digitized by Google

three weeks duration. The successful candidate must, within fourteen days after the award, notify the secretary of the date of the commencement of the tour and its proposed locality, and will then receive the sum of 15*l.* A diary of the tour must be submitted with the measured drawings, sketches and notes, all of which must reach the secretary before October 1. Subject to the Council being satisfied with the work executed during the tour, a further payment of 10*l.* will be made, and the silver medal presented to the candidate at the first ordinary general meeting of the session. The right to reproduce the drawings is vested in the Council. The studentship may only be held once by the same person. A candidate who does not adhere to the conditions in every particular will be disqualified.

WINCHESTER CATHEDRAL.

A WINCHESTER correspondent who has obtained from authoritative sources details of the present condition of Winchester Cathedral, writes to the *Morning Post* :—

The reports which have been circulated during the past nine months concerning the ancient cathedral of Winchester have naturally directed public attention to the condition of this noble fabric and its venerable history. Alarming as have been the statements made, they have only served to point out what needs to be clearly emphasised, viz. that very serious trouble exists, and that its full extent cannot be ascertained at present. Fresh revelations are forcing themselves at every turn.

The fall of a portion of one of the spandrils perilously near the Waynflete Chantry last week was not anticipated by anyone, though it is well within the zone of the affected part. One writes "affected part" because it conveys to the mind that portion which is now a mass of timber supports, but really the cathedral is in such a thoroughly bad state of repair from end to end—excepting the nave, which Dean Stephens restored at a cost of 12,000*l.*—that it is difficult to point to any portion which is not really "affected." There are cracks everywhere ; there are deflections from the perpendicular at almost every turn ; the nave aisles leak and show signs of increasing decay ; the west front is in such a bad condition that a timber protection has had to be erected to prevent any member of the public from being injured by falling stones ; and the east end conveys the impression that it is weary of having stood for so many centuries and is desirous of detaching itself from the rest of the building. The whole trouble is the result of neglect in the past—neglect on the part of the custodians of the cathedral a hundred years ago, when the revenues were princely against what they are to-day.

The work which is now in hand was not taken up a moment too soon. On the best authority I am able to state that had the shoring-up of the building been delayed for another month or two in all probability the eastern end would now have been a heap of ruins. That would have been a thousand pities, for the portion in danger is one of the finest specimens of Early English work to be found in the kingdom. It was built by Bishop Godfrey de Lucy (1189-1204), and it is strongly characteristic of the age in which it was executed. The beauty of the details are undeniable, and one writer asserts that they influenced Richard Poore to use them as models when designing Salisbury Cathedral. De Lucy's object in enlarging his cathedral church by the addition of these eastern aisles and lady and other chapels was to provide space for the pilgrims who resorted to St. Swithun's shrine, which was placed in the centre between the Waynflete and Beaufort chantries. It was carried out by a confraternity of workmen, who were ordered to complete their labours within five years. Whether this restriction of time induced the builders to hurry their work unduly it is difficult to discover, but it is pretty evident that not enough attention was paid to the foundations. This part of the structure is said to be built upon piles, though at present, with the exception of an instance or two, piles have not been discovered. The whole of the ground, however, is not unstable. Peat on marl is the underlying weakness, and the peat, as disclosed by the excavations, is sodden, though not so much as in the days of De Lucy, for some of the present mischief has been caused by the drainage of the area. Gravel is found at 24 feet and continuous pumping has to be carried out.

The progress of the work is slow. A powerful engine pumps water at the rate of 20,000 gallons an hour, by which the 14 feet of water is reduced to two, but it is curious that this has little effect on the water a little distance away, and that the water in the crypt still maintains the level at which it has been for the past month. Underpinning is gradually going on. It is being carried out in 4 feet sections amid difficulties which are nothing short of colossal. Dangerous as is the process, it is not anticipated that there will be any other result than permanent security, though some experts in the locality are finding fault with this method of saving the structure. One finds an increasing volume of opinion in favour of following the Peterborough precedent of pulling down the structure, marking the stones and rebuilding the cathedral. Mr. T. G. Jackson and Mr. J. B. Colson, the architects engaged on the work, are, however, of opinion that underpinning will effectually achieve the purpose in view.

The fractures which have been disclosed are very serious. The most extensive is that which runs through the fabric from north to south, breaking, as it were, the backbone of the building. As Lord Grimthorpe found at St. Albans, the more the building is repaired the greater are the troubles that arise. Rottenness exists in the most unexpected quarters. Obviously the Grimthorpe method of dealing with this would be to pull down and build something else, but that would sadly interfere with the story which the historic stones speak. When the work at present being carried out was contemplated 11,000*l.* was the estimated outlay. Already about that amount has been received, but fresh complications soon doubled the 11,000*l.* required, and now 30,000*l.* will not be a halfpenny too much, even if it suffices. It would be perfectly easy to spend 100,000*l.* on the fabric and then not completely restore it. The remarkable aspect of the present work is that whatever is spent will be buried beneath the soil, and not a farthing of it will be seen above ground. Every precaution is being taken to preserve the building, and especially the beautiful chantry tombs of Waynflete and De Blois and the various monuments. After this work has been accomplished the west front must receive attention and then the aisles of the nave. The troubles of the Dean and Chapter are manifold, but they are hoping that a generous public, who would earnestly wish for the preservation of one of our most famous national monuments, within whose walls rest the dust of the Saxon kings, will rise to the occasion and relieve them from the heavy burden which they feel is already of too great weight upon their shoulders.

On Monday morning, by invitation of the Dean of Winchester, the Mayor and Corporation of the city visited the cathedral for the purpose of inspecting the works now being carried on. The Dean received the visitors in the south transept and afterwards in the chapter-room explained the trouble which had arisen in connection with De Lucy's part of the cathedral. He said that when the foundations were examined it was found that the fabric was resting upon no really adequate support, having been built on a comparatively thin stratum of chalk and marl. It was evident that the early Norman builders did not understand how to deal with difficulties of water. When they began the work on the south side they found to their great disappointment that the gravel dipped at that point, and instead of being at a depth of 16 feet it went down to 24 feet, and that meant so many more feet of water to contend with. It was hoped that the gravel bed, which rose sharply within a few yards, would be maintained, and that the west end of the cathedral would be built upon solid gravel without water. He was afraid that they had wasted time, money and labour in trying to deal with the water, but now that they had a steam-pump 14 feet of water was reduced to 2 feet in a quarter of an hour. That enabled them to proceed more easily with the work. The effluent was quite clear, which showed that they were not drawing mud from the foundations. They hoped to finish underpinning the south-west corner this week. They had decided that they must underpin the north side, the wall of the south side of the presbytery and the east wall of the south transept. All the cracks they had found had simply been hidden from view by mortar placed there by a predecessor, who made no effort at all to deal with the source of the mischief. The fall of a portion of the staindril last week was a symptom of grave importance, because it fell without adequate provocation, and that made him uneasy as to the stability of the east end of the cathedral. Their previous estimate had now increased to 30,000*l.* The Dean then conducted the visitors around the works and explained the whole of the trouble, and a conference took place with the object of dealing with the water difficulty in the Close, experiments with which are being conducted at present

CAPETOWN LAW COURTS COMPETITION.

THE following "special survey" of the designs for the new Law Courts, Capetown, appears in the local *Owl*:—

However the present exhibition at the drill hall of the designs for the new Law Courts may strike the ordinary observer, from the professional point of view there can only be one verdict, and that is that as a whole they reach a very poor level of excellence. Here and there a plan or an elevation stands out in pleasing relief from the general welter, but always solitary, and the palm has been secured not so much by any design of super excellence as by the author who, like Wellington's general, made the fewest mistakes.

From the purely technical point of view the forty-three designs were very uneven, the draughtsmanship ranging in the widest manner from wash and line of considerable merit to sketches calculated to make one marvel at the good fortune of the competitor in being adjudicated upon at all. In the perspective sketches especially, with the restraints of black and white removed, full rein has been given to fancy, and one or two of the sheets display an orgie of colour that recalls the earliest days of the impressionists.

But to return to the designs. We believe that we are voicing the sentiments of the majority of the competitors in considering the competition as a whole to have been a satisfactory one—in pleasing contrast to some others we might mention—and the Colony to have secured the best design for its seat of judicature consistent with the conditions imposed and the limitations of price laid down.

The winning design (see *The Architect*, February 23, for illustration) in one respect differs radically from the majority of those sent in—it is quite simple. The elevations, if not very ambitious, are quiet and dignified, and study of the plan is a pleasure after worrying through the intricacies of the majority of those sent in. The designer has evidently kept in mind the old adage, "Ars est celare artem," and this apparent simplicity is really the outcome of a full grasp of the limitations of the site, coupled with a thorough acquaintance with legal requirements, and must have been the result of long and careful study. He places his main entrance to the four courts in Keerom Street, an arrangement which seems to have solved the problem of keeping witnesses, &c., away from the official portion of the building, in which he differs from all the other competitors. It opens on to a spacious hall, around which are grouped the courts themselves and the rooms for the various witnesses, the vexed question of the coloured people (which proved a stumbling-block to many) being very ingeniously got over by placing them in the basement, immediately below the white witnesses, thereby keeping them apart, while at the same time in close proximity to the courts. The courts are spacious, well lighted and ventilated, and convenient of access to judges, barristers, attorneys and witnesses alike. The judges' rooms are arranged along the Queen Victoria Street frontage, with a separate entrance from the street, and overlooking the Botanical Gardens. The barristers and attorneys' rooms are placed down the sides and along the Keerom Street front, providing the fullest accommodation. The barristers have a private entrance of their own at the side nearest the City Club. The law library is very conveniently placed between the judges and the barristers. The offices of the registrar of the Supreme Court are also arranged for on this floor, with entrances from both sids of the building. On the lower ground floor are situated the insolvency and orphan chamber branches, with the insolvency court, located in the wings of the building, with separate entrances to each from Queen Victoria Street, and a clock tower of fine proportions crowns the whole edifice.

While nothing very striking has been achieved, still the design from the practical point of view leaves nothing to be desired, and the authors are to be congratulated upon their success.

The design placed second is of a radically different nature, the main entrance being from Queen Victoria Street, with a huge portico extending over the pavement. The elevations are modern, but tinged with almost an Oriental feeling. As to the plan, the courts are well placed and carefully lighted and ventilated, but its general conception is inferior in many respects to that of the winner.

The third design has been planned with considerable care, and the elevation from an architectural point of view is perhaps the best that could be chosen. It is of a refined and severe character, admirably suited to the purpose of the building.

Of the other designs much could be said, but we will confine ourselves to a few brief remarks. No. 12 shows an original plan with octagonal courts very successfully worked out, and the elevations also are very pleasing. No. 40 shows considerable originality in the matter of the elevations, but fails lamentably in the planning. There is a beautifully worked perspective, but the style as a whole is unsuitable for a law court, and would be more applicable to a municipal building. No. 25, apart from the winner, is the only one to hit upon the idea of having the main entrance in Keerom Street for the general public and the witnesses, but the plan betrays want of care, and has every sign of having been rushed through at the last moment. No. 36 also shows a striking perspective, and No. 37 is beautifully got up, but the plan is very wasteful. Nos. 42, 18, 20, 22, 24, 25 and 34 are worthy of notice for various reasons.

In conclusion, all the drawings show signs of great care, time and labour, and with a few exceptions tend to show that the architectural profession in South Africa is well in touch with the most modern developments in design.

EDINBURGH CASTLE.

BY permission of H.M. Office of Works the members of the Edinburgh Architectural Association are allowed to visit Edinburgh Castle to-morrow.

The castle was a stronghold of the king of Northumbria in the seventh century. It was surrendered to the Scots in 960, and was long known as the seat of a religious house, with the right of sanctuary, of which it was finally deprived in 1714. No trace of monastic buildings is now known to exist. Towards the close of the eleventh century Malcolm Canmore and his queen, Saint Margaret, came to occupy the castle. The chapel, or oratory, which still bears Queen Margaret's name, is the oldest building of the castle group now remaining. The period assigned to it is about 1090. With the accession of David I. in 1124, the castle became more recognised as a royal residence; but during the next fifty years no special works appear to have been executed in it, and for twelve years afterwards the castle was an English possession.

Considerable works in repairs and extensions are recorded to have been carried out during the reign of Alexander III., after whose death the castle was again possessed by the English under Edward I., who destroyed its records and dismantled it. It was refortified under Edward III., who was driven out in 1337. David II., in 1341, carried out extensive works on the castle towards making it a great stronghold. "David's Tower," and the Gate, or Constable Tower, were erected at this time, and a large garrison chapel was also built. In 1434 the great hall, in which Parliaments were frequently convened, was erected. This hall seems to have become dismantled, because in 1500 an extension, forming the present hall, was built. It bears many very interesting carved symbols associated with James IV. and his queen.

On the east side of the square are the palace buildings, part being of the sixteenth century and part of the seventeenth century. Remains of what are supposed to be the foundations of David's Tower exist to the north of the palace buildings, under part of the Half-moon battery, which was constructed after the siege of 1573, when David's Tower and the Constable Tower were both dismantled. The Constable Tower, now known as the Argyll Tower, from the chamber in it having been occupied by the Marquis of Argyll on the evening preceding his execution, is part of the restoration due to the munificence of the late William Nelson. Under the great hall are the kitchen and the chambers in which French prisoners were confined in the early part of last century.

ELECTRIC LIGHTING AND POWER IN A PUBLIC INSTITUTION.

By F. T. WARDEN-STEVENS, A.M.I.M.E., A.M.I.E.E.

THE lighting of a large public institution, consisting of various departments and several blocks of buildings, is a question requiring very careful consideration and supervision, especially when particular circumstances have to be dealt with, as in the case of a hospital, workhouse or asylum. The provision of power for various purposes, such as driving laundry, bakery and workshop machinery, ventilating fans, pumping, &c., also is of considerable importance in view of reliable and efficient results. The

Digitized by Google

writer having given attention to these questions felt that some information would be of interest, and therefore has decided to give particulars relating to a special case in which he has planned and supervised the arrangements for lighting and power; this he ventures to believe can be considered as a good example of modern practice in large public institutions.

The buildings under consideration consist of twelve blocks and cover an area of over four acres, there being connected with the institution a steam laundry, bakery, chapel and workshops.

The electric lighting system consists of three feeding cables, the largest of which is equivalent to half a square inch area of copper. These cables pass to three points equidistant from the junction of the corridors and about halfway from the centre to the furthest point; connecting these three points is a complete network of concentric lead-covered distributing mains which allow each block of the buildings to be reached in one of two ways. The various cables being connected together in above-ground connection boxes, any length of cable may be disconnected and tested or repaired without in any way interfering with the general supply. All staircase and corridor circuits are, on account of their importance, connected separately to the mains so as to render them independent of the general supply.

Each block of buildings is provided with a main distribution box, which contains a 15-ampere fuse for each circuit, and each of these circuits is connected directly to a subsidiary distribution box controlling not more than 15 amperes in 5-ampere circuits. By this means it is practically impossible for more than a small proportion of the lights to be out at one time due to a defect in the wiring, as a fault can only cause one 15-ampere circuit fuse to collapse out of several circuits which supply the particular block. Further, there are only two sizes of fuses—15 and 5 ampere—each connected to differently constructed porcelain carriers, so no mistake can be made.

There are twelve connection boxes, each consisting of two enamelled slate slabs fixed to battens and enclosed in a watertight iron case with lock; on these slate bases are supported the fuses. The main distribution boxes—fourteen in number—contain the 15-ampere size fuses, which are double pole and of the spring-clip type; they are mounted on slate bases and enclosed in lock-up watertight iron cases; these cases are of ample size to allow of all connections being at the back of the slate bases, which are filled in solid with waterproof compound to prevent the entrance of moisture where the cables are admitted. The subsidiary distribution boxes—eighty in number, containing the 5-ampere size fuses and local controlling switches—consist mostly of lock-up teak cases lined with sheet copper. They have double bevelled plate-glass doors, one of which gives access to the fuses and the other to the switches, and are provided with special latches so that both doors cannot be open at the same time.

The whole of the wiring has been carried out on the "looping" system, with lead-covered concentric and twin wires, and there are no joints except at switches or behind fittings, and no fuses except in distribution boxes. There are in all about 1,400 incandescent lamps, 500 switches and twenty enclosed arc lamps.

Where the fittings are pendants, these consist mostly of plain enamelled iron tube, which are more mechanical than the ordinary flexible cord pendant. The lamp-holder is screwed to the tube, and the upper or suspension end of the tube is provided with a hook to attach to a ring on the ceiling rose. This allows of movement of the pendant, and avoids damage which might result if the pendant were rigid. Special provision has been made with regard to the fittings as well as the wiring where exposed to damp, such as in the case of the lavatory and outside lights.

Electric power is utilised as follows:—The laundry shafting is driven by a 12 horse-power constant speed enclosed electric motor, and the bakery by a 8 horse-power open type electric motor. The principal difficulty was the fact that in the former case the power was required amongst other purposes for centrifugal driers, and in the latter for a dough-kneading machine, in both cases a very large effort being necessary to set these machines in motion. The motors used in both cases are of a special design, being "back compounded," in which the shunt coil is assisted by a series coil to provide a heavy starting effort with a not excessive current. When the whole of the resistance is cut out the series coil is short-circuited. On the next and last stop of the switch the connections of the series coil are reversed, and by opposing the shunt coil and weakening the magnetic field at heavy loads absolutely constant speed is attained.

In addition to these, motors of 20, 14 and 7 horse-power, amongst others, have been provided for driving deep-well pumps, auxiliary pumps for boiler supply, fire, &c.

The motors are supplied by an independent cable, and are controlled locally by switch gear for each, fixed on an enamelled slate panel enclosed in a lock-up iron case; this gear consists of a time fuse arranged to collapse if the current exceeds 50 per cent. of the maximum for more than one minute, a double pole main switch with adjustable contacts and a starting switch and resistance, also in some cases an ammeter.

Electricity is also utilised for heating irons in the laundry and tailors' workshop, and for hot plates in the dining hall, as well as for several small electric ovens or grillers.

Electricity is generated by three sets of plant consisting of:—(1) A vertical compound enclosed steam-engine of 55 horse-power, direct coupled to a multipolar shunt-wound dynamo; (2) and (3) two 30 horse-power steam turbines, connected through speed-reduction gearing to double armature shunt dynamos. A special point in favour of turbines is that they require less space than engines of equal power, and no foundations are necessary, the motion being rotary and not reciprocating. Also there is no trouble with oil in the exhaust steam, which is utilised for hot-water supply. Both the engine and the turbines are capable of working either condensing or non-condensing.

Steam is supplied to the engine and turbines from two Lancashire boilers, each of which is capable of supplying 5,000 lbs. of steam per hour at 120 lbs. pressure. These boilers supply also the steam required in the laundry, kitchen and elsewhere in the institution.

In addition to the steam dynamo electric plant there is a battery of storage accumulators consisting of sixty cells and capable of supplying a current of 200 amperes at a pressure of 100 volts for three hours.

The main control of the supply is from a switchboard situated in the engine-room of the works. This consists of seven panels of enamelled slate supported in an iron framework; each of these panels is subdivided into four. The central panel contains the main voltmeter, the main ammeter, feeder and paralleling voltmeter, and a multiple contact switch; on the one side of the central panel there are three dynamo panels, one for each machine, each containing a double-pole fuse, a double-pole main switch, a regulating resistance and an ammeter; on the other side of the central panel is the battery panel, consisting of fuse, charge-switch, charge and discharge ammeter, patent discharge-switch and automatic reverse current circuit breaker, and two panels contain ammeters and double-pole fuses for four feeding cables—three for lighting and one for power. The terminals and cable connections are all at the back of the main switchboard, and self-contained on each panel as far as possible. There are also two ampere hour-meters, one registering the charge and the other the discharge of the battery, and two meters registering the units delivered for lighting and power respectively.

The engine-room is 28 feet by 25 feet, the floor of which is of granolithic cement, and the walls are faced to a height of 6 feet from the floor with white glazed bricks; this insures cleanliness and tasteful appearance. The natural lighting and ventilation are by dormer windows in the roof, as well as by large windows on one side of the room. The accumulator-room adjoining is 42 feet by 9 feet, and is 15 feet high. Special provision has been made to insure against the deleterious effects caused by sulphuric acid being spilt or the spray and fumes that arise from the cells. The walls are lined throughout with glazed bricks, the floor is asphalte, and all iron and woodwork is coated with acid-resisting paint. Ventilation is amply provided for by inlet and outlet air bricks and dormer windows.

As regards costs, these amount to about *2d.* per unit for lighting and 1½*d.* per unit for power, taking into account capital charges as well as cost of maintenance.

The Northern Architectural Society announced at the last meeting the award of the assessor in connection with the R.I.B.A. intermediate examination testimonies of study. The first prize was awarded to Mr. Wilfrid Turpin, Sunderland, and the second to Mr. J. H. English, of Corbridge. During the evening the Glover bronze medal was presented to Mr. Bryan Watson. A paper was read by Mr. J. B. Mitchell-Withers, of Sheffield, on early eighteenth-century architecture.

NOTES AND COMMENTS.

MR. A. MORAY WILLIAMS, of Bedales School, near Petersfield, has given particulars of the newly discovered Roman villa at West Meon. The villa stands in Little Lippen Wood on the slope of a hill about half a mile from West Meon Church. The chief features that have been determined at present are a block of six rooms, what is thought to have been a gateway on the east side, a double hypocaust in the south-west corner, and a buttress backing the wall to the block of rooms. What appears to be most interesting is the variety of the pavement. One of the rooms, measuring 10 feet by 32 feet, was paved with red-brick tesseræ. As a sleeper wall underlies the tesseræ at 10 feet from its west end, it may have been divided by folding doors or other partition. The base of a moulded column in its original position, with a coat of red paint still adhering to it, is completely visible, and traces of a similar column opposite indicate a doorway leading to Room 2. This room, which measured 21 feet by 10 feet, was also paved with red tesseræ, but with a border of white ones, and there also are sleeper walls indicating partitions or folding doors. Room No. 3 measured 21½ feet by 11 feet, and was paved with mosaic of a somewhat elaborate geometrical pattern of red, black, white and blue. In the centre there was an octagonal panel, which may have contained a figure, but it has been wholly destroyed. To the right of Room 2 was a room measuring 11 feet by 19 feet, also covered with a mosaic pavement. This pavement is well preserved, and is very beautiful, if only from the fact of its simplicity. It is only geometrical in red, white and black. The pavement has sunk considerably, and perhaps lies over a hypocaust. The other two rooms have not been yet fully excavated. At the south-west corner the hypocaust was 21 feet in length, and consisted of two chambers, each fitted with an apsidal termination. It cannot yet be said with certainty to which type this house belonged. Near the spot was found an abundance of iron slag, which indicates the existence of a smithy. Further excavations will be undertaken in the summer, and the two mosaic pavements already found will probably be permanently preserved. Hampshire was by the Romans made a part of Britannia Prima, and there were several Roman stations in the county, Winchester being one. It is not surprising, therefore, that a villa should be found at West Meon.

THE new spirit of treating light and air cases, which is a result of the COLLS case, is accepted in Ireland as well as in England. An example was afforded on Saturday last. A maker of ready-made clothing found that his premises, including workshops, were darkened by a large pile of offices which had been erected for an assurance company at a cost of 64,000*l*. There was apparently no doubt about the obstruction, and in the old days an order would be granted for restraining the nuisance by diminishing the height of the building. Mr. Justice BARTON, who heard the evidence, said there was no doubt about the existence of an actionable nuisance. Without expressing an opinion, he thought that by facing certain walls with white brick there might be an abatement of the nuisance. But his Lordship declared he would not make any decree in the form of a mandatory injunction to compel the defendants to pull down the building, although that was the form in which he would make it if he was satisfied that it could not be obviated, but he was not so satisfied. The decree he would make would be a limited decree. The defendants would be restrained from maintaining the building in such a condition as to continue the nuisance. The decision of Mr. Justice BARTON deserves some attention, for it may be assumed that in other places where there is a probability of interference with light the use of white bricks would not be without influence on judges. In the case in question it will not be necessary to take down a costly building or to expend a disproportionate sum of money as compensation, although formerly one or the other method could not be avoided.

IT is often said when accidents arise in New York that the laws relating to building are too lax, and the superintendence too careless. The Board of Aldermen have therefore decided that a new code is to be prepared for all matters relating to the construction, alteration or removal of buildings. In addition to the members of the Board, who will form a special committee, several experts are to be engaged. They will consist of a builder, an ironworker, a mason, a carpenter, a plumber, an architect, a civil engineer, a sanitary engineer, a physician and a lawyer, who, after they have rendered their services, will receive such compensation as will be determined by the Board. If the amount of knowledge which is demanded should be considered as a standard, there should be more than one architect invited. As much may be said about the necessity of having more than one contractor. The two classes of experts would be sufficient to deal with all matters relating to the construction of the buildings, and therefore the necessity for representatives of the working man is not evident. But we suppose it was policy dictated the choice. Security against fire should be likewise considered, but no fire expert is to be called in. Manifestly the choice of members is inadequate.

ILLUSTRATIONS.

VILLA CASTENHOLZ, INSEL OBERWERTH, COBLENZ.

WE publish this week another of Herr BOCK'S residences at Coblenz. The villa is isolated, and each side presents a different appearance. As we pointed out last week, the views of the country and the Rhine are charming, and it will be observed that opportunities are provided for the occupants to enjoy them. Although planned as a modern residence, there are features in the building which suggest that it belongs to a district where feudalism was at one time supreme. The emphasis on the vertical lines partly produces that effect. In this case also novelty has been secured without any sacrifice of commodiousness.

DESIGN FOR SCREEN, MELTON MOWBRAY CHURCH.

THE new chancel screen recently placed in the parish church of St. Mary at Melton Mowbray is the work of Messrs. JOHN THOMPSON & Co., of Peterborough, from the design of Mr. J. OLDRID SCOTT, F.R.I.B.A., and cost 580*l*. It is remarkable for wealth of detail, harmony and lightness of construction, and adds much richness to the chancel of this beautiful church. The venerable building is considered one of the finest in the Midland counties, and RICKMAN recommended it as worthy of careful examination. It is a cruciform erection of stone, consisting of chancel, nave, aisles, transepts, western porch, and a stately embattled tower with octagonal turret, pinnacles, and a dwarf spire containing a clock and ten bells, with a carillon machine playing a tune on the bells at certain intervals of time. The edifice was probably commenced to be built about the year 1250, but as it was progressively reared the architects appear to have altered their plan, and, instead of having the chancel as at first designed, converted it into a Decorated one. The latter is of a date as late nearly as that of the porch, which appears to have been built from 1310 to 1320.

PORCHES AND APPROACHES.*

(Concluded from last week.)

AMONG English Gothic porches, none, of course, can touch the great western portico of Peterborough Cathedral. Indeed, notwithstanding its comparative plainness and simplicity, it is at least as much greater artistically as it is physically than the porches of Chartres. The architecture of the Middle Ages cannot show its equal in Europe, and one must always regret that the genius who conceived it is robbed of a just fame by our ignorance of his identity. Unfortunately, if we looked for other English Gothic porches that anyone could think of comparing with the French ones, we should be driven to rely on the Galilees of Ely and Lincoln. We could justly claim that they owe their beauty, not to the profusion and the intricacy of ornament on which the French examples largely depend, but to the more solid architectural qualities of restraint in design and an almost Greek refinement of details, especially of the mouldings (the French masons never touch the English in their mouldings). The difference is typical of that between French and English Gothic as a whole, perhaps of that between the characters of the two nations. We should have to confess, on the contrary, that the chief beauties of these two porches are almost lost to the casual observer by being hidden in somewhat dark interiors. That is possibly due to our climate suggesting more strongly an enclosed porch. But it seems typical, too, of our national tendency to seize on a slight practical advantage as an excuse for avoiding display. We call it common sense; but when it is not parsimony it is generally merely the nervousness of a touchy pride which fears criticism. Of our other cathedral porches the most worthy seem to me to be the triple porch at Salisbury, the south transept porch at York and the south porch at Gloucester.

We can show no English examples richer in sculpture than the south porches of Canterbury and Gloucester cathedrals. And in those cases it is all modern restoration. But supposing it to have been originally equal to, or better than, the best French work, and admitting that at Gloucester it is placed and arranged with admirable taste and judgment, it can never have made these box-like structures worthy entrances to great cathedrals. At Canterbury the architectural lines and proportions are quite uninteresting, if not actually bad. And although at Gloucester the reverse is the case, and the work may justly claim our admiration as a very fine and typically English example, it does not rise much above the level of innumerable parish church porches all over the country. The grand three-storey south porch of Burford Church, Oxfordshire, the south porch of Beccles Church, Suffolk, and the well-known south porch of St. Nicholas, King's Lynn, which all belong to much the same period (called in the guide-books the Perpendicular), must have been very nearly as rich and beautiful before their images were destroyed. The north porch of Thaxted Church, Essex, though less sumptuously ornamented, is better proportioned and more satisfying to one's architectural instincts than either.

The south porch of the same church is also interesting on account of its great projection which allows of entrance arches as well as windows in the sides. The south porch of Boxford Church, near Sudbury, is another very fine example of the same period, though only one-storey high. If one were seeking to classify Late English porches, all these, except the Beccles example, might be distinguished by the cornice and parapet forming a low-pitched gable. Whether that means a rather earlier date or only another type does not, perhaps, much matter. But in the eastern counties, with which I am best acquainted, most of the numerous porches that date from the latter half of the fifteenth century are finished at the top by horizontal lines. The south porch of Southwold Church is typical, and perhaps the finest example of a class which is very common all over the coast country of Norfolk and the north of Suffolk and far inland on the borders of the two counties. These porches would be effective in any case on account of the fine proportions of the whole and of every part. But they owe their richness to the peculiar form of decoration employed, which is produced by letting very thin flakes of black flint into the surface of flat stonework. All the panelling, the tracery, the letters and monograms are formed in this way. The flint flakes are chipped away from the back to form a knife-like edge, which can then be trimmed to shape, and the hollows in which they are set are so shallow as to be scarcely perceptible where they have fallen out. But, owing to the contrast of colour, the effect, so long as they remain, is nearly equal to that of pierced work. The same decoration is applied to other parts of the buildings, particularly to plinths and parapets and the spaces between clerestory windows, but that is another matter. Very beautiful two-storey church porches of a somewhat earlier date are to be found at Northleach, Gloucestershire, Leverington, Norfolk, and St. Margaret's, Leicester, among other places. The porches without an upper storey are usually less effective. But there is a very fine one of the middle period at St. Mary's, Beverley, which is illustrated in Rickman; and some of the early thirteenth-century ones, now ruined, such as those at West Walton, Norfolk, and Higham Ferrers, Northampton, must have been exceedingly rich internally. The porch of the Temple Church in London is unique, to the best of my knowledge, and forms a class by itself. The typical Late English church porch of the larger sort must be referred back for its type and origin to such Norman examples as the north porch of Southwell Minster.

But there is also among village churches a common class of wooden porch of late date which seems to have arisen from the addition of what one may call screenwork to the timber construction of the village carpenter, with the addition of a moulding or two on the arrises of the timbers. Such porches are usually so ruined that the existence in fair condition of a wooden porch of obviously earlier date is rather surprising, and, if I had not seen the one at Boxford myself, I should have been tempted to put it down to some restorer; the more, since it is such an imitation of a stone porch with vaulting and window tracery complete as one does not readily put to the credit (or discredit) of our forefathers. It is probably unique, it must be badly decayed, and it is to be hoped that some young man, with time for such things, will make a careful measured drawing of it at once before it is either pulled down or "restored."

There is one more English church porch that must be mentioned before leaving that branch of my subject, though it is not Gothic. It is the familiar porch of St. Mary's, Oxford. In the present condition of architectural taste I am tempted to characterise it as the most beautiful of all.

The precincts of all great ecclesiastical and conventual establishments were, of course, walled in, and the approaches guarded by gates or gatehouses having more or less architectural character. A very large number of these remain, especially in our cathedral cities, but the diversity of their forms and characters rather bewilders any one who tries to describe them and entirely precludes classification. Between the grand but heavy and forbidding fourteenth-century gatehouse on the hill at Ely, which I suppose most of us know, and the light and gracious late structure at Worcester, with its panelling and its gallery of windows, there is almost every conceivable form and degree of ornamentation. Both these have level parapets, but gables are more common and seem most appropriate when turned to the front. Occasionally they face the sides, and occasionally both front and sides. A large number have but one opening, or had but one originally (a second has sometimes been made in modern times). A few only had two openings, a larger one for wheeled traffic and a smaller for foot passengers (like the holes for the cat and the kitten which legend says Sir Isaac Newton made in his door). The Worcester gate is the only one I can remember with three. As seems natural and proper, the outside is usually plainer or sterner-looking than the other, though where there is a lodging over the gate, as there more often is than not, there is generally a window on the outside for a look-out. I have chosen the Worksop Abbey gate for illustration, partly as being more or less typical, but mainly on account of its gables, which make a good architectural group, and for the incidental interest of some remains of an old cross just outside the gate. Norwich possesses two gates which are of unusual interest on account of their remarkably rich and symmetrical design. The earlier is the Ethelbert gate, built about the last quarter of the thirteenth century, a really fine piece of work, but much spoiled by an incongruous and absurdly ugly modern parapet of flint inlay. The other, the Erpingham gate, built by Sir Thomas Erpingham, who figures in Shakespeare's "Henry V.," if less vigorous in design is almost as elaborately decorative and is not spoiled by any modern addition. Of an altogether different class and much more formidable were the gates that guarded the approaches to castles and cities of Mediæval Europe. And of these, again, a much larger

* A paper by Mr. F. T. Baggallay, read at the meeting of the Architectural Association on Friday, February 23.

Digitized by Google

number remain even in this country than it is possible to refer to in a single paper. The earliest form of such gates in England is to be seen in the ruins of some of the Norman castles, which were built before any of the fortifications of towns; at any rate, before any that are now left. It consisted of a narrow gateway in a lofty tower, the front of which was made up chiefly of two enormous turrets, circular on plan, flanking and appearing to crowd and threaten the gate, as, indeed, they were meant to do. The tower was, of course, crowned with machicolations and parapets, the base was battered to facilitate the attentions which the owner desired to pay to unwelcome visitors, and the gateway was further protected by an iron portcullis, and, except in very inaccessible situations, by a moat and drawbridge. This form of gate persisted in essential particulars in most city and castle gates, and later, in mansion gateways in England up to the reign of Elizabeth, is to be found even in the seventeenth century.

As time went on the turrets became less important. They were made smaller or placed further apart and the circular form was less insisted on. In the Micklegate bar at York, built about 1300, the turrets are quite small and the lower part is square. At Carnarvon Castle they are polygonal, at Alnwick Castle they are square, at Hurstmonceux, the youngest of the English castles (1446), the turrets are fanciful, octagonal below and circular above, with smaller circular turrets standing up within the parapets.

There are few things more picturesque to be seen by the tourist in some of the unspoiled towns of the Continent than the old city gates. I do not envy the man with a brush, a pencil or even a camera who could see the Haarlem gate at Amsterdam and leave it alone, however often he may have seen sketches and photographs of it before. It may be that there is not really much in it in the way of architectural detail, but it groups splendidly; there is the most delicately-graduated light and shade and there is colour, to say nothing of a bridge and water in the foreground. What more can a man want?

The bridge and the water do make a difference. I doubt if people would think so much of the gatehouse at the bridge-end of Prague, which we often see sketches of, if there were no bridge. Many of the old French and German towns, and especially the towns of Holland and Belgium, can boast gates which in other respects are as picturesque, but we rarely see drawings of them. Germany is especially rich in city gates, and has even some early Renaissance examples, which are, however, more or less heavy, coarse and ugly. Our own charming little Temple Bar is possibly unknown to some of the younger men; it is worth a journey to Waltham to see.

In the last twenty years of the fifteenth century, when the feudal castle gave way in England to what is not inappropriately called the castellated mansion, the general form of the great gate-tower was still retained; but it was pierced with large windows, and the turrets and machicolations and battlements became attenuated and merely ornamental. A type was thus developed which persisted for more than a century. The turrets, two at first, soon became four for the sake of symmetry. They were octagonal in plan, and straight from top to bottom, except for a slight oversail at first where the machicolations used to be. And as time went on they became thinner and thinner, and the space between them wider and wider. Such gate-towers are always striking features; but the earlier examples, before the turrets had become too attenuated, and especially several in the eastern counties which are built of red brick and terra-cotta and have the added advantage of colour, seem to me the most handsome. The Oxburgh Hall gateway seems to be the earliest of these. The date is generally given as 1482, but, according to the present owner, it was not finished until 1489. The moat and bridge and its height (80 feet) give it an advantage over all rivals, unless the more ornamental character of some of the detail in the Layer Marney gateway (built in 1500) be held to equalise matters. In point of date the "Deanery tower" at Hadleigh is between the two (1495). In appearance it suffers from too much neatness and hardness of line, and must, I think, have been trimmed up, rubbed down and pointed in modern times. It is certainly not so picturesque as the ruin of the Nether Hall gate, now standing neglected in a farmyard. The familiar gatehouse at Hampton Court, also of brick, is a little later in date (1515-20).

Most of the stone gatehouses of this type, where they belonged to private mansions, seem to have been either pulled down or greatly altered subsequently. There is an example, though rather a poor one, perhaps never completed, at Montacute Abbey, and a very fine one at Knole, near Sevenoaks, where, however, the turrets are square in plan. The best and by far the richest examples remaining are some of the great gatehouses to the courts of the Cambridge colleges. The great gate at Trinity, begun in 1535, and the outer gates of Christ's and St. John's colleges, begun soon after 1505 and 1510 respectively, are the best. The last two are notable for the fine decorative use made of the arms of Lady Margaret Beaufort, Countess of Richmond, who founded them. The three gates to the great quadrangle at Trinity are all said to owe their present form to Ralph Symmons, who had been one of the architects or designers of the second court of St. John's, and was employed in 1604 by Dr. Nevile, an energetic master of Trinity, to improve his college buildings. But it is unlikely that Symmons much altered the great gate; and King Edward's gate, at the end of the chapel, is said to be an old one which he merely took down and rebuilt on another site. So that the third, or Queen's gate, alone can be properly dated so late as the beginning of the seventeenth century. There is, however, another example of the type in the brick gatehouse of Abbot's Hospital, at Guildford, built in 1619.

The Oxford colleges did not accept the type, but continued to build plain, square, or rectangular entrance towers with only one stair turret, in general outline more like contemporary church towers, but distinguished by great oriel windows over the arch instead of belfry windows at the summit. The best of these is the Founder's Tower, at Magdalen. The only Oxford example I can call to mind of a gatehouse with more than one turret is the sumptuous Tom Tower, at Christchurch, as it was originally built by Cardinal Wolsey.

The cases in which a porch was added to a domestic building of the Late Gothic period, either in addition to or instead of a gatehouse, are rare, and I do not know of any, except the oft-drawn porch at Compton-Winiates, that is worth notice.

The freedom of thought and action which the reign of Queen Elizabeth brought to the nation led, among so many other great changes, to a revolt against the prison-like gloom of the old mansion, the small windows and the enclosed courtyards. People called for light and air and an extended view. They built enormous windows, and in the end they left out the buildings on the entrance side of the courtyard, or reduced them to a screen or even a balustrade, and if any gatehouse was erected at all it was an isolated structure. But before that step was taken the porch seems to have anticipated its coming importance, and even in the earliest Elizabethan mansions was strongly emphasised. The well-known porch at Kirby, attributed to Thorpe on what seems fairly good grounds, is an example. It has been greatly admired and severely criticised. To eyes that are educated in the niceties of architectural detail and propriety it is an unfortunate bit of honest English building, tricked out in a coarse parody of Italian details, put on in the wrong way and in the wrong places. One is apt to find in it a parallel to the finely made savage monarch who, according to report, gets hold of a suit of slop-shop European clothes, puts his legs into the arms of the coat, and his arms into the legs of the trousers, wears the hat round one ankle, and puts a saucepan on his head. Perhaps architects, like men of every trade and profession, are liable to take rather a narrow view, and allow the technicalities of their trade to become too much the masters of their judgment. Yet, as architects, we cannot help feeling that the few porches of this date in which Italian detail is absent (of which that of Montacute House is an instance) are distinctly pleasanter than either the Kirby example or the porches, say, at Audley End, where the Classic orders are used with a good deal more knowledge and discretion. The many porches, too, built at the end of the sixteenth century and beginning of the seventeenth—such as those of Ragdale Old Hall, St. Catherine's, Bath, and the Corsham almshouses, in which a little Classic detail is applied as a sort of spice in the lower part round the door—are quite charming. So are many of the half-timber porches of this and the end of the Gothic periods—such as the porches of Park Hall and Moreton Old Hall, and that of the old Guildhall at Lavenham. English porches of a later date, though the detail may be unimpeachably correct, are apt to be formal, unimaginative and uninteresting. The Westwood porch is a not unfavourable example. The same criticism may, with some show of justice, be applied to the great porticoes which may be found in every town, and which are

Digitized by Google

built in imitation of the porticoes of Roman temples. But the lofty and serene majesty of such a composition, when it is proportioned and detailed with care and knowledge, makes it peculiarly suited to the approach of a great public building, and one would be sorry to lose it in such situations.

When the enclosed courtyard of the late Mediæval mansion was opened out by the omission of the buildings on the side of the gate-tower, and the place of the latter was supplied by a gatehouse, either entirely isolated or forming part of a low screen or connecting corridor, the gatehouse assumed a greater variety of form. The Tixall, Burton Agnes and Charlecote gatehouses still have angle turrets; but at Charlecote the proportions have already become broader and lower, and at Old Toddington and in a variety of other instances the turrets were omitted, and the gatehouse was but one storey high, with a tendency to dissolve into a gateway flanked by small lodges. This is actually the form of the curious and rather ugly example at Westwood, Gloucestershire. But the gatehouse was replaced in some cases by an arched gateway of ornamental character, such as that at Cold Aston Manor, or the curious, elaborate, rather pleasing gateway at Caius College, Cambridge, called the Gate of Honour. Later examples of such gates are to be seen in the old Somerset House gateway now in the Embankment Gardens, London, and the gate to Queen's College, Oxford. Sometimes there was a gatehouse and screen to the main courtyard, as well as an architectural gate-arch or gate-piers to an outer court, as at Rushton. Gate-piers became in the end far more general than the arch, and are usually joined by more or less elaborate and often very beautiful wrought-iron gates and grillwork, rising at the top into a light gable of scrolls and foliage, among which the arms or monogram of the owner are generally introduced. The arms are also frequently to be seen on the outer face of the piers, the finials of which are generally the crest, a vase or a ball. The balls are said by some people to be properly the gruesome emblem of a lord of a manor, since they represent the heads formerly exhibited at their gates by those who had the power of life and death. Some of the best of the innumerable examples of both piers and ironwork are to be seen at Cambridge, at the entrances to the colleges from the backs. There are many good examples, too, even in the heart of London. The gateway to Staple Inn from Chancery Lane and several of the piers on the west side of Lincoln's Inn Fields are examples which occur to me.

I have already spoken twice of the great charm of an approach over a bridge. This, too, is to be seen to perfection in the back approaches to the Cambridge colleges, particularly at Clare and St. John's, where you advance, between handsome balustrades in the one case, towards a vista of courtyards seen through arched gateways, and in the other to the stately gate-piers and iron gate at the bridge-end. I have attributed the charm of bridges in part to the water, but the confinement of the approach between the parapets or balustrades of the bridge has perhaps as much, or more, to do with the matter. Many an old house is approached by a bridge over a moat which is now dry—Speke Hall is an example—and the absence of the water does not entirely do away with the charm; indeed, it seems to leave the greater part. In connection with bridge approaches generally, I cannot resist showing a view of a little Japanese shrine erected in the water and reached by a characteristic wooden bridge.

Bridges, however, can only be made part of an architect's scheme by such fortunate accidents of situation as are rare. We want other suggestions. And we may find them, as abundantly as anywhere, in the works of the Italian Renaissance architects. They favoured small projecting porches as little as their predecessors, and were not very successful with them. That of the Miracoli Church at Brescia is the most favourable example I know, but it owes a good deal of its charm to the fact that its lines are of the simplest, and the delicate carving with which the lower part is covered is in such low relief that it is almost lost in the bright Italian sunlight. The porch of the hospital at Venice, a Renaissance version of the old semicircular hood on two legs, is florid and tasteless. By instinct and tradition the Italians seem to have preferred something that did not break the front of the building, and, if not content with a mere doorway, generally either recessed the porch within the front or built a portico that covered it. The little portico of the Pazzi chapel at Florence, which is chiefly celebrated in guide books for its barrel-vault of Della Robbia ware, illustrates these ideas, and also the delicate beauty of cinque-cento detail. The upper storey, with its imitation of wooden panelling, may be open to technical criticism both on that ground and because it looks too heavy for the columns. But one would gladly commit graver errors to produce so good a result. The arch rising in the middle above the entablature deserves a note. It reminds one of some of the late Roman porticoes in Syria and the narthex at Civita Vecchia, and may be borrowed direct or by tradition from late Classical work. One wonders whether it was possibly the germ from which the great arched recess in the portico of St. Andrea at Mantua grew, or whether Alberti borrowed the idea of the latter from the Mahommedan mosques, or possessed some tradition of such entrances as that to the palace at Ctesiphon. There seems to me to be great possibilities and suggestiveness in these great arches rising almost to the height of a building and deeply recessed into it. Broad, deeply-recessed porches are the rule in the Venetian palaces, where they are necessary to form a landing-stage, since the water comes up to the front wall of the building. But the similar porch in the garden front of the Villa Medici at Rome was a matter of choice. Here there is again the arch rising above the entablature over the middle opening, and further suggestiveness in the arrangement of the steps and balustrades which rise from either side to a landing bowed out in front to hold a small fountain.

The broad and deep "loggia" which forms the porch to some Italian villas is a feature common to all countries where shade from the sun is necessary, and modern "piazzas" and verandahs probably owe little or nothing to Italy, where it is commonly better designed than elsewhere. The one at Arezzo is a characteristic example, especially in the great projection of the eaves, the generally light and open treatment and the freedom of the architectural detail. There is sometimes an upper storey, still lighter and more open.

The Italians have never given up the enclosed courtyard plan (unless they have done so recently), partly no doubt because peace and security were so long strangers to the country, partly because the difference between their climate and ours, if not very great, is sufficient to make an enclosure, which on most days seems cold and gloomy here for more than half the year, in Italy a cool and shady retreat from glare and heat. As a consequence the entry to an Italian palace, or even a house of any pretension, is most frequently through a vaulted corridor to the courtyard in the first place. Plenty of such entrances, of course, are still to be seen in this country. We even built a very pretentious one to Somerset House not much more than a century ago. But here they more often repel the passer-by, by their suggestion of darkness and dirt, than invite him by their shade. In Italy the reverse is the case, and there are few more pleasing features of the great Italian palaces than the dark entrance which frames a picture of a brilliantly-lit courtyard. The entrance to the Farnese Palace at Rome, of which Mr. Potter has obtained such an excellent photograph, is a good instance of this. The view of the entrance to the Doge's Palace at Venice (which is also from one of Mr. Potter's photographs) is perhaps less striking in one way, owing to the light coming in from the side. But the view of the giant's staircase beyond more than balances the loss of the dark shadow. The giant's staircase is, as you know, the main entrance to the palace, and is strictly in accordance with Italian tradition. From a very early date what we should call the ground floor was, in Italian palaces and public buildings, a basement devoted to cellars and offices; and the state entrance to the building was by a grand flight of stairs, in rare instances direct from the street, more often from the courtyard. There are fourteenth-century examples of the former arrangement at Perugia and Lodi in the entrance to the town hall in each case. There is also a stairway entrance, probably of rather later date, direct from the street to the principal floor of a small house at Viterbo, which is a favourite subject for a sketch. That and the rather similar stair entrance from the courtyard in the Bargello at Florence are guarded by gates halfway up the stairs, a feature that suggests exciting moments in the history of the building. External stair entrances in the courtyards are common in the older palaces; but, though generally picturesque, are not often architecturally important or especially well planned. But in the later Renaissance palaces the stair approaches are generally laid out with great care and ingenuity and an obvious and successful intention to make the most of them. Mr. Lewis has lent me the two following illustrations, which are reproductions from

Digitized by Google

Piranesi's great work, and show what he thought might be made of stair approaches. The works actually executed naturally fall a good deal short of such ideals, but they are worth the most careful study. I believe the only examples we have in England of external staircases to upper-floor entrances—such as those at Wanstead House and Keddlestone Hall—were built in the eighteenth century in imitation of the Italian palaces. German castles and public buildings of the Renaissance period were, however, generally entered like the Italian ones, at the first-floor level. Unfortunately, the men who designed the means of access wanted the finesse of the Italians. The planning is crude and the architectural detail is coarse and sometimes grotesque. But the unrestrained freedom of ignorance combined with an abundance of native wit and wild fancy produced results which are frequently pleasing and suggestive of possibilities to the architect in search of ideas. The Rath-houses at Halberstadt, Lemgo, Lübeck, Heilbronn, Molsheim and Görlitz, and the castles at Transnitz and Hartenfels, all have external stair approaches that are worth studying. Such external staircases, I think, must be distinguished in our minds from the flights of steps which lead up to first-floor entrances in some few modern public buildings, such as University College. Such flights are probably borrowed direct from the Roman temples. And they must be distinguished, too, from the short flights and long terraces with their balustrades which form such an important feature of the approaches to the palaces and great houses of the later Renaissance in all European countries. The tendency of the latter is to breadth, of the others to concentration. The value of such terraces is recognised by everyone when they are used on a great scale, and no doubt it is due to the long horizontal lines of regular ornament broken at regular intervals by piers, perhaps with vases on them, and at longer but still regular intervals by the steps. But I do not think it is fully recognised how great an effect may be produced by a single flight of such steps and a little bit of balustrade when treated in a broad way. I have put on the wall a photograph of a very commonplace house, Draycott Manor, which seems to me to have been redeemed from ugliness by such simple means.

But a great public building, a great church, or even a great house calls for a more spacious approach with a more imposing architectural setting than a terrace and a balustrade. A courtyard of liberal dimensions and an architectectural screen are, in fact, essential in such a case. The screen should be high enough and close enough to give the sense, as well as the reality, of enclosure without either dwarfing the main building or shutting out light and air. The most satisfactory approach, on the whole, to any building in the world is the great square before St. Peter's at Rome, with its double screens sweeping round in two great semicircles at the sides. The only reproach it is possible to level at it is that it is too vast for the eye to take in as a whole. I rather suspect that Vanbrugh must have had those semicircular screens in his mind when he contrived the front of Blenheim with its two quadrants, and the plan of the courtyard at Seaton Delaval Hall, enclosed on three sides by screens which terminate in little pavilions and leave the front open, has also some suggestion in it of the same origin. The architecture of the Seaton Delaval screen is heavy, like all Vanbrugh's work, and not well suited to such a feature. The best screen enclosing a courtyard that we have in London is the one in front of the Admiralty in Whitehall. It was even better before it was altered. The plan of using the screen to close the fourth side of the courtyard, the other three sides of which are formed by the building, is typically English, derived of course from the late Elizabethan house plan.

I should like to have commented on a number of other branches of the subject and particular instances. I have neglected altogether the vast and prolific field of Mahommedan architecture, to say nothing of the native Indian, Russian and Chinese, from which some apt and curious illustrations might be drawn; and I have dealt very superficially even with French and German work. I meant to have noticed some approaches which are beautiful, as it seems, by accident, and others that are curious or eccentric. I should like to have called attention to some successful modern work, but the paper is already far too long, and all that must, for the present at least, be left unwritten.

Mr. W. Millard, in proposing a vote of thanks to the author of the paper, said he felt he had been taken through the whole history of architecture. The Mahommedan side had not been touched upon, but in half an hour they had gone through the history of a thousand years. They would all agree that the whole existence of arches and approaches, starting with the earlier examples, was based upon bare utility. A courtyard was not made unless it was needed and the architecture was considered after the requirements had been displayed. That which we called the architecture was the outcome of the fancy of man's mind after he had surmounted all the difficulties of his undertaking. There was one example of a porch mentioned in the paper, described as the Paradise. It was so called, the speaker thought, because the word paradise was a Mediæval term for a special enclosure. It was pleasant to meet with arches and approaches which belonged to our country, and review not only the church porches but the domestic examples also. We were getting rather in the way of thinking all our Mediæval work was church architecture. The speaker supposed there was just as much secular building done then as nowadays, and there was no real distinction between the two.

Mr. A. Needham Wilson, who seconded the vote of thanks, said he did not agree with the last speaker in attributing the erection of early approaches to merely utilitarian purposes. He believed they arose from the fact that the authorities and owners wished to lend dignity to their buildings, and there were instances of this in England. In Norfolk there was a striking church tower standing high above the land, and the road appeared to have been purposely diverted in order to give a vista of the church tower at the end of it. In conclusion the speaker said it became, perhaps, more difficult nowadays for architects who had to build 1,000*l.* houses to devote much attention to the approaches thereto, but if they could only convince their clients of the value of an approach that did not lead direct from a gateway new dignity would be added to their domestic work.

Mr. Francis Hooper said that Mr. Baggallay had not used the word mystery in his paper or referred to the element of mystery which a screened approach secured. The great charm an archway gave to the limited view beyond enabled the visitor to come suddenly upon a building or a view framed, as it were—this could be appreciated as one left the south-west gateway at Canterbury.

Mr. Gregory Collins supported the vote of thanks.

THE DIFFERENCE IN ARCHITECTURAL STYLES.*

It is not difficult to state one of the potent reasons why architecture may be of even greater interest to all men than are its sister arts, painting and sculpture. While among civilised and historical races all nations have at some time been sculptors and painters, and while some nations have at all times cultivated these arts, all civilised nations and races have at all times been architects and builders.

In the light of this fact, architecture is an illustrated book of the history of mankind, because it has always been closely in touch with all that is nearest to his physical, intellectual, moral, social and religious life; and we may find that there are more sermons in stones than even Shakespeare dreamed of, and that walls have not only ears to hear, but mighty tongues to speak and to tell the true stories of the lives of those who built them and lived within them. "Curiously sensitive to any essential phase in the progress of humanity, behind every form in architecture is a human motive. It is not merely an incident in the history of architecture, but an incident in the history of mankind."

Under all real architectural forms lies a principle of structure. The conditions of time and place may differ, varying with climate and available materials, with the characteristics of race and nationality and the habits and customs of communities. But the underlying principles of the art that make building architecture remain the same through the centuries, the same in the Valley of the Nile, on the Acropolis of Athens, on the seven hills of Rome (either in the days of the Empire or of the Popes), the same in the Mediæval cathedral, the same in the boulevards of Paris to-day. We must disabuse our minds at once of the false but not uncommon idea that architecture is merely a superficial adornment and decoration of a structure otherwise well built. This is not the fact. Good building and architecture in the broad sense of the terms, are identical. Architecture and the difference in so-called architectural

* A paper read by Mr. J. B. Noel Wyatt, architect, before the Municipal Art Society of Baltimore, and published in the *Architects and Builders' Journal* (Baltimore).

styles is a matter of construction and not of decoration; the one is the essence, the other only the incident—often only the mere accident—of the subject; and if we regard it from this point of view and separate the essentials from the non-essentials, it will readily be found that what at first may have seemed a subject involved in complications of styles and schools and epochs and technicalities is in reality simple and clear and a possible source of great intellectual and artistic interest and pleasure to the layman as well as to the artist.

Recognising, then, the truth that the essential factor which constitutes the difference in architectural styles is "not mere shape or colour, but structural significance," we can truthfully state that, in the broadest sense of the word, there are only two great styles, popularly referred to as the Classic and the Gothic, more correctly as the Greek and Roman and the Mediæval, but technically and accurately called the styles of the lintel and the arch, and that in sub-dividing these into nationalities and epochs we need name only five great dominating periods, which we call styles, that have become of important and permanent significance down to our own day—the Egyptian, Greek, Roman, Mediæval and Renaissance—each representing in a long chain of evolution a point where a certain final and distinct result has been obtained, satisfactory to existing conditions for the time being—a resting-place, as it were, in the ceaseless progression, but as much the result and offspring of what has gone before as it in itself became the progenitor of that which follows after. But in all this we find nowhere a sudden, sharp dividing line; the transitions in time were the slow work of centuries, the modifications in form often gradual; nowhere the construction had been abruptly and radically changed; traditions of previous forms were not hastily forgotten, and, moreover, there is always to be noticed effects of more or less temporary or external influences upon the dominating features of the style itself, such as the variations of climate and materials in neighbouring localities, or the contact, temporary or permanent, with other races differing in habits and religion, all resulting in an apparent mingling and overlapping, but this showing not so much in the essential principles of construction as in the less essential and superficial forms of decoration.

Why the lintel and the arch are the exponents of the two great styles is this. The two simple and essential factors of any building of any material, whether it be a palace or a hut, a temple or a tomb, are the upright wall supporting the super-imposed roof—and this upright feature may be either a solid wall, pierced with openings, or part of the wall may be reduced to columns, or further, the whole wall may become an open colonnade. It is the method adopted—either the lintel or the arch—to span the spaces and openings between solids that determines the style, and the statical conditions, so to speak, of the two styles are simply these. In order to meet and counteract the powers of nature, ever ready to overthrow and destroy a building, as gravity or earthquake or other natural phenomenon, the lintel and the beam offer but one resisting force, the non-breaking strength of the material used to span horizontally an open space between perpendicular uprights and bearing all the super-imposed weight above it. Gravity is drawing the mass to earth perpendicularly downward, and the strength of the lintel is resisting this force perpendicularly upward. There are no lateral or oblique forces at work anywhere, and that is the whole story, and the general structural result is evidently squarehead openings of limited width, while the impression, the effect produced upon the mind is that of simplicity, rest, repose; simplicity in this sense implying not mere plainness of result, but directness of purpose.

So much for the lintel. When, however, the Roman, in obedience to his needs and tastes, spread the principle of the arch over his openings and adopted it as his dominating system of construction, at once all the questions of weights and forces were changed and had to be met by new methods of resistance, involving new forms. There became practically no limit to width of spans and openings that might be spanned, if one could construct a temporary framework big enough to spring the masonry arch over and could build sufficient lateral buttresses to hold it up. But the arch at once becomes an active force in itself, "a force that never sleeps." The greater the weight upon it, the greater its active power in lateral and oblique thrust—ready ever for its own destruction. With its advent into the building world all scale and dimensions, as of former structures, were changed; the sense of calm repose was lost.

It is in the varied treatment of these two broad and general principles of structure—the lintel and the arch—that all modifications of architectural styles, ancient and modern, have their origin.

Our chronological starting-point, the first important link in the historical chain, is the Valley of the Nile, "the cradle of all modern architecture." No remains exist sufficiently important of historic races prior to this to enable us to follow back the thread of evidence very intelligently; but 5,000 years ago the Egyptians were already as far advanced in many lines of civilisation as we are to-day, and their pyramids and temples and tombs were there. We know they were a deeply religious people, and in their religion this sojourn here on earth was only a temporary incident, while the infinite length and repose of eternity and the transmigration of spirit was the pervading influence of their life. Their chief buildings were the temple and the tomb, and the character of these, in structure and form, was that of the greatest possible stability, permanence and massiveness; the amount of time and material consumed in their erection was a matter of no consideration, and was far in excess of what would be needed to obtain the same practical results to-day. Delicacy, refinement, elegance of form and detail, did not appeal to them; but what was lost in these was gained in the impressive grandeur, solidity and repose of the mass. It is needless to say that the motive of the arch, in its restless, sleepless action, did not appeal to them, although they were familiar with its form, as remains here and there reveal, but it never appeared in any position of importance. All construction was that of the excessively massive lintel, resting on the wall or column, and the columns themselves were huge cylinders of stone, with only the symbolic lotus blossom used as a mere suggestive form of decorative capital. The high, blank, almost fortress-like, exterior walls of the temples guarded the mysteries of the ceremonies within.

All interest centres upon the interior, where the great fore-court alone was open to the people, and beyond was the sacred and secret shrine of the god. It is of interest to follow up what these features of temple plan developed into, without radical change, in the temple of the Greek and Roman, of the early and Mediæval christian, and in our churches to-day. The unchanging monotony of this style is about all we know of the world's architecture from 3,000 B.C. till slowly through the centuries, as civilisation passed from Egypt into Europe, it came under the influence of the subtle mind and hand of Greece, where we find the next resting-place, the next epoch, the next style. Some ruins still extant that formed connecting links are noteworthy.

That is what the Greek found and this is what he did with it. As a people, unlike the Egyptians, the Greeks were an isolated colony of artists in the still half-barbaric Europe. "Keen of intellect and reason, they did not let their imagination lead them astray from the truth." The enjoyment of life and beauty in its fullest attainment was the end sought for, for its own sake, and there were few complications of life to dull this sense of enjoyment. In their art, as in all else, they sought to obtain the best that an intelligent application of theory and reasoning and ceaseless experiment could give, the highest point of intellectual beauty and refinement and satisfaction to the senses. This they accomplished (perhaps they builded better than they knew), so that by the verdict of all subsequent ages the nearest to perfection in art was that reached by the Greek in the third and fourth centuries B.C.

Unlike the Egyptian, the Greek studied his forms, from the mass to the most minute moulding, until he obtained for them such nearness to perfection in both proportion and detail that all subsequent ages have found that any important variation detracts rather than adds to their beauty.

Unlike the Roman who came after him, he made every feature of his building, his column, his wall, his lintel actually do the work they appear to do. There was no sham, no imitation, no concealment. His buildings had the pure beauty of the nude figure, while the Roman covered his forms with the most gorgeous decorations he could afford to dress them in. Greece, even when finally conquered and "killed as a nation, lived on as an artist," and in spite of Rome, "hung on to the borders of the nations," still living and breathing through the Romans and the Dark Ages, her spirit still felt through the Mediæval centuries, awakening in the Renaissance, and still the source of our highest artistic aspirations to-day.

The Roman was another creature. A great constructor, but not an artist; a conqueror, but not a subtle philosopher;

Digitized by Google

an administrator, but not a man of sentiment or imagination; a politician, the founder of civilisation, if you will, but art to him was never an end, only a means of expressing, if even only on the surface, his power and grandeur. It was a thing administered by the Imperial Government, not, as in Greece, part of the life of the people and subject to their verdict. "Rome placed her institutions above her genius, while Greece placed her genius first;" Rome conquered Greece and brought her artists in chains, but she was perfectly satisfied with the apparent rather than the real, and the forms of the genuine art of Greece were applied by the Roman merely as a surface decoration to a form of construction behind it, with which it formed no integral part, but only served to clothe, adorn and conceal the real forms which actually constituted the building.

So much for Rome—the third great architectural epoch.

With the fall of Rome came the almost architectural blank of the Dark Ages, and the "barbarian destroyer brought no art with him." But as the natural soil at times needs a fertiliser, so there are epochs when the times themselves seem to need a barbaric element, and that is what happened in the great Middle Ages. The Greek art spirit was not dead, and new life and blood of another kind was gradually being infused by the inroad of the northern hordes, the so-called "Goth," upon the soil of the new Christian religion. Civilisation was centring in France, Germany and England, in a northern climate of cold and snow and cloudy skies and granite rocks, as compared with bright suns and glowing marbles of the shores of the Mediterranean. The national characteristics were largely the result of the new religious faith and life, restless, superstitious, self-conscious, with learning and art chiefly confined to the cloister, a species of clerical aristocracy ruling over both rulers and people.

The buildings were first the great churches, abbeys, monasteries; a little later the great cathedrals, where decorative carvings (in stone), sometimes beautiful, often grotesque, were used as pictures to tell the Bible story, to expound the faith to the ignorant populace who knew no other books. Great was the skill of the men of that day as craftsmen and builders, and so great the spirit of true art still surviving that soon it burst the narrow bounds of the cloister and the church and spread among the people in the growing independent cities and States, in all their ambition and rivalry, producing the great town halls and other civic buildings, always still in the Gothic method of the arch and buttress. Rome and Greece were now far away in time and distance, almost forgotten or only remembered as the abode of anti-Christian heathens, and the influence of the ancient classic forms of order and proportion had been almost entirely lost. And then the tide began to turn. Liberty gradually became license; strength, weakness and decadence; and the great buildings of the Middle Ages grew to be often mere clever *tours de force* in ambitious rivalry of space and height and decoration. The flying buttress and the arch became bolder and bolder, weaker and weaker. Moreover, both the great feudal and religious spirits of the age were fast departing—the castle was yielding to the palace—while the mariner's compass, the New World, the Reformation and the printing press were turning men's minds into new channels. As has been said, "Knowledge killed the legend, the book killed the Church." The old things were dead, and the world was ready and waiting for the Renaissance.

I aimed to show in the previous part of this lecture that "style" in architecture was a matter of structure and not of ornament, and that in construction there are only two great principles differentiating the two broad styles of the lintel and the arch; that from the historic, geographic and chronologic point of view the changes are those of a long, slow and unbroken evolution or chain, with only five great epochs, which we term the Egyptian, the Greek, the Roman, the Mediæval and the Renaissance; and that of the chief underlying influence that created these styles, in their leading individual features and different characteristics, what religion was to the Egyptian, law was to the Roman and beauty to the Greek. With the Roman, law as the master, art the servant, and the spirit subservient to the letter, the result an art vast but machine made. With the Greek, art was the master, and such laws as we have been able to formulate from his work have necessarily been widely elastic in order to admit of that freedom of the spirit that lived and moved within it, when the hand becomes merely the cunning tool of the thinking brain, sensitive to every impression of perfect beauty.

And again, while the Mediæval buildings, in the period we call the Gothic, were largely influenced by the spirit of the religion of their age, as were the Egyptian, and show also the aim at truth and genuineness of construction, as did the Greek, they lacked entirely the characteristic of massive stability and permanence of the one, or the intellectual sense of repose and perfect beauty of the other, and were so devoid of that element of fixed law and order and proportion which distinguished the Roman that this freedom finally became license and ended in ruin, leaving the world both in mind and matter ready and eager for the Renaissance.

(*To be concluded.*)

GLOUCESTER CATHEDRAL.

THE following is a copy of a letter forwarded by Lord Ducie, the Lord Lieutenant of Gloucestershire, relating to the condition of Gloucester Cathedral:—

Gloucester: February 24, 1906.

Sir,—I have received from the Dean of Gloucester a disquieting report made to the Dean and Chapter by the resident architect of Gloucester Cathedral (Mr. Waller) concerning the fabric of the great building. The tower, one of the noblest in the world, the report says, is urgently in need of most careful reparative work. Not only are the more ornamental features rapidly disappearing, but the fabric of the tower is being seriously damaged owing to the perishing of the protecting mouldings of the stonework in many places. Wet has penetrated through the large joints, and is gradually loosening the stonework and even showing on the inside of the building. A recent fall of some of the stonework in connection with the groining of the choir roof in the immediate neighbourhood of the tower has been of a very alarming nature. In addition, the lead roofs of the nave and south aisle are in urgent need of reparation and renewal. They are all much worn, and the damp is penetrating and seriously injuring the constructive timbers of the roofs. These roofs must be largely replaced. Three of the pinnacles, two on the west front and the other on the south transept, were in danger of falling. One has been repaired and the other two must be taken in hand without delay. Other less important works are also urgently needed. If these various works are seriously taken in hand at once the architect of the cathedral is of opinion that the grave and threatening damage of the great fabric will be averted in time.

A general estimate of the cost of these essential works has been prepared and is enclosed herewith. With the view of raising the necessary funds to carry out these urgent works on our great cathedral, I have thought it well to call a public meeting in the chapter-house at Gloucester on Saturday, March 10, at 12.30 P.M. I trust it will be convenient for you to assist me by your presence at this meeting.—I have the honour to be, your obedient servant,

Ducie, H.M.'s Lieut. co. Gloucester.

The estimate of cost as prepared by Mr. Waller, the resident architect of Gloucester Cathedral, is as follows:—

Reparative work is most urgently needed on the following parts of the building and in the order given, the estimated cost being shown against each item:—

West pinnacles of the nave	£650 0 0
South-west turret of the south transept and clerestory windows of the nave, north side	250 0 0
Great central tower, including roof and first bay of the choir adjoining the tower	2,500 0 0
Roofs of the nave and south aisle	2,300 0 0
Roofs of the north transept, north aisle and south cloister	1,200 0 0
Exterior stonework of the south and north aisles and of the west end of the nave	1,250 0 0
	£8,150 0 0

As so many services and recitals are now held in the nave the lighting question has become very important. The present system by means of gas jets is causing injury to the stonework apart from the discolouring.

As the work will necessarily be spread over a period of at least three years, donations can, if so desired, be spread over that period. Among the amounts received are:—Earl of Ducie, 500*l.*; the Ecclesiastical Commissioners, 500*l.*; Earl Bathurst, 300*l.*; Mr. T. Dyer Edwards, 105*l.*; and 100*l.* each from the Dean of Gloucester, Lord Fitzhardinge, Sir John E. Dorrington, Bart., Mr. H. Dent-Brocklehurst, Mr. R. I. Tidswell, Mr. A. Strickland, Mr. R. V. Vassar-Smith, Mr. James Horlick, and the executors of the late Mr. Peter Stubs.

ARCHITECT WITH TWO MASTERS.

AN action of a very unusual kind was heard last week in Liverpool by Mr. Justice Grantham without a jury. The plaintiff, Mr. Thomas M. Shallcross, architect, had obtained judgment for 240*l.* against Mr. Moritz Bergl, and the latter counter-claimed 800*l.* damages for breach of duty in connection with the renovation of a restaurant of which he was proprietor.

The circumstances will be inferred from the judgment given in London by Mr. Justice Grantham on Tuesday, and which is reprinted from the *Liverpool Courier*. His Lordship said in that case Mr. Thomas M. Shallcross, an architect, of Liverpool, sued Mr. Moritz Bergl, the owner of the Carlton Public Hall and Restaurant, in Eberle Street, Liverpool, for fees as an architect in the carrying out of alterations to defendant's property. Defendant admitted his liability, but counter-claimed for neglect of duty and breach of duty as defendant's architect. The case was important in regard to the amount, but far more so from the principles involved, as plaintiff claimed to act in the interest of the builder unknown to the building owner at the same time that he was acting as architect for the building owner. In his judgment it was impossible to act honestly where the interests were antagonistic, and were it not that the plaintiff claimed the right to do as he had done, and said with great earnestness that such conduct was legitimate and was adopted by other architects he should have said that plaintiff had been guilty of great dishonesty. He had no reason to doubt his word, when he stated that he believed all through that he was justified in so acting—though he (his Lordship) could not believe that many other architects also acted in a similar capacity. He was bound to come to the conclusion that gross impropriety was committed by those architects who acted as the plaintiff had acted, and that his conceptions of what were professionally honest transactions were terribly marred and distorted by an inability on his part to understand the difference between right and wrong. It was only necessary to state the facts of the case to show the hopeless position in which the plaintiff had placed himself. Defendant was the owner of a large restaurant and public hall, and wished to improve it and so structurally alter it as to bring it up to modern requirements. He knew nothing of building himself, and he employed the plaintiff as his architect. The work might be considered as divided into two heads; first, the preparation of plans to lay before the magistrates and the consequent attendance on the magistrates for the purpose of getting their consent to the alterations; second, the preparation of plans for and the superintendence of the carrying out of the work. This work, though in one sense distinct, was in reality almost identical and overlapped, because he found that the plans prepared for the magistrates were practically the plans ultimately used for the carrying out of the work, and were mostly the plans charged for by the plaintiff in his charges for carrying out the alterations by the builder, and the whole of the negotiations for the contract and subsequently signed were being carried on while the proceedings before the magistrates were taking place. Defendant admitted that the plaintiff was his architect during the whole of that period, and that he was liable to pay him for his services as such. Now what was plaintiff's contention? It was that in the earlier part of the period he was entitled to act in the interest of Norman & Stacey, who were trying to get the contract; that he was entitled to get a contractor to do the work at a certain sum, and then to add 20 per cent. as a commission or bonus to the nominal amount of the builders, who also were a London firm of furniture dealers, who never intended to do a stroke of work themselves, and to represent to the defendant that sum as the fair and lowest price at which the work could be done. Plaintiff, in other words, contended that, knowing the work was to be done for 1,625*l.*, he was entitled to represent that sum at 1,950*l.* to the building owner. To do ample justice to the plaintiff, he would shortly state the justification that he put forward. He said he was brought into the matter by the nominal builders, and as employed by them to suggest a scheme for the alteration of defendant's premises, and in that way was introduced to him. Quite true. These nominal contractors were introduced to defendant by a person (Mr. Capper) who had, or said he had, an idea of taking the place when altered. But they now knew that he soon became bankrupt, that he expected to get a commission of 5 or 10 per cent. out of the nominal builders for the introduction, and they heard no more of Mr. Capper after the first interview. At the first interview with the defendant, a very short one, in London nothing was done, but at a second meeting, when plaintiff was present, the defendant agreed to employ plaintiff as his architect to prepare plans and manage the matter for him before the magistrates, and to get their consent to the proposed alteration, the defendant stating that if the magistrates passed the plans and the work could be done within his limit of price he should certainly carry it out. Plaintiff at once set himself to work to prepare the plans and attend the magistrates and the municipal authorities, &c., but the plaintiff said that he continued to act in the interest of Norman & Stacey, the nominal builders, and was justified in getting the most favourable terms he could for them and the highest price he could out of the defendant for the work, though at the same time employed to superintend the work for the defendant. In other words, for nine months, according to his suggestion, he was justified in acting for two masters whose interests were opposed to each other, and for the last six months when acting only for defendant he was justified in withholding from the defendant all the knowledge that he possessed as to the best way of carrying out the work in the interest of the defendant, because by so doing he would be betraying the interest of the other employer, who had previously, as it were, been a joint employer of him with the defendant. An impossible position. Never was the truth of the great adage better exemplified, "You cannot serve two masters, for if you do you will hate the one and love the other, or love the one and despise the other," than it had been in that case. There could be no doubt that from start to finish the plaintiff looked to the interest of Norman & Stacey, and never once that he could see, when there was any conflicting interest, looked to the interest of the defendant, though the special work alleged to be done by the plaintiff for Norman & Stacey was only of the alleged value of 31*l.*, as against 300*l.* charged to defendant. His Lordship found, as a fact, that plaintiff was accepted as defendant's architect, and that he neglected defendant's interests and committed a gross breach of duty in acting at the same time for the nominal builders. He would find, if necessary, that he was guilty of negligence in the way the contract was prepared and the orders for extra work given; but he found in reality that it was not by ordinary negligence that the work was so done, but because it was to the interest of the builders to so do it. Not only was the defendant prejudiced by having to pay 1,950*l.* as the contract sum for the work instead of 1,625*l.*, but also extras to the amount of about 2,500*l.* It would be said that even if the defendant had known Norman & Stacey were getting the work done by a sub-contractor for 1,625*l.* instead of 1,950*l.*, *non constat* that the defendant could not have done it for that sum. His Lordship believed he could have done so, because plaintiff's own account of it was that his instructions to the sub-contractor, Marshall, were to put his tender at such a price as would enable Norman & Stacey to obtain the contract against London contractors when they had added 20 per cent. to his price. But why limit it to London contractors? The property was in Liverpool, the architect was there, and the defendant had his agents there who superintended the property. Marshall was not estimating as against any local contractor, but was taking advantage of the known higher prices of London firms. He thought the defendant might have successfully claimed the return of almost the whole 20 per cent., but as defendant's advisers had generously said they would accept a basis of 10 per cent., he found that the defendant was damaged by plaintiff's conduct to the extent of 400*l.* As to the amount of 2,500*l.* for extra charges, though many of these were unjust and foolish requirements on the part of the Liverpool municipal surveyor, there was no doubt a great deal of work to be done that was not anticipated, and in that case he thought it would not be right to make the plaintiff refund money paid to the builders, and he did not give any damages on that head to the defendant. His judgment was, therefore, for the defendant on the counter-claim for 400*l.* with costs, including the costs of the interrogatories and amendments, and any other costs left in his discretion.

A stay of execution, applied for by Mr. Tobin, K.C., was refused.

The Drawings in connection with the Hackney Public Library competition will be exhibited from the 12th to the 17th inst. at the Hackney Baths, N.E.

THE SOCIETY OF SCOTTISH ARTISTS.

THE twelfth report of the Council of the Society of Scottish Artists states that the Society consists at present of 138 professional, 49 lay, 47 honorary lay and 13 life members. The Council regret to have to record that the Society has recently lost by death from the roll of its professional members Miss Christina P. Ross, R.S.W. The Honourable the Board of Manufactures having granted to the Society the use of the R.S.A. National Galleries for the months of July, August, September and October 1905, the Council were enabled to hold an exhibition there during that period, which was well patronised. The exhibition, which was opened in July and closed in October, was artistically of the same high standard as in former years, with a gratifying increase in the attendance. The sales of pictures amounted to 402*l.* 9*s.* The financial position was satisfactory, there being the sum of 1,019*l.* 9*s.* 2*d.* at the credit of the Society, showing a surplus on the year's work of 223*l.* 5*s.* The Council desire to express the thanks of the Society to the Honourable the Board of Manufactures for granting the use of the galleries for the past season, and also to those gentlemen who kindly lent their valuable pictures to the exhibition. The Honourable the Board of Manufactures having again granted the use of the Royal Scottish Academy National Galleries to the Society for this year, the Council trust that the members will do their utmost to make the 1906 exhibition a very successful one. The following members of Council retire :—Messrs. Marshall Brown and J. Hamilton Mackenzie, professional; and James Steuart, W.S., lay, and the vacancies thus created must now be filled up.

Correspondence

Assumption of the Letters "F.S.A."

SIR,—May I point out in reply to Mr. Watling, whose letter I have only just seen, that by long usage and universal custom and courtesy, the letters "F.S.A." are restricted in England to Fellows of the Society of Antiquaries of London, from whom Fellows of the Society of Antiquaries of Scotland are distinguished by appending to their names "F.S.A.Scot."

March 2, 1906. W. H. ST. JOHN HOPE.

GENERAL.

A Special General Meeting of the Royal Institute of British Architects was held on Monday last, when it was resolved, *nem. con.*, that subject to His Majesty's gracious sanction the Royal Gold Medal for the promotion of architecture be awarded this year to Sir Lawrence Alma-Tadema, R.A., Hon. Fellow.

The Governors of the National Gallery, Dublin, have received the first consignment of the art collection assigned to them by the Countess of Milltown some five years ago. The delay in delivery has been due to an objection taken by her ladyship to the nature of the accommodation provided, on the ground that it was inadequate. The trustees applied to the Master of the Rolls in Dublin for specific performance of the deed of gift, and obtained an order entitling them to possession of the collection on March 1. The collection consists of 223 pictures, 48 pieces of sculpture, 32 engravings, 50 miscellaneous art objects, 528 pieces of silver, and an extensive library, and is estimated to be worth 50,000*l.*

The Artists' General Benevolent Institution reported at their annual meeting that the gross receipts during 1905 were 8,306*l.*, of which 2,550*l.* was invested, being legacies, leaving 5,756*l.* for the general purposes of the Institution. The sum of 3,590*l.* was subscribed at the last dinner. The annual dinner would be held on May 12 next. The amount of 3,900*l.* was distributed during the year among 188 applicants in sums varying from 10*l.* to 100*l.* Sir E. Poynter, P.R.A., was re-elected president for the ensuing year. Sir Aston Webb, R.A., was appointed hon. treasurer, and Mr. A. S. Cope, A.R.A., hon. secretary. Mr. W. W. Ouless, R.A., was elected a vice-president.

The Committee of the city of Nottingham Museum and Art Gallery have just published a complete illustrated catalogue of the valuable permanent collection of paintings, drawings and sculpture which has been formed during the past twenty-seven years.

Lectures on the "History and Architecture of the Church of St. Bartholomew-the-Great, West Smithfield," will be given on the afternoons of the 17th and 31st inst., and the cloister as well as other portions of the building will be open for inspection.

Mr. A. G. Cross, F.S.I., has been elected honorary secretary of the Quantity Surveyors' Association in place of Mr. F. B. Hollis, who has resigned the position. The address of the Association still remains 17 Bedford Row, W.C.

Mr. F. J. Horniman, who presented to the London County Council in 1901 the Horniman Museum, Forest Hill, died on Monday. He spent 40,000*l.* on this museum for the accommodation of his collections and library.

Professor Hubert von Herkomer, C.V.O., R.A., has undertaken to deliver four lectures in connection with the Hermione lectureship at the Alexandra College, Dublin, in November next.

The Roman Antiquities Committee of Yorkshire, formed to promote the study of Roman antiquities in the county, and in some degree to co-ordinate scientific archæological research with the work of the local Universities of Leeds and Sheffield, held their first annual meeting at York on Saturday. The following work for the ensuing summer was decided upon :—The investigation of the Roman road from Ilkley to Adel and Tadcaster, the excavation of the Roman villa at Harpham, the investigation of the Roman road between Stamford Bridge and Filey, the excavation of Roman foundations at Middleham, the investigation of Roman remains at Well, near Tanfield. A joint excursion with the Manchester Antiquarian Society was proposed for the investigation of the Roman road over Blackstone Edge.

An Exhibition of pictures and studies of some architectural monuments of London, ancient and modern, including St. Paul's and Westminster Abbey, by Mr. John Fulleylove, R.I., will be open next week at the gallery of the Fine Art Society at 148 New Bond Street.

An Exhibition of a selection from the work of the late C. W. Furse, A.R.A., will be opened on Tuesday next at the Burlington Fine Arts Club, and will close on April 8.

A Paper will be read by Mr. W. Henry White, architect, this evening on "Town Houses, Old and New," at Hamilton House, Victoria Embankment, before the Auctioneers' Institute. Between March 12 and 17 the Institute will remove to 34 Russell Square.

A Guide Book is in course of preparation in connection with the forthcoming visit of the British Association to York. The following articles will be included :—"Prehistoric Archæology," Dr. G. A. Auden; "Mediæval and Modern York," Mr. W. W. Hargrove; "The Minster and the Churches," Mr. George Benson; "Monastic Buildings," Rev. J. Solloway; "The Minster Library," Rev. Canon Watson; "Historical Manuscripts Preserved in York," Mr. John Brown; "City Insignia and Plate," the Dean of York.

The Streets and Buildings Committee of the Scarborough Corporation have agreed to pay Mr. E. T. Beard the sum of 700*l.* in full discharge of his claims for professional services in connection with the new Scarborough Marine Drive and Promenade, for which he was the resident engineer.

Under the Will of the late Mr. James Scarlett, Manchester University has received a bequest of 1,500*l.* for the foundation of a scholarship in engineering, to be called the James Scarlett Engineering Scholarship. The scholarship is to be open to candidates who reside in or near Manchester and are members of the industrial classes.

The Winsley Sanatorium has aroused the admiration of Sir William F. Broadbent. In the course of a letter written to the chairman subsequent to a visit he says :—"You have solved the problem of efficiency with economy in construction and maintenance, and you had previously set the entire country an example as to the concurrent erection and endowment of such an institution. The situation is excellent from every point of view and very beautiful. The architecture of the buildings strikes one as pleasing, and the combination of the two blocks, with the shelters one above the other, is very pretty and picturesque. The patients' rooms are all that could be desired in the way of cheerfulness, comfort and free access of air, and I do not know that there is a single improvement I could suggest—I learnt, indeed, a great deal which will be useful to me. What most astonished me was the small space occupied by the kitchen and its annexes and by the laundry, but the arrangements are evidently good, and experience has shown that the provision for all demands is adequate."

The Architect.

THE WEEK.

THE painting known as the Rokeby *Venus* is now in the National Gallery, and for some weeks it is likely to receive more attention than any other work in the collection. It suggests the indifference with which VELASQUEZ and his works were regarded when we find Sir WALTER SCOTT, although a frequent visitor to Mr. MORRITT, makes no mention of the artist or his picture. In those days it may have been considered as indecorous, and was therefore kept in seclusion. The history of the painting is obscure. Professor BALDWIN BROWN, when lecturing last week at Edinburgh, referred to a recent paper by Señor DE BERUETE, which alludes to an inventory drawn up in 1682, in which the *Venus with the Mirror* is mentioned as one of the possessions of two Spanish nobles, father and son, who both filled the office of Viceroy of Naples, Don LUIS MÉNDEZ DE HARO and Don GASPAR. The granddaughter and daughter of these nobles married in 1688 the Duke of ALBA, and brought with her the rich collections of art which they had formed. The picture accordingly figures in a notice prepared of the ALBA treasures in 1776. The question remains, How did it come into the possession of the family whose daughter brought it by marriage into the ALBA Palace? Now, the DE HARO family were the heirs of the famous Duke D'OLIVAREZ, Minister of PHILIP IV., so well known from his equestrian portrait by VELASQUEZ, and this Don LUIS MÉNDEZ DE HARO, a great lover of art, was in high favour in his time with the king. Hence Señor DE BERUETE suggests that the picture may have been originally presented to LUIS DE HARO either by the painter himself, who had been a *protégé* of OLIVAREZ, or else by the king. By this theory the picture never formed a part of the royal collection, although in the Prado Gallery at Madrid there appears to have been a *Psyche and Cupid*, which some suppose to be the Rokeby picture.

THE London County Buildings Bill was read a second time on Tuesday. The Bill, which is promoted by the County Council, seeks powers to borrow 655,000*l.*, out of which 600,000*l.* is to be paid for the purchase of five acres of land near Westminster Bridge, on the Surrey side, as a site for the county hall and buildings, the remainder of the money being spent on the construction of an embankment. Practically there has been no opposition to the Bill. The debt of the Metropolis is 33,000,000*l.*, or nearly double the amount it was in 1889. But the increased outlay necessarily means an increase of the staff, which now numbers about 2,000. When the late Mr. MARRABLE designed the offices in Spring Gardens it was not contemplated that such a number would have to be provided for. At present nearly 38,765*l.* is paid for rent for outlying offices. At another time 1,056,000*l.* will have to be raised to construct the buildings, which will have a length of about 800 feet. The site at present does not appear advantageous, and there are associations with Middlesex which will have to be broken; but no more suitable site was obtainable without a lavish expenditure. The lack of opposition hitherto suggests that there are not many ways of overcoming the difficulty. As parts of the ceiling of the present county hall have fallen in, it is evident that a change is desirable.

THE general purposes committee of the London County Council have recommended amendments in the conditions as to letting property on lease which might be adopted with advantage by many other owners of property in the Metropolis. Clauses are to be inserted in the case of isolated and outlying plots of land, granting an option to be exercised within five years, to purchase the reversion at a price representing not less than twenty-five years' purchase, to be fixed by the improvements committee in consultation with the finance committee, provided that the lessee be allowed to exercise such option only in cases where the buildings to be erected have been completed to the satisfaction of the architect in accordance with the contract for letting. The terms of leases are to be for periods of not less than eighty years or of more than ninety-nine years, the exact period being fixed in each case by the improvements committee, in consultation with the finance committee, before the publication of the conditions of sale. The improvements committee, in consultation with the housing of the working classes committee, are to be authorised to amend the conditions as to the sale of sites for the erection of buildings to accommodate persons of the labouring class, so as to provide that the buildings shall be constructed of good and suitable material and workmanship to the satisfaction of the architect.

COLWYN BAY is becoming increasingly attractive, and as a watering-place is a rival to Llandudno. Obligations are accordingly imposed on the local authorities to insure a high standard of sanitation. The local District Board have undertaken the construction of sewers, a pumping station and other works for discharging sewage into the sea. One of the landowners through whose property the sewers had to pass claimed 11,000*l.* as compensation. The case was referred by the Courts to arbitration. The works in question were authorised by a local Act which was passed in 1902, and they also came under the provisions of the Public Health Act, 1875. At the hearing it was contended that it was not competent for the arbitrators and the umpire to take evidence as to damage alleged to be caused by the exercise of powers other than the powers of the Public Health Act. That would narrow the scope of the inquiry, and application was made to the Higher Courts for advice on the point. The case was heard before the Lord Chief Justice, Mr. Justice RIDLEY and Mr. Justice DARLING as a Divisional Court. The Lord Chief Justice said that a question of considerable importance was raised, and the Court were unanimous in the opinion that the evidence ought to be admitted by the arbitrator, who then, if the facts warranted, should make his award in the form of a special case which would raise the questions of law involved. From this it will be evident that there is some indefiniteness at present about the limits of such an inquiry. As Colwyn Bay is not peculiar in carrying out operations under private Acts as well as the Public Health Act, it is to be hoped that no time will be lost before a decision on the subject is given.

IT is not unlikely that before many years there will be a competition for assessorships like that for architects' commissions. The Caversham new buildings committee have been divided about the choice of an assessor in the competition for a public library which is about to be erected. The sum proposed to be expended was to be not more than 15 guineas. In the report submitted to the Council the majority stated:—"They are, however, unable to suggest any method by which a competent assessor can be engaged at such a fee, and they therefore beg to resubmit their former recommendation, viz. that the Royal Institute of British Architects be asked to nominate an assessor to assist the committee in the framing of the conditions of competition and to adjudicate upon the designs submitted at a fee of 30 guineas, plus one-fifth per cent. upon the estimated cost of the buildings." The member who proposed the adoption of the report said he was opposed to paying so large a fee. The chairman had also had a conversation with Messrs. C. SMITH & SON, of Reading, and they were willing to undertake the judging of the designs for 15 guineas. That offer was accepted unanimously by the Council. If the state of the case were known there can be little doubt that offers would be received for the assessorship at a much lower amount.

JAMES BARRY, R.A.

THE last number of the *Journal of the Society of Arts* reminds Englishmen that on March 7, 1806, the body of JAMES BARRY, the painter, lay in state in the meeting-room of the Society. His name will long be associated with the walls of that room in the Adelphi which he adorned, and, moreover, as we are told, "BARRY, who quarrelled with most of his friends, always held the Society in high esteem, and the Society did not forget the artist who had devoted himself to its service." At the present time it is in the great room of the Society that we can realise the qualities of BARRY'S work. He was born in 1741, and it was in 1777 that he undertook to represent by a series of pictures the proposition that "the happiness of mankind is promoted in proportion to the cultivation of knowledge" at his own expense. A few years before he offered to join with other artists in decorating St. Paul's, and he selected as his subject "The Jews rejecting CHRIST." Failing in one place he resolved to try his fortune elsewhere in order to demonstrate to his countrymen the full extent of his powers. In the mind of BARRY there were some notions about progress or development, only, as he was a sincere Christian, he believed that the final stages were not to be reached in this world. "We begin," he said, "with man in a savage state, full of inconvenience, imperfection and misery, and we follow him through several gradations of culture and happiness, which, after our probationary state here, are finally attended with beatitude or misery." It would be impossible in six paintings to suggest the history of civilisation, and the spectator must fill up the gaps by his own imagination. Prehistoric man, as he lived in the Stone Age or earlier, was unknown to BARRY, or, if he imagined some such state, he ignored it. He began with Greece and ORPHEUS. Then came a Grecian harvest home, and, lastly, the triumph of athletes at Olympia. England then takes the place of Greece with a view of the Triumph of the Thames. A further stage is shown in the distribution of prizes by the Society of Arts, and finally we have Elysium, for which not even BARRY'S soaring imagination was able to give a revelation which could be convincing of happiness.

The paintings may now seem to us as not adapted for imitation, or, in other words, they are not founded on decorative principles. But if we consider the pictures on the walls of the Paris *mairies*, which are the most complete series in Europe, we shall find that there is as great a variety of subjects as BARRY attempted to deal with, and that the allegorical is also often mingled with the actual. We should remember that in the eighteenth century wall-painting in England was practically an unknown art. The Bishop of LONDON would not allow pictures by the foremost artists of the time to appear on the walls of his cathedral, and his action was approved by the king and by posterity. The Society of Arts was therefore in advance of the time when, in 1774, they proposed to decorate the great room with historical and allegorical pictures, the subjects of the former to be taken from English history, and the latter to be emblematic of the views of the Society. Applications through VAL GREEN, the engraver, were made to REYNOLDS, WEST, CIPRIANI, DANCE, ROMNEY, PENNY, MORTIMER, WRIGHT, ANGELICA KAUFFMANN and BARRY. Each was invited to paint one picture, and the remuneration was to be a share of the profits arising from an exhibition of the works. The proposal was not accepted. Three years afterwards BARRY made his offer through the same agent, and it was accepted, although it was not known to the committee who was the artist.

The paintings appear to have occupied BARRY for about six years. They were exhibited in 1783 and 1784, and a sum of 503*l.* 12*s.* was received from the 9,952 visitors. JONAS HANWAY was probably not the only visitor who paid a guinea instead of a shilling for admission. When he entered on the work BARRY, it is stated, possessed only sixteen shillings. In a short time he must have become alarmed about his means of living while engaged on the big pictures. All that the Society was to supply were paints and canvas. He was therefore compelled to ask that some of the members would subscribe 100*l.* a year for a couple of years, which he promised to repay out of the proceeds of the exhibition. BARRY was frank about the possibilities of failure. "If the exhibition produces nothing," he wrote, "or the Society should neglect to make one, you will then lose your money; but a public work will be completed, and I shall be happy, as the opportunity of throwing myself out on such a work will be to me a reward fully sufficient."

BARRY was not indifferent to the ordinary means of obtaining a livelihood while engaged on the wall-paintings. In 1774 he exhibited at the Royal Academy *King Lear and Cordelia*, *Antiochus and Stratonice*, *Mercury inventing the Lyre*, and a portrait of EDMUND BURKE. In 1775 his contributions to the Academy were *The Death of Adonis* and a drawing of PANDORA. In 1776 he sent the *Death of General Wolfe* and *Ulysses and his Companions*. That was the last year he contributed to the Academy. It is to be feared his easel works were not appreciated. BARRY, however, was paid 100 guineas for a copy of one of the portraits in the Society's pictures, another admirer bequeathed 100*l.* to him, and a third gave him 50*l.* His vigorous etchings from the wall-paintings yielded a profit of about 200*l.* He was able to purchase an annuity of 60*l.* a year, and at a later time, after he was dismissed from the Academy, 1,000*l.* was subscribed by friends, for which the first Sir ROBERT PEEL agreed to give him an annuity of 120*l.* yearly. It could not, therefore, be said that BARRY was at any time after he displayed his ability in danger of starvation. Besides, his wants were few. He was familiar with asceticism, and in one of his letters he said he would be content with bread and soup and a coat to cover him if he were able to paint amidst his books and casts and have the use of models whenever he required them. But he knew that he was impracticable in many ways, and before coming to London he wrote:—"I reflect with horror upon such a fellow as I am, and with such a kind of art in London, with house-rent to pay, duns to follow me, and employers to look for."

In London his philosophy was subjected to tests which he did not anticipate. There was no painter in England at the time whose education was so complete. The five years which he spent in Italy were devoted to a passionate study of art, with the result that his love of the antique grew stronger every day. Indeed, it is possible that his disputes, of which so much was afterwards made, arose out of dissatisfaction with men who called themselves artists, but who gave no signs of earnestness or enthusiasm. He also saw that amateurs through their ignorance were defrauded, and that pseudo-relics of antiquity attracted the patronage which should have been given to the works of living artists. It was in defence of art that BARRY tormented others as well as himself. He also was in arms against theories which prevailed not only among foreigners, but amongst his countrymen, about Englishmen being incapable of producing art of the highest class. But when he came to England he found that affairs were even less favourable than he had imagined, and he thought he was showing a practical spirit when he proposed to charge for a painting by the number of figures in it.

It cannot be said that the Royal Academy was unfavourable to him. He came to London in 1770, he exhibited an *Adam and Eve* in 1771 and a *Venus Rising from the Sea* in 1772. The latter work gained him an associateship, and in 1773 he was elected an Academician. According to JOHN FORSTER, BARRY'S dislike of the President was manifested from the time he returned to England, and was a subject of discussion between him and GOLDSMITH. It was only natural that BARRY should be in opposition to many of

Digitized by Google

REYNOLDS's theories. The President was in favour of Renaissance art, and approved of the compromise of incongruous qualities which was known as eclecticism. BARRY was in favour of the great Italians, but he believed that for form the ancients were the only masters. His enthusiasm for Greek art was unbounded. "What," he asks in one of his lectures, "were the few touches about the brows and hair of HOMER'S JOVE when compared with that wonder of the world, the statue of PHIDIAS at Olympia? What ideas must have been entertained of this statue when the inquiry was whether JOVE came down to show himself to PHIDIAS, or whether PHIDIAS had been carried up to see JOVE?" It was easy for a man of BARRY'S idiosyncrasy to imagine that as REYNOLDS could only paint portraits he was not disposed to encourage art in any other form. BARRY held that a great many of the obstacles thrown in the way of superior art—*i.e.* the art which he was resolved to follow—were owing to the secret workings and machinations of interested artists who played the part of the dog in the manger. When BARRY was appointed professor of painting it was easy for him to believe that the contracted and beggarly state of the Academical Library was part of a plan to hamper him as well as to divert English art students from the right way. BARRY was a reformer, but he was deprived of the power of putting things properly. He was not an easy man to live with or to work with. He was not systematic in his operations, and there is some excuse for the Academicians if they rebelled against an unsuccessful man who took care to make them feel he was their superior, and whose lectures contained many heresies. If REYNOLDS had lived it is not unlikely that he would have prevented the proceedings which ended in BARRY'S expulsion from the Academy. But he had been lying in St. Paul's for seven years, and it was not until 1806 that BARRY'S remains found a place near him in the crypt.

JAMES BARRY was one of a line of artists who have been carried away by a belief in their own power of creating forms which are superior to those of ordinary men and women, and who toil in representing incidents which are supposed to be more exalted than those of ordinary life. Such votaries of the ideal generally have to endure a life of martyrdom. But we must respect their motives. Some of them may take pecuniary difficulties as lightly as MICAWBER or SKIMPOLE. But BARRY was not a man of that kind. He was rather proud of being sacrificed for art. If at the end of the eighteenth century the decoration of another public building in London had been offered to him on similar conditions to those of the Society of Arts, we are confident that he would have undertaken the work with alacrity. He was perhaps more eager to paint the progress of theology than the progress of the arts. Yet there was no institution at that time where he could be allowed the opportunity. In no country was there ever a stronger enthusiast or one who had more of the spirit of self-denial in everything except speech. But he was not adapted for life in a country where business principles are expected to be adopted by all men. BARRY would perhaps have painted better if somebody took care of his domestic arrangements, for it is not good for artists as for other men to live alone. But he was too honest to make others suffer through his devotion to art.

By Joint Arrangement between the Crown authorities in Scotland and the Linlithgow Town Council, important improvements are being carried out in the grounds of that old historical landmark, Linlithgow Palace. These include the construction of lavatory accommodation, a provision the absence of which, in view of the increasing popularity of the town and district as a summer holiday resort, had been frequently commented upon. In recent years much has also been done to the ancient palace itself by way of repairing and preserving those parts most affected by the stress of wind and weather.

GLOUCESTER CATHEDRAL.

WE published last week the appeal of the Lord Lieutenant of the county of Gloucester for funds to carry out indispensable works in the tower and other parts of Gloucester Cathedral. From the statement which was made by Mr. WALLER, the architect, at a meeting on Saturday it is supposed that the injury was caused by some earth movements to which the western parts of England were recently subjected. Whatever the cause, there is urgent need of reparation to the glorious central tower. The risks can be judged from the following statement:—"Not only are the more ornamental features rapidly disappearing, but the fabric of the tower is being seriously damaged owing to the perishing of the protecting mouldings of the stonework in many places. Wet has penetrated through the large joints, and is gradually loosening the stonework, and even showing on the inside of the building. A recent fall of some of the stonework in connection with the groining of the choir roof in the immediate neighbourhood of the tower has been of a very alarming nature."

Gloucester Cathedral can claim public attention and public support for two important reasons. It has historical interest and it has architectural interest. If we possessed an organisation like the Historic Monuments Commission of France the cathedral would be one of the first buildings which would come under its control. The city was at one time almost a capital. EDWARD THE CONFESSOR repeatedly went there; it had attractions for the early Norman kings, and HENRY III. loved Gloucester better than London. He was crowned in the abbey church. The siege of Gloucester by CHARLES I. was one of the great events of the Civil War. But in the Middle Ages the incident which gave to the cathedral a national importance was the bringing the body of EDWARD II. to the abbey by the Abbot THOKEY from Berkeley Castle and the burial of the corpse in the choir near the great altar. This was a courageous act, for the monasteries of Bristol, Kingswood and Malmesbury had through fear refused to receive the remains. By EDWARD III. special privileges were granted to the abbey in return for the reverence shown to the late king, his father. The monks were rewarded in another way, for a large revenue was derived from the offerings of pilgrims who wished to pray at the tomb of the murdered king, and the money appears to have been wisely expended on building.

The architectural interest is remarkable. According to tradition there was an abbey founded in Gloucester in the seventh century. It is believed that the foundations of the cathedral were laid in the eleventh century. A remarkable drawing was made some years ago by Mr. F. S. WALLER showing the extent of the Norman work of the eleventh and twelfth centuries which still remains in the building, and which is almost enough to suggest that its strength depends in a great measure on the Norman substructure. But it is in respect of later Gothic that Gloucester becomes an influential factor. The debt to it has been described admirably by Mr. FRANCIS BOND in his encyclopædic volume on "Gothic Architecture in England":—

The supreme importance of Gloucester in the history of the later Gothic has never been adequately recognised. She turned the current of English architecture in a wholly new direction. But for Gloucester English Decorated work might well have developed into a Flamboyant as rich and fanciful as that of France. But to the remotest corners of the land, to cathedral, abbey church, collegiate and parish church, there was brought the influence of Gloucester by the countless pilgrims to the shrine of Edward II. in her choir. In the first place, she set the greater churches the fashion which had long prevailed in the parish churches of remodelling rather than rebuilding. At Gloucester Norman choir and transept were not pulled down to the ground to be rebuilt, but only the clerestory. A similar treatment, more or less conservative, was adopted in Malmesbury nave, Tewkesbury

Digitized by Google

choir, Winchester nave, Malvern, Norwich choir, Sherborne, Oxford Cathedral. Throughout England the new stained glass of Gloucester was adopted; throughout England big aisle and end windows were inserted, and tall clerestories were erected to hold it. Everywhere the tracery of the windows became, as at Gloucester, rectilinear; and the whole church was brought into harmony by spreading rectilinear panelling over wall, buttress, battlement, tower, even over the fan vaulting. Gloucester taught Sherborne how to dispense with flying buttresses in her vaulted nave. Gloucester exhibited the utmost exuberance of lierne vaulting. Gloucester transept brought every rib of the vaulting into the organism of the pier. Gloucester choir converted clerestory wall into clerestory piers; and on this skeleton construction poised her lierne vaults midway amid the painted glass—an audacity of construction which to the very end of English Gothic remained unrivalled. All these great things were wrought in Gloucester by the middle of the fourteenth century.

Gloucester is exceptional in possessing documents which might be supposed to serve for a complete history of the buildings. The Abbot FROUCESTER, who was appointed in 1381, began to compile a chronicle which he continued until 1412. But, like the majority of ecclesiastics, he does not give information concerning the manner in which the buildings were planned or designed. In the eighteenth century FROUCESTER'S materials were treated by Archdeacon FURNEY for a new history. In fact, Gloucester Cathedral has been a favourite subject with historians and archæologists.

The Norman kings, as we have said, were for some unknown reason attracted to Gloucester. They had a palace or *Aula Regis* in the north of the city. The monks of the abbey of St. Peter were able to obtain many valuable privileges from them. According to one of the records "they had *sac*, *soc* and *theam* and *infangenetheof*; they were quit of *carriage*, *summage* and *conduct*, *king's tallage*, and all royal works and unjust exactions; whatever they bought, sold or consumed was exempt from toll, custom, passage or pontage; wherever they went they might pass unmolested, under pain of forfeiture to the king from any offender in *wick* and *vill*, in wood and in plain, on land and water, on sea and in port." They had also free warren in their Gloucestershire estates and beyond the Severn. Wherever their authority prevailed no one was to pursue any game or take fish from the waters without their permission. Even the king's foresters, huntsmen and archers on the Welsh side of the river and in the Forest of Dean were to surrender a tithe of any venison obtained in the forests. After the death of HENRY III. the abbey suffered, and in 1323 a petition was presented in which it was stated:—"That the church of the monastery, built by pious founders of olden time for Divine worship in a sumptuous style, had long ago for the most part fallen down through mere antiquity and decay and the remainder threatened soon to fall; that they had laid out large sums in the repair thereof, and that more must be expended in work newly begun; that the monastery, situated in a public place and famous town, was subject to a very great burden of hospitality from the reception of persons resorting thither in very great numbers from divers parts of the world." Four years afterwards EDWARD II. was murdered and the monks expended far more than they could afford on the royal funeral. The pilgrimages which followed brought to the Treasury large sums which enabled the monks to undertake the work which had long been desired in the abbey. Abbot THOKEY was said to have erected the south aisle of the nave in 1318, but he resigned in 1329 and left to his successor JOHN WYGEMORE the carrying out of the alterations which were desired. He held office for only eight years, but some writers give him credit for more work than could have been performed in that time. As it is recorded of him that he presented vestments embroidered by his own hand in gold with figures of birds, we may assume that he was an artist, and as he was described as being skilled in mechanics, we suppose that means experience in construction. Works were carried on under his successors, ADAM DE STORNTON and THOMAS DE HORTON, for a period of forty years.

In the fourteenth century the monks would probably have attempted a more general transformation of the great church than a remodelling if it were practicable. Four centuries afterwards Bishop BENSON, realising that the piers were not in keeping with the upper parts of the cathedral, proposed to flute them in order to give them a lighter appearance, and the work would be done at his own expense. But it was found that the strength would be greatly diminished, for the Normans had constructed the piers with an exterior lining of dressed stone, while the interior was filled with rubble. The attempt had to be abandoned. The abbots therefore in the fourteenth century commenced their operations at a higher and safer level. In the choir they were able to be more thorough, and it now appears as if that part were entirely an addition of the Perpendicular period. To the Norman builders what would have appeared most of an innovation was the sacrifice of so much solid wall and dim religious light by the substitution of what may be called walls of glass. The windows are of very large area. There are lovers of antiquity who do not approve of this change. E. A. FREEMAN said that he was disposed to add a new count to the articles of deposition against EDWARD II. because the devotion inspired by his remains "has lost us the minster of SERLO in its present form, and hinders us from studying the contrast which we should otherwise have been able to mark between its eastern and its western limit." The work in the choir may, we think, be credited to THOMAS DE HORTON, as well as parts of the cloister. WALTER FROUCESTER completed the cloister. Abbot MORWENT, who reigned between 1420 and 1437, erected the west front and the southern porch. The great tower, of which the condition now gives rise to much alarm, is supposed to have been commenced by Abbot SEABROOK in 1450, and it is believed it was completed in seven years by TULLY, who was one of the monks. It is therefore among the late works, the lady chapel and the chapter-house coming last. The tower would confer dignity on any city, and it may be taken for granted that Gloucester in general will lose no time in taking precautions against all danger to it and the entire cathedral.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at the premises in Tufton Street, Westminster, Mr. John Murray, vice-president, in the chair.

Messrs. J. B. Scott and P. W. Pocock, jun., were elected members.

A vote of thanks was passed to Mrs. James Scott Stewart for a donation of books and photographs.

Mr. G. H. LOVEGROVE delivered a lecture, illustrated by lantern views, entitled—

A.A. Camera and Cycling Club Excursions.

He said:—It has been impossible during the fourteen days at my disposal to prepare a connected, much less a scholarly paper. I therefore propose, in briefly describing some photographs as they are thrown on the screen, to give an idea of the buildings visited by the A.A. Camera and Cycling Club during the past few years. The majority of our members do not make lantern slides, and very few, if any, of the remainder possess a complete set of slides made from the negatives taken on these visits, so that the views shown will only represent a very small percentage of the photographs taken.

The most cherished photograph often proves a disappointment when developed, and again, as our photographs are not taken with the view of forming part of a lantern lecture, very few of a general character will be shown. I have arranged the slides of the various buildings together, but no one building will be exhaustively illustrated. I have also omitted to mention those buildings which are only represented in my collection by one or two slides, in order to avoid change of subject as far as possible.

One of the most beautiful and interesting buildings we have visited is the Priory Church of Christchurch, hard by Bournemouth, containing specimens of every period of architecture, from the early, possibly Saxon crypt, to the Renaissance of its chantries. The church has, as is usual with our larger churches, legends connected with its foundation and construction, but with these I will not delay you. The site is close to the junction of the rivers Stour and Avon on the flat lands, and the first mention of a church here is made in the time of the Confessor. This church, held by a dean and college of secular canons, was swept away by Ranulf Flambard, the chaplain to William II., and it is suggested that before he was appointed to the bishopric of Durham, in 1099, he began the present church, of which part still stands. The earliest existing remains are the nave arcades, the triforium and the transepts, with the eastern apsidal chapel attached to the south transept. Next in date are the walls of the western aisles of about the beginning of the thirteenth century, the clerestory of the nave followed by the vaulting of the western aisles, the north porch and the chapel attached to the north transept. The rood-screen and the reredos belong to the fourteenth century. Early in the next century the lady chapel was completed, and somewhat later the western tower and portions of the choir. From an inscription on the vaulting of the choir we know that this was completed between 1502 and 1520, while later still is the chantry at the east end of the south choir aisle, and in 1541 the famous Salisbury chantry. The stalls and misereres are of various dates from 1200 to 1500.

From Christchurch we visited Wimborne Minster, a comparatively small building containing a great many interesting details, but, owing to the journey and the church services, very little time was left for photography. At the western end of the late Norman nave several bays were inserted in the fourteenth century when the church was lengthened. The choir is mainly of thirteenth-century date. The east window, which is impossible for photography from the exterior, is illustrated in Parker's "Introduction to Gothic Architecture." This portion of the building covers a crypt reached from the aisles through an archway, over which is the beautiful tomb to John Beaufort, who died in 1444. The label stops on the arches over the entrances to the crypt are of great interest. The sedilia, which are of very great beauty, unfortunately are not illustrated. No one visiting Wimborne should miss the museum in the celebrated chained library.

With the modern facilities for cheap travel a week-end in Belgium is of small moment, for one can leave London at 9.0 P.M. and be photographing in Bruges by 4 A.M. next morning. The street opposite the station takes us past the cathedral to the Market Square, one side of which is formed by the Cloth Hall and its celebrated belfry. The Cloth Hall was built in the thirteenth and fourteenth centuries, and altered in 1561. The courtyard contains some interesting Renaissance detail. The eastern wing holds one of the most remarkable collections of local relics it has ever been my good fortune to visit, and several days could be spent in studying the specimens of iron hinges, door handles, &c., apart from the other exhibits. The belfry was begun in 1282 and finished at the close of the fourteenth century. The statue over the entrance represents the Madonna. Continuing along the south side of the Square we reach the town hall, begun in 1376 and restored in 1871: adjoining is the old municipal record office, built in 1535, and now the law courts. The façade is gilded over the greater portion of its surface and so presents great difficulties to the photographer. Passing under the archway of the record office we reach the Quai de Rosaire, adjoining the fish market, and many interesting photographs may be taken. Continuing along the back streets we reach the church of Notre-Dame, opposite the Memling Museum, the most interesting portion of which is the old north porch. A walk along the canal encircling the city brings us to the various gateways. From Bruges a cross-country railway journey brought our party to Ypres, a grass-grown city surrounded by ramparts. The most interesting features, apart from one or two houses, are grouped round the cathedral and Cloth Hall. As it was Sunday when we arrived the cathedral was left untouched, but the Cloth Hall, completed in 1304, provides an abundance of subjects. Over the entrance through which the cathedral square is reached stands a statue of John I. of Brabant. The interesting way in which monotony in so long an elevation is avoided by the alternate use of blank windows filled by statues should be noted. Adjoining the Cloth Hall is the town hall, erected during the sixteenth century, the ground floor being an open arcade about 20 feet wide surrounding a vaulted hall. Behind and adjacent to this is the Conciergerie, perhaps the most interesting building in Ypres. Passing under the arcade we see the side elevation of the Conciergerie to the cathedral square, and the cathedral tower with the Cloth Hall in the background. The domestic buildings in Ypres are uninteresting compared with those in Bruges or Ghent; the best example is found at the end of the town furthest away from the station.

We now come back to England and visit Peterborough. Approaching the cathedral from the station one passes the Guildhall, built in 1671. Immediately opposite the entrance to the Close we see the west front erected probably about 1238, the porch being a fifteenth-century addition to support the central piers. The Deanery gateway, built about 1520, is of considerable interest, owing to the carvings of the arms and the rebus of the prior (Robert Kirkton), the Tudor rose and portcullis, the Prince of Wales's feathers and the triangle of the Trinity. To the south of the cathedral are the ruins of the cloisters, whence may be seen the grouping of the western towers. At the east end is the "new building," 1438-1528, from which until the seventeenth century the lady chapel projected. The nave was commenced about 1117, and is of unusual length. It is uncertain whether the Norman west front was ever completed. The font of thirteenth-century date is placed in the south-western transept. The eastern transepts and the tower are ceiled like the nave with wood, the bosses in the crossing being very finely carved. The transepts are of similar date to the choir, but the eastern and western arches of the crossing are of the fourteenth century. The choir contains in the triforium the earliest example of tracery; the marble paving and the baldachino were completed in 1894. The aisles of the choir contain some details of interest, such as the double piscina in the north and the ruined monument in the south. The three remaining misereres of Mediæval date are fastened to a board in the south choir aisle. The new building was erected beyond the apse at the end of the eighteenth century, and is the width of the choir and aisles together.

Within easy reach of Peterborough is Stamford, a fascinating town containing many interesting houses and magnificent churches, while those interested in the work of John Thorpe may study Burghley House, of which he is supposed to be the architect. Its style, however, did not please the fancy of our members, and no photographs were taken. Close to the hotel in St. Mary's are several small houses of interest, as also in St. Martin's on the road to one of the entrances to Burghley Park, but to the Mediævalists All Saints Church is the chief attraction. Almost every capital in the church provides a distinct subject; the roof corbels, vaulting-bosses and almost every portion of the church are worthy of record. St. Leonard's Priory, on the outskirts of the town, and now used as a barn, is of great interest. A short drive from Stamford on the Oundle road is Warmington, where St. Mary's Church provides a day's work. The building, including the wooden groining of the roof, is of thirteenth-century date throughout. One mile from Peterborough is Thorpe Hall, where Colonel Strong kindly gave us free access to every portion of the building. According to Mr. Blomfield, the house was commenced from Webb's designs shortly after the death of Inigo Jones, and is dated 1656. The design is directly inspired by Inigo Jones, and is uninfluenced by Wren.

Greenwich Hospital has been visited twice by our members, and is always a source of interest. When Wren commenced work here there were two buildings on the site; the house facing the park, designed by Inigo Jones, and the unfinished palace begun by John Webb from designs by Inigo Jones for Charles II. Wren completed King Charles's block, and making the queen's palace the centre at the extreme south, designed two courts with colonnades facing each other running northwards towards the river until they joined the great court, the west side of which was already occupied by King Charles's block, opposite which he built Queen Anne's block. The junction of the colonnades with the great court was marked by two domes surmounting the entrances to the chapel on the east side and the hall on the west. Hawksmoor continued the building of the south-western or King William's block, and it was finished by Vanbrugh.

Among the City churches we have visited Christ Church, Newgate Street, and slides are shown of the litany desk formerly the door of the reading desk, the panels of

Digitized by Google

which now make the front of the choir stalls. These have all been cleaned, and present an entirely different appearance from the pulpit. The font of St. Stephen's, Walbrook, is of great beauty, and offers a more successful subject to the photographer than the body of the church, which is too small in area for work with the camera. The font at All Hallows, Lombard Street, can be taken by artificial light, but the church is far too dark for successful exposures.

Hereford forms an excellent centre for a visit, although the town itself contains little of interest except the houses formerly known as Butcher's Row. The cathedral tower is profusely ornamented with the ball flower, but owing to the condition of the stone the larger part of the exterior has been refaced, and the chief points of interest are the north transept tower and the north porch. The cloisters are almost all new. The south transept seems to have been built about 1115 and the north in 1240 by a foreign bishop, whose tomb is in the aisle of the north transept, where also is the temporary resting-place of an effigy with beautifully carved robes, of Bishop Westphaling, who died in 1620. The font is of about twelfth-century date, and is carved with the figures of the Twelve Apostles; the lions supporting the base are of exceptional interest. The nave arcade is of great beauty, but it has suffered both accidentally and at the hands of Wyatt and other restorers, and practically above the crown of the arches has been rebuilt at one time or other.

The chief points of interest in Ludlow are the castle, the church and the Feathers hotel, where many subjects are ready to hand. As it was Sunday when we visited the place we could not obtain admission to the church. To the east of the church is the Reader's House, an early seventeenth-century building in half timber.

Ledbury, of which I have but two slides, is a charming village filled with good buildings. The market house is one of the easiest to photograph, and certainly the most striking. At the top of the town is Sir Michael Biddulph's house, of great size and interest. From Hereford we drove to Kilpeck, where the remains of the castle and the little Norman church were visited. The church, as is well known, was rebuilt in 1848 stone by stone, but nothing was recent, and new stones were not used, except the one in the tympanum of the south door. The remarkable freshness of the carving is a striking contrast to the condition of the stone at Hereford and Ludlow.

The few slides I have shown will give some idea of the extreme variety of the architecture visited, and I believe studied, by the members of the Camera and Cycling Club during the past few years. I have omitted, owing to want of time, illustrating several of our most interesting visits, such as those to Gloucester and district, Hampton Court and Morden College, for it would be easy to occupy several evenings with accounts of our excursions. In conclusion, I would point out that the excursion to Winchester next Easter will be open to all members of the A.A., and that those who go will find that the members of the Camera and Cycling Club form a very sociable section of the Architectural Association.

Mr. MATT. GARBUTT, in proposing a vote of thanks to the lecturer, said Mr. Lovegrove had proved himself to be an interesting guide to buildings that were familiar to most architectural students.

Mr. E. W. WONNACOTT, who seconded the motion, said he had no remarks to offer because they had had merely a stop-gap lecture. He could sympathise with Mr. Lovegrove in what he had done at short notice. It was a difficult task, and speaking from personal experience the speaker thought it generally a thankless one. Referring to the Architectural Association's excursions, his advice to ardent members could be summed up in two words, "Try them."

Mr. W. J. LEVERTON supported the vote of thanks.

The CHAIRMAN, in conclusion, said their thanks were due to Mr. Lovegrove for having prepared an interesting lecture at such short notice. Photography was undoubtedly a considerable aid to the study of architecture, and they had seen the vast field that awaited the student. The lecture did not offer points for discussion, but he hoped that in the future they might have, at not infrequent periods, papers of the same kind, but with longer notice given for their preparation.

Mr. J. Riley, chief assistant engineer to the Bloemfontein Town Council, has been appointed town engineer of Germiston at a salary of 600*l.* per annum.

NORTHERN ARCHITECTURAL ASSOCIATION.

THE annual meeting of the Northern Association was held under the chairmanship of Mr. J. T. Cackett (president) on the 7th inst.

The report of the Council for the forty-sixth session was read by the honorary secretary, Mr. A. B. Plummer. The report expressed the pleasure of the Council in again recording the increased success of the Association. During the session, and since the last report, two members, nine associates and fourteen students were elected, as compared with nine members, ten associates and thirteen students during the previous twelve months. The roll of students for 1906 was as follows:—Members, 78; associates, 72; students, 70; total, 220. The Association recorded with regret the death of Mr. Francis Caws at his residence in Sunderland. The report stated that Mr. Caws was a prominent architect, two of his principal works being the suspension bridge at Stanhope and the shed at Messrs. Swan & Hunter's Wallsend shipyard, under which the largest vessel in the world is being completed. Sympathetic reference was also made with reference to the late Alderman W. H. Dunn, of Gateshead.

The report of the treasurer showed a total income of 271*l.* 2*s.* 8*d.*, the cash balance from 1904 being 79*l.* 2*s.* 7*d.* The total expenditure amounted to 267*l.* 8*s.* 7*d.*, leaving a balance in hand of 3*l.* 14*s.* 1*d.* It was stated in the annual reports of the students' sketching club and the students' classes club that the memberships were twenty-two and twenty-nine respectively.

The hon. librarian's report stated that the books in the library had been in great demand. There had been a number of valuable additions to the collection.

The drawings submitted for the Northern Architectural Association competition were exhibited. Mr. Bryan Watson was successful in securing the Glover bronze medal. Only one set of drawings, however, was submitted for this competition.

The award of the assessors in connection with the essays competition was read by the Chairman, who expressed his regret at noting that there had been only two competitors that year. The two entrants were placed as follows:—Mr. William Stockdale (under the motto of "York"), of North Shields, 1; Mr. Arnold Sutherland Constable ("Essayez"), of Stocksfield-on-Tyne, 2.

On the proposition of the Chairman, a vote of thanks was accorded to the honorary secretary, Mr. A. B. Plummer, for his services to the Association, it being also decided to record in the minutes appreciation of Mr. Plummer's work in connection with the alterations to the Association's premises.

The President intimated that considerable interest was being shown in regard to his suggestions for the proposed alteration of New Bridge Street. He believed that his ideas would influence the City Council in their line of policy in reference to the alterations.

ARCHITECTS' BENEVOLENT SOCIETY.

THE annual general meeting of the above Society was held in the rooms of the Royal Institute of British Architects on Friday, the 9th inst., Mr. J. Macvicar Anderson in the chair. The honorary secretary read the report of the Council, in which they express regret that, judging by the number of claims made upon the Society, the past year seems to have been one of exceptional difficulty for many of the less fortunate members of the architectural profession. It was found, moreover, that the demands made upon the Society were beginning to outweigh the funds at the disposal of the Council, and the president (Mr. John Belcher) acceded to a suggestion that he should issue a personal letter of appeal which was sent out to 5,280 architects practising in the three kingdoms. He directed attention to the fact that although this Society had been in existence for over fifty years, and was the only Institution organised specially for the relief of architects or their widows and orphans, not more than 1 per cent. of architects in active practice contributed to its support. As the income had suffered in recent years from the loss of many liberal contributors, the President appealed particularly for subscriptions, and as a result they have been increased some 20 per cent., while a considerable sum has been added to the capital. In connection with the appeal, the Council call special attention to an offer of a donation of 50*l.* by Mr. Walter Emden, if nine other contributions of an equal amount are received, but so far the offer has been

Digitized by Google

only supported by Mr. W. Glover, Mr. H. Chatfeild Clarke and the Society of Architects.

In moving that the report and statement of accounts for the year 1905-6 be received and adopted, the Chairman said that in some respects the report seemed to him satisfactory, inasmuch as the subscriptions have increased, although the fact remained that the efforts recently made in that direction have only been partially successful, and he ventured to hope that Mr. Emden's offer would be fully responded to. The motion having been seconded by Mr. H. L. Florence, was carried unanimously. A vote of thanks, proposed by Mr. A. Ashbridge and seconded by Mr. G. Scamell, was next accorded to the retiring members of the Council. The election of Council for the ensuing year was moved by Mr. Andrew Taylor and seconded by Mr. A. O. Hills. The following is the complete list of the Council :—

Mr. John Belcher (president), Mr. W. Glover (vice-president), Mr. Rowland Plumbe, Mr. G. T. Hine, Mr. Ambrose M. Poynter, Mr. William Grellier, Col. R. W. Edis, C.B., Mr. H. L. Florence, Mr. G. B. Bulmer, Mr. F. W. Hunt, Mr. W. L. Spiers, Mr. A. Ashbridge, Mr. W. Emden, Mr, Reginald St. A. Roumieu, Mr. H. Chatfeild Clarke and Mr. A. Saxon Snell.

A cordial vote of thanks to Mr. W. Hilton Nash for his past services, and re-election as honorary treasurer of the Society, was moved by Mr. Christopher and seconded by Mr. Rowland Plumbe. In response Mr. Nash said that it had been to him a labour of love for some years, and it was a matter for congratulation that they had been able to give away last year the largest sum of money during the term of the Society's existence, and they had increased their capital. He urged that they should all try to influence new members to join the Society.

A cordial vote of thanks to Mr. Percivall Currey for his past services and his re-election as honorary secretary was moved by Mr. Rowland Plumbe and seconded by Mr. Christopher. A vote of thanks to the auditors, Messrs. Perks & Greenop, and their re-election for the ensuing year, was moved by Mr. Grellier and seconded by Mr. Spiers.

Mr. Nash then moved, and Mr. Spiers seconded, that the following be inserted after By-law No. 7 :—"Societies and corporate bodies who are now or may become annual subscribers of not less than ten guineas, or donors in one sum of not less than fifty guineas, shall be entitled to be represented on the Council by their President or Chairman for the time being, who may also vote at all general meetings and shall be entitled on behalf of his Society to the same privileges as those of individual donors or subscribers."

This having been carried unanimously, as also were the other resolutions, a vote of thanks to the Royal Institute of British Architects for the use of rooms in which to hold their meetings and for office accommodation was moved by Mr. H. L. Florence and seconded by Mr. Nash.

The proceedings concluded with a hearty vote of thanks to Mr. Macvicar Anderson for presiding at the meeting, and for the great interest which he had always shown in the Institution.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

AT the rooms of the above Society on Thursday, the 8th inst., Mr. H. Phillips Fletcher read a paper on the "St. Louis Exhibition," Mr. G. B. Bulmer in the chair. The lecturer said :—It is possible that some few of us are but dimly aware of the great event which the World's Fair at St. Louis commemorated. It was the centenary of the purchase of the Louisiana territory from Napoleon by the United States Government. The first organised action for the holding of the exposition was taken in 1898, and it was determined in the typical American fashion to make it the "biggest" ever held in the history of the world. Fifteen million dollars was the amount of capital which was proposed for the financing of the enterprise. Five million dollars of this was raised by public subscription from the citizens of St. Louis, five millions by the issuing of City bonds, and the remaining five millions was appropriated by the United States Government, together with the support of the latter. Later this capital had to be considerably augmented. The site chosen for the exhibition was a good one, being situated on the western limits of St. Louis. In all there were over 1,240 acres, 250 of which were roofed in. The general scheme of the plan was designed by a committee of American architects, amongst whom were such men as Cass Gilbert, Carrere, Hastings, Hames and Link, and it resembled a lady's open fan. The centre of the picture, or what may be likened to the handle of the fan, was the festival hall, situated on the top of the hill. Flanking the festival hall on either side was the colonnade of states, formed in a crescent, with a restaurant pavilion at each extremity. The face of the hill in front of these was terraced, and three series of cascades discharged 90,000 gallons of water per minute into the grand basin at the foot. From the hill as the focal point three main avenues radiated like the ribs of a fan, offering a vista terminated with the highly decorative features of the festival hall and the colonnade of states. A grand transverse avenue crossed three main avenues, and gave the general outline to eight of the main exhibit buildings. The lecturer then described the engineering of the exhibition. The construction of the main buildings was under the control of the division of works, and it was decided to erect these in timber partly owing to the then congested state of the steel market and partly to save expense. Internally, the buildings were intended to be finished in plaster, but this and much of the colour scheme for the exteriors had to be omitted owing to lack of funds. Some idea of the enormous size of the exhibition may be gained from the fact that the average height of the cornice level to the buildings was 60 feet from the ground. The lecturer then described in detail the festival hall, colonnade of states, restaurant, pavilions, cascades and gardens, United States Government building, mines, liberal arts, education, manufactures, electricity, varied industries, machinery, transportation, agriculture, horticulture, forestry, administration, Washington State and foreign buildings. Perhaps one of the most surprising facts of all the wonders of the World's Fair was that with all the inventive genius at the disposal of the American race, so few original architectural efforts were made. The architects of the mines and transportation buildings alone made any attempts at conceiving original designs.

Mr. Fletcher in his lecture dwelt especially upon the great success that attended the efforts of the British craftsmen and manufacturers, and stated that the technique and finish of their exhibit were far superior to those of any other nation, though as regards modern design in conjunction with modern requirements we were not so successful. He specially mentioned the fine exhibits of Messrs. Waring & Gillow and Messrs. Trollope & Sons and Colls & Sons, who were recipients of grand prizes. Nearly 700 awards were made to representatives of the Mother Country. Much of the success of the exhibition from a British point of view was due to the ability and organising efforts of Colonel Sir Charles Watson, R.E., K.C.M.G., C.B., who succeeded in having the British sections ready and the catalogues completed by the opening day, a feat that was not accomplished by any other nation.

The lecture was illustrated by lantern slides.

The following officers were nominated for the ensuing session :—President, Mr. H. S. Chorley, M.A., A.R.I.B.A.; vice-presidents, Messrs. P. Robinson (F) and S. D. Kitson, M.A. Hon. treasurer, Mr. G. F. Bowman. Hon. librarian, Mr. F. Musto (A). Hon. secretary, Mr. A. E. Kirk (A). Members of Council—Messrs. W. G. Smithson (A), F. E. P. Edwards (F), C. B. Howdill (A), H. A. Chapman (A), A. R. Hill (A) and G. E. Reason (Assoc. Member).

EDINBURGH ARCHITECTURAL ASSOCIATION.

A MEETING of the Edinburgh Architectural Association was held on the 6th inst., when a paper was read by Mr. R. S. Lorimer, A.R.S.A., architect, on "Scottish Gardens and Garden Architecture." In the course of his remarks, Mr. Lorimer laid stress on the fact that there was at the present time a great interest taken in gardens. He gave a sketch of the development of garden design in Scotland, and spoke of the relation between the garden and the house. A historical account was given of some of the principal gardens in Scotland, and these were described, and Balcaskie in Fife was instanced as the ideal of what a Scottish country gentleman's garden ought to be. It was a fine specimen of a terrace garden. The lecture was illustrated by lantern slides, which showed some of the gardens of Scotland, and their sculpture and architectural setting, and another series illustrating some foreign—French and Italian—garden sculpture.

Charing Cross Railway Station will be reopened for traffic on Monday. The structural alterations in progress will prevent a full service of trains.

NOTES AND COMMENTS.

IT is generally known that Trinity College, Dublin, which is the University, stands on ground which at one time was occupied by the monastery of All Hallows. There exists, it appears, a plan at Hatfield House on which the monastery is represented as a large square, with a steeple on the north side. What is not known to all the inhabitants of Dublin is that a river ran down Grafton Street by the monastery, and that the fall was sufficient to turn a mill. Sir THOMAS DREW, in the course of the excavations for the new college buildings, discovered remains of a landing-place, which would suggest that the monks were able to bring boats from the river Liffey. The river must have been of some extent, for during a flood a wall was overturned. College Green was in the sixteenth century of a much larger area than it is at present. Sir GEORGE CAREY obtained part of it in 1602 as a site for a mansion, which was afterwards taken down and the Houses of Parliament, now the Bank of Ireland, erected on the site. Various other encroachments followed, and there is little doubt the present open space would have been much diminished if it were not for the opposition of the students.

ACCORDING to the Northern Farmer, "Proputty, proputty's ivrything 'ere." BLACKSTONE put it in another way by describing it as a right inherent in every Englishman. By English law it is divided into real and personal, and in Scots law it is either heritable or movable. Mr. WEMMICK, of "Great Expectations," had for a guiding star the maxim, "Get hold of portable property." Now we know from BLACKSTONE that we can also have property of an unsubstantial kind, such as certain rights and privileges. In modern times electricity would appear to come under that class, for although it can exercise enormous power both of construction and destruction, he would be a bold man who would describe it as substantial. It cannot be considered as real property, and therefore by English law must be considered as personal. Such is the conclusion which has been arrived at by the California Court of Appeal. A water company entered into a contract with a light and power company for the delivery of electricity. When, after going through the lower Courts, the case came before the higher Court, it was decided that as property which is not real must be personal, electricity must be regarded as personal, and as such there was a breach of contract in not delivering it as agreed on.

THE case of FREDERICK BETTS, LTD., *v.* PICKFORDS, LTD., contains some expressions of judicial opinion of interest to architects. The plaintiffs had leased from the defendants a plot of land for the purpose of building thereon a warehouse and show-rooms, the plans of which had been approved by the defendants. These plans showed that the first floor of the warehouse was designed as a show-room, and that it had three windows in the south wall overlooking the defendants' premises. This south wall was meant to be an external wall and not a party wall. The defendants undertook to demolish some old buildings which occupied the site of these projected new buildings. They demolished them, but left a cart shed on the borders of their land, the roof timbers and cross stanchions of which projected 4 inches over the boundary. These roof timbers and stanchions were, with the consent of the plaintiffs' architect, but without the express authority of the plaintiffs, built into the south wall of the plaintiffs' warehouse. Consequently the district surveyor served a notice upon the plaintiffs under the London Building Act 1894 requiring all three windows in the south wall to be bricked up, on the ground that it had been converted by the defendants' user into a party wall. The plaintiffs then applied for an injunction against the defendants to restrain them from using their wall as a party wall. Justice KEKEWICH held that they were entitled to this relief. The defendants had granted the land to the plaintiffs for a specific purpose which had been approved by them, and they could not derogate from their grant. They were clearly derogating from their grant by using the plaintiffs' wall in such a way that it became legally impossible to retain the windows in that wall, and, consequently, to use the room for the purposes for which it was designed. It was argued that the plaintiffs' architect had consented to this user. But the learned Judge held that in thus consenting the architect had gone beyond the scope of his authority. "He was employed simply to superintend the erection of the buildings." The plans showed no such timbers or stanchions built into the wall, and "he had no authority to allow the slightest deviation from the plans. An architect in the absence of special stipulations had no greater authority than any other person who was employed to superintend work." The moral seems to be that the law allows to architects considerably less latitude than it allows to other professional persons; and that, if this is the law, architects before allowing any deviation from plans must be careful to see that they have authority to make such deviations.

THE Thorwaldsen Museum, which adjoins the royal castle in Copenhagen, is decorated on the exterior walls with figures in cement which have been painted. They represent the festivities with which the sculptor was received in the city, and the bringing of his works to the museum. There are, it is supposed, about 300 examples of THORWALDSEN'S sculpture. The air of Copenhagen is not favourable to colour, and those works have become more dark than is desirable. Of late years attention has been given to the subject, and various proposals have been made about superseding the cement figures. Mosaic has been tried as a background, but the experiment was not successful. Fresco was also attempted, and it too has failed. Recently a professor of chemistry has been called in, and he proposes to remove the original colours and then to repaint the figures with others which will be more enduring. At present this last expedient appears to be in favour. The museum was built between sixty and seventy years ago, and is partly Egyptian, partly Etruscan, in style. The buildings are ranged around an open court, in which is the tomb of the sculptor. The interior is decorated in Pompeiian style, and the classical subjects of THORWALDSEN are therefore to be seen amidst suitable surroundings.

ILLUSTRATIONS.

VILLA OF THE BARON ARTHUR V. OSTERROTH, COBLENZ.

THIS illustration shows the view of the villa of the Baron ARTHUR VON OSTERROTH in the Mainzerstrasse of Coblenz. It will be observed that the architect, Herr WILLY BOCK, has adopted a somewhat different type from those we have given, but one no less faithful to the principles of the old German builders. The house is detached, and each side presents a different appearance, that towards the street, as shown in the illustration, complying with the building regulations of the city. Sculpture has been largely introduced and is of a high class, imparting dignity to the house while recalling history and legend. The materials have also been selected with a view to colour which, although successful, cannot be suggested by the illustration. As seen from the garden the villa appears as a country house; from the street it is a town house, but of a character which is unique.

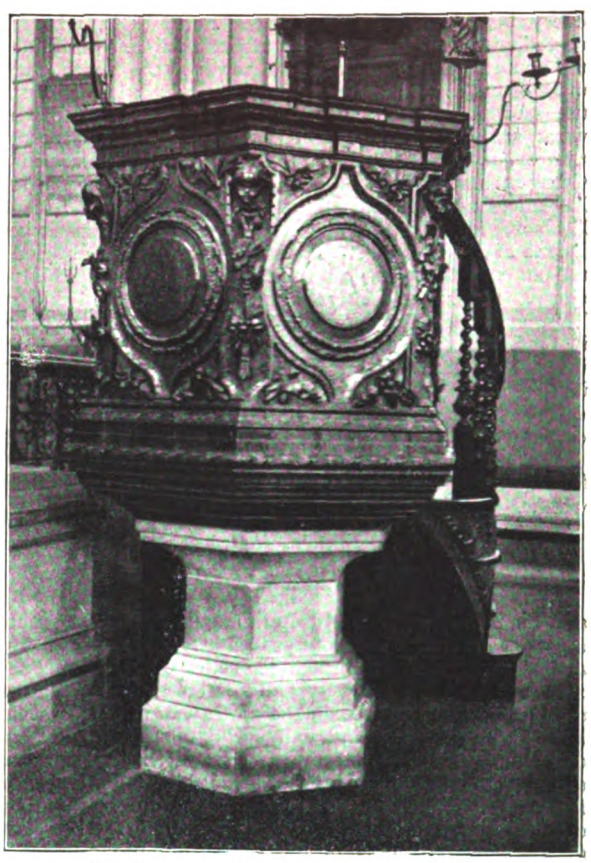
TWO CITY CHURCHES.*

St. Andrew Undershaft.



THE present church of St. Andrew Undershaft was commenced in 1520 and completed in 1532. John Stow was born in 1525 and died in 1605; his "Survay of London," written in 1598, describes the church as still retaining the name of St. Andrew Undershaft: the historian of London just 300 years later can say precisely the same thing. John Stow must have had an intimate knowledge of the church. He lived a few yards from it, he was born five years after the rebuilding commenced, and was seven years old when it was completed; finally, he was buried within its walls on April 8, 1605. The dates mentioned occur within the reigns of Henry VIII., Edward VI., Mary, Elizabeth and James I.; under these sovereigns Stow lived. The church was built wholly in the reign of Henry VIII., at the period when English Gothic architecture had reached its zenith and was passing through its final stages, preparatory to the revival of Classic ideals in what we term Jacobean art. The church has not been altered since its erection, with the exception that the tower has been heightened, so that we see it just as it was in Stow's time, if we except the pews and a few of the monuments.

Let us take him for our guide as we endeavour to picture the immediate neighbourhood of this church. When twenty-four years old he was living near the well within Aldgate,

ST. ANDREW UNDERSHAFT.

and, referring to a farm belonging to the nuns of the abbey of St. Clare, the Minoresses, he says:—"At the which farm I myself in my youth have fetched many a half penny worth of milk, and never had less than three ale pints for a halfpenny in the summer, nor less than one ale quart for ahalfpenny in the winter, always hot from the kine, as the same was milked and strained. One Trolop, and afterwards Goodman, were the farmers there, and had thirty or forty kine to the pail. Goodman's son, being heir to his father's purchase, let out the ground first for grazing of horses, and then for garden plots, and lived like a gentleman thereby." So late as the beginning of the nineteenth century milk could be obtained from this farm, and the present existing names of Goodman's Yard, Goodman's Fields and Goodman's Stile and the "Gap" (in the hedge, probably) are a striking survival of this interesting piece of local history. Returning from Goodman's farm with his can of milk, our future historian would pass the abbey of St. Clare (already surrendered to the king ten years previously), the small parish church of the Trinity, St. Botolph's Church; then he would cross the bridge over the Hound's Ditch, through the Aldgate in the Roman wall into the ward of Aldgate. Passing along Aldgate Street he would see on his right the magnificent priory of Holy Trinity, also just dissolved by the king, and given by him to his favourite, Sir Thomas Audley, Knight and Lord Chancellor. In the cemetery of this great priory stood St. Katherine Christ Church, and, having already passed St. Michael, Aldgate, he would come to "the fair and beautiful parish church of St. Andrew the Apostle." He would not see the famous May-pole which had caused the church to be called St. Andrew-under-the-Shaft, for that had not been raised since 1517. The occasion which led to its disuse Stow gives somewhat in detail:—"Every year on May-day in the morning it was used that an high or long shaft, or May-pole, was set up there in the midst of the street before the south side of the said church; which shaft, when it was set on end and fixed in the ground, was higher than the church steeple." He goes on to quote Geoffrey Chaucer, whose works he edited in 1561, "As ye would beare the great shaft of Cornehill," and tells us that "Evil May-day" was the last occasion on which the shaft was raised. The alien ques-

ST. ANDREW UNDERSHAFT. PULPIT.

tion existed then, as now, and in the same neighbourhood, for "Evil May-day" was "so called of an insurrection made by apprentices and other young persons against aliens in the year 1517." The shaft was laid along over the doors, and under the pentises of one row of houses and alley gate, called Shaft Alley; it was hung on iron hooks until 1549, when, having been duly denounced at Paul's Cross as idolatrous by a scatter-brained curate of St. Katherine Cree, the people living in its vicinity, "after they had well dined to make themselves strong, gathered more help, and with great labour raising the shaft from the hooks, whereon it had rested two-and-thirty years, they sawed it in pieces, every man taking for his share so much as had lain over his door and stall, the length of his house, and they of the alley divided among them so much as had lain over their alley gate." This same "Evil May-day" is referred to in the "Chronicle of the Grey Friars of London," where we are told that "thys yere was yell May Day, that yong men and prentes of London rose in the nyght, and wolde have had James Mottas ane owte-landych mane and wolde have slayne him, but he hyde hym in hys gotters in hys howse." The upshot of the riot was that "at the last there were dyvers of them hongyd within the citte on gallos,

* Read by Mr. Theophilus Pitt, F.C.S., at a meeting of the Upper Norwood Athenæum on Saturday, February 24.

Digitized by Google

as at Sent Martyn's gatte at Ludgate, at Algate, Bysshoppes gate, Doggate, Sent Mangnus, Ledynhall, in the Powltre, and at the stondert in Cheppe." So serious was the riot that those who were pardoned had to come with halters round their necks to the king sitting in Westminster Hall.

The church is dedicated in the name of the apostle St. Andrew, who was martyred at Petra, it is said, upon a cross whose shape has been adopted as the symbol of the apostle, a cross *saltire*. There were two other dedications in this name in the City, St. Andrew by the Wardrobe and St. Andrew Hubbard; the latter church no longer exists. Stow records the names and merits of many of the most noteworthy of London citizens who had endowed churches, schools, almshouses, and rendered service to the poor. He mentions the name of Steven Gennings, or Stephen Jennings, Merchant Taylor and Mayor in 1509. Gennings founded a fair grammar school at Ultrimhampton (Wolverhampton), left good lands, and also built a great part of his parish church of St. Andrew Undershaft. Stow further tells us that in the building of the church every man put to his helping hand, some with their purses, others with their bodies, and that Steven Gennings caused at his charges to be built the whole north side of the middle aisle both of the body and choir, as appeareth by his arms over every pillar graven, and also the north aisle, which he roofed with timber and ceiled; also the whole south side of the church was glazed, and the pews of the south chapel made of his costs, as appeareth on every window and upon the said pews. Gennings died in 1524, long before the work was finished, and was buried in the Greyfriars Church, of which the last remnant has just disappeared. Other men who assisted in the cost of building were John Kerkbie, Sheriff and Merchant Taylor, and Nicholas Levison, Mercer, the ancestor of the Leveson-Gowers, Dukes of Sutherland. Amongst those who were buried in the old church, as recorded by Stow, were Philip Malpas, sheriff, 1439; Sir Robert Dennie, knight, and his son Thomas, 1421; and Thomas Stokes, gentleman and grocer, in 1496. Of this old church nothing is known, except that it was built in 1362. Further work was done in the church in 1627 and 1704, new wainscotting and pews were added and the fabric was beautified, to use the term so frequently employed in this connection in the eighteenth century.

The monuments of the church are interesting, and the foremost is that of John Stow, erected to his memory by his widow. It bears the legend—

Aut. scribenda. Aut. legenda.
Agere. Scribere.
Memoria Sacrum,

and an inscription, also in Latin, setting forth in graceful language his claims upon our gratitude for his great historical and topographical labours. Those who were present at Stratford-on-Avon last year will remember the monument to William Shakespeare on the north wall of the chancel of Holy Trinity Church, and will see a marked similarity in this memorial of his contemporary Stow, the same position, the pen in the right hand. Sir Hugh Hammersley, Lord Mayor 1627, buried here in 1636, is commemorated by a monument supported by two weeping soldiers. His claims to the notice of City posterity are numerous. He was "colonel of this City [which probably explains the presence of lachrymose military], president of Christ's Hospital, president of the Artillery Garden, governor of the Company of Russia Merchants and of those of the Levant, free of the Company of Haberdashers and of Merchant Adventurers of Spain, East India, France and Virginia." Sir Christopher Clitherow has a tablet, also on the north wall; he was sheriff, M.P. for the City, lord mayor in 1635 and died in 1642. Boston manor-house, in the Boston Road, lying between Brentford and Hanwell, contains a fine portrait of Sir Christopher by Garrard. It is over the door of the antechamber to the State bedroom; there are also two portraits of his wife, Dame Mary—one by Zucchero, the other a replica. A most interesting account of Boston manor-house and the Clitherows may be read in the *Home Counties Magazine*, vol. v. The glass in the west window, which has portraits of Edward VI., Elizabeth, James I., Charles I. and Charles II., is understood to have been given by Sir Christopher Clitherow; but it was removed from the east window, where it was originally placed, in the restoration of 1875-6 under Sir A. W. Blomfield. Up to that time the west window had been blocked up and the east window is now entirely modern. Alice Byng, with ruff, kneeling at a prie-dieu, died in 1616. She was the daughter of Simon Burton, citizen and wax-chandler, whose brass plate is close by, and had three husbands, "all batchellors and stacioners." In the chancel is the monument of Sir Thomas Offley, Lord Mayor in 1556. He died in 1582, and Stow says that he bequeathed the one-half of all his goods to charitable actions, but the parish received little benefit thereby. A brass to Nicholas Levison and his wife Denys on the east wall of the north aisle, accompanied by the figures of ten daughters and eight sons, is of great interest.

Books which have been attached by chains are very rare in the neighbourhood of London. Great Yarmouth parish church has perhaps the best collection, and Waltham Abbey has an eye in one of the Norman piers to which a chained book was attached. St. Andrew Undershaft has seven old books, some with portions of chain attached. There is Sir Walter Raleigh's "History of the World," Erasmus's "Paraphrase of the Books of the New Testament," a book by Bishop Jewel and one by William Perkins, and three copies of Foxe's "Book of Martyrs." Hans Holbein is commemorated by a modern brass tablet in the south aisle. There is no record of his burial here, but he was probably living in the neighbourhood at the end of his life, as he is described as "nuper parochiæ sancti Andree Undershafte" in the probate of his will, dated November 29, 1643.

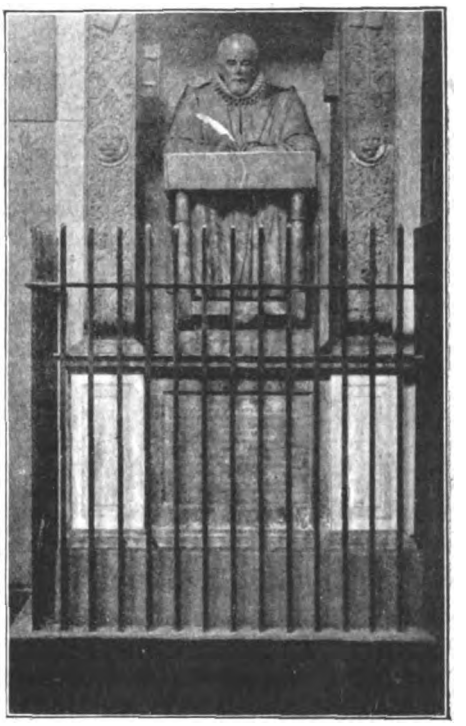
St. Katherine Cree.

It is somewhat difficult to say whether the earliest church on this site was older than the great Augustinian priory of Holy Trinity close by, but there is some ground for this view in Stow's statement that the priory was made into one parish of the Holy Trinity, to include the parishes of St. Mary Magdalen, St. Michael, St. Katherine and the Blessed Trinity, and that it was "built on a piece of ground in the parish of St. Katherine towards Aldgate." The priory of Holy Trinity, Aldgate, one of the most extensive foundations in London, was founded by Queen Matilda, wife of Henry I., as Stow says, "in the place where Siredus sometime began to erect a church in honour of the Cross and of St. Mary Magdalen, of which the Dean and Chapter of Waltham were wont to receive thirty shillings." The relation to Waltham is interesting, for the dedication of that church is in honour of the Holy Cross, and this was probably a cell served by the abbey of Waltham. The priory church of Holy Trinity was known as Christ's Church, and since there were other churches dedicated in honour of St. Katherine in the City and its outskirts, the church we are considering now was called St. Katherine Christ's Church, or Cree Church, because of its proximity to the more widely-known Christ Church, Aldgate. Strype gives the date of the early church as about the year 1300, but Mr. Philip Norman records its mention in the bull of Pope Innocent III., who died in 1216, and in a will dated 1349, so that as chapel or parish church its existence may go back to Norman times at least. When the priory of Holy Trinity was surrendered to Henry VIII. in Stow's time, Sir Thomas Audley, to whom it was given by the king, had no use for the church of the priory, so he offered it to the parishioners of St. Katherine in exchange for their own parish church, so that he might build secular property on the site of the latter. The people of St. Katherine's declined the offer, having doubts in their heads of "afterclaps," so they stuck to their own parish church and allowed Sir Thomas Audley to pull down the priory and build upon its site a residence for himself. He died in 1544; his daughter and heiress married the Duke of Norfolk, and the mansion was called the Duke's Place.

The present church of St. Katherine possesses interesting evidences of its predecessor on the site. John Stow says of the church which stood here in his day (the present church was built nearly thirty years after his death):—"This church seemeth to be very old, since the building whereof the high street hath been so often raised by pavements that now men are fain to descend into the said church by divers steps, seven in number." It will be remembered that other churches in the City have this feature—St. Helen, Bishopsgate, and St. Olave, Hart Street, are notable examples. An interesting portion of an early pillar, the capital being 3 feet above the floor level of the present church, is seen at the west end of the church; and other portions of the previous building may also be seen near the ground on the west and south walls. Our historian also records that "the steeple or bell-tower hath been lately built, to wit, about the year 1504; for Sir John Percivall, Merchant Taylor, then deceasing, gave money towards the building thereof." It is doubtless this tower of which we are able to see the lower portion now.

Digitized by Google

The church was built between 1628 and 1630, and was consecrated by Laud, then Bishop of London, on January 16, 1630-1. The ceremony was an elaborate one, in accordance with Laud's determination to assert the continuity of the Church and its independence of the alien hostile claims of both Rome and Geneva. The time was rapidly approaching when the doctrines of the latter school were reaching their period of triumph, and when Laud was put to trial under the military despotism of the Puritans, it was one of the charges against him that he had consecrated this church on the old lines. Like most of the later Gothic City churches, St. Katherine Cree has no structural chancel, and its general plan is similar to that of others built in the previous century. But here the resemblance ceases, and all the details are debased Italian, or Jacobean as it is called here. The arches are semicircular and the capitals are of the Corinthian order; the large circular east window may have been inserted with an intentional reference to the Catherine wheel, the symbol of the patron saint of the church. There is much beautiful woodwork in the church, a peculiar feature of London churches, and the organ was made by Father Smith. The glass case on the east wall contains a Prayer-book given for the use of the churchwardens by Martin Bond in 1630, and a Bible given by S. Cornick in 1693. The first stone of the church was laid by this Martin Bond, who was



ST. ANDREW UNDERSHAFT.

captain of the City train bands, and who is represented as seated outside his tent and surrounded by his fellow citizen soldiers in his monument at Great St. Helen's Church. The monument to Sir Nicholas Throckmorton, who died in 1570, was in the old church. He was Chief Butler of England, one of the chamberlains of the Exchequer and ambassador to France, and married the daughter of Sir Nicholas Carew, whose monument may be seen in the church of St. Botolph, Aldgate. Richard Spencer, Turkey merchant, 1667, is commemorated by a monument in this church.

The following description of its internal architectural features from the pen of the late Mr. G. H. Birch, F.S.A., will be of interest:—"The piers or columns are not moulded, but are columns of the composite order, carrying semicircular arches, the soffites of which are coffered, with a circular flower in the centre of each coffer; the arches have well-moulded architraves, and above them runs a cornice, the lower mouldings of which mitre with the architraves. Above the cornice is a lofty and well-proportioned clerestory, the windows of which, and also those of the aisles, are peculiar; they are of three lights with cinque-foiled heads; the centre light in each case is higher, and a square-headed moulding breaks round them; the cills are splayed, and between each is a square pilaster with a boldly moulded cap and base springing from corbels of which not two are alike, and these corbels partly occupy the spandrels between the arches. From the caps of these pilasters spring the vaulting ribs; the vault itself is very flat in section, and in the centre of each compartment is a large boss or centre flower with the arms of one of the City companies, Goldsmiths, Fishmongers, Merchant Taylors, &c., in high relief, coloured and gilt. The vaulting of the aisles is quadripartite, with moulded wall, diagonal and ridge ribs. Springing from corbels only the vaulting of the two bays forming the chancel is much richer." The east window is wheel-shaped, the circle being enclosed in a square; it contains glass, some of which probably dates from 1628; other portions are the gift of Sir Samuel Stainer in the early eighteenth century—the giver was Lord Mayor in the first year of George I. A sundial on the external south wall of the church, dated 1706, has the motto "Non sine lumine."

There was a church, built in 1621, rebuilt in 1727 and demolished in 1874, known as St. James, Duke's Place, erected upon a portion of the site of the priory of Holy Trinity, the position being that of the chapter-house. An illustration of the south gateway of Duke's Place, in 1793, may be seen in *Home Counties Magazine*, vol. ii. There are two arches, the larger, very obtuse, for vehicles; and a smaller and more acute-angled arch through which foot passengers

MONUMENT OF JOHN STOW.

might pass. The dripstone of the latter is ornamented, and both have terminal bosses. The picture, together with two plans of the priory of Holy Trinity, Aldgate, illustrate a most interesting article by Mr. W. R. Lethaby. The original plans are in the possession of the Marquis of Salisbury at Hatfield, and were from surveys made by J. Symans about the year 1592, just before the dissolution of the priory. They show the enormous space covered by the buildings of the monastery, reaching from Sir Thomas Heneage's garden, on the other side of what is now Heneage Lane to the Aldgate, and bounded on either side by "London Wawle" and Aldgate Street, now merged in Leadenhall Street. The portion of London Wall which ran along Houndsditch is represented with bastions, probably such as the one at present existing in Cripplegate Churchyard. There was another in Camomile Street, during the demolition of which some exceptionally good Roman remains were found. These are now in the Guildhall Museum. Chaucer lived in the Aldgate at one period of his life, which doubtless was an interesting thing to John Stow, who edited his works in 1561. Another editor of Chaucer's poems was William Thynne, clerk of the kitchen to Henry VIII., whose acquaintance we made at Allhallows, Barking.

THE DIFFERENCE IN ARCHITECTURAL STYLES.*

(Concluded from last week.)

WHILE we all know that the sixteenth century was the period of the momentous revolution, "whose chief characteristic was the transfer of the allegiance of progressive nations from clerical authority to civil," the Renaissance of the fifteenth century was all-pervading in literature and in the other arts as well as in architecture, and its first and strongest impulse was apparently the reaction from unguided liberty and license to the classic spirit of law and order, and the widespread desire, in the midst of the chaotic confusion and eager movement of the times, for a return to some form of artistic standards.

While Greece was too distant and her ruins too utterly broken or buried at that day, the great Roman remains were near enough and well preserved enough to become the Mecca for study and inspiration, and after the famous expeditions of the French into Italy at the latter end of the fifteenth century the Court returned deeply imbued with the new spirit; and henceforth the Classic art of Greece, as seen through the interpretation of Rome, and handled by the clever, artistic and intelligent skill of the Frenchman and the Italian, has been the guiding influence from the early days of the Renaissance to our own times. The spirit, not the mere letter, of Classic architecture was enthusiastically studied, and a careful, intelligent, artistic application made of it to new conditions, new climates, new customs, new resources, and still influenced by the existing practices and traditions of different localities. What modern Europe saw in the old Roman temple and amphitheatre and basilica and bath and triumphal arch it applied to the churches and villas and palaces and museums of its own day—Italy, France, Germany, and finally England, each with their own individual characteristics.

It has been said that, up to the time of the Renaissance, architecture, Greek, Roman or Gothic, was real and pure in its own style, in its direct purpose and method of construction, with the exception of the sham decoration of the Roman, and that of the Renaissance, like it, was not a system of architecture, but a scheme of decoration. True, perhaps, but so intelligently applied that we must admit it to be a much truer art than the Roman—a very fine art indeed. Its development was rapid, and at the end of two centuries it had reached its high-water mark, and again the tide turned. As in the case of the Gothic, its weakness and decadence came from the development into excess, without fixed motive and connection, of its own best inherent qualities as mere whim and excuse for meaningless ornamentation. On the one hand, the grandiose, monumental, artificial style of Louis XIV., the sham, imposing façades concealing interiors with which they had little connection; and on the other, the so-called Baroque or Jesuit, most conspicuously exemplified in Spanish work, of excessive, meaningless, vulgar ornamentation, losing sense of form and order.

In Italy the old Roman feeling never had lost its hold. The Gothic there had only a temporary, half-hearted sojourn in superficial forms rather than spirit, and Classic lines show themselves through the Mediæval work till the latter yields the ground entirely to the full advancing wave of the Renaissance. France, however, did not blindly yield to the new force, but rather captured it and became its master. So we find all through her borders the new Classic revival greatly modified by the still prevailing Mediæval spirit, and most intelligently and successfully applied, so that the great châteaux of that period are among the best specimens of good architecture the world knows, and models for study and inspiration for our own times.

While we may not here, in limited time, dwell on them, one must not overlook entirely those side issues, as it were, the more special styles of a narrow scope—the Moorish, the Indian and those of other Oriental nations—the results rather of more purely local, though very strong, influences. These are the double links, or pendants, in the long chain, from which no continuous direct line has proceeded, having no element in the features of their peculiar style that found natural growth elsewhere; their reproductions in other localities are only artificial and conscious imitations and transplantings, not genuine outputs of the soil. On these well-known styles, however, which we term the "Byzantine" and the "Romanesque," the remarkable results of a combination of Greek and Mediæval spirit, whose influence has been widespread, one might dwell with great interest, as they produced two of probably the greatest buildings of the modern world—the Sta Sophia of Constantinople and the St. Mark's of Venice.

In this gradual transition from style to style two interesting elements may be noted: one we may call that of "reminiscence," the other of "anticipation"; that is, the essential and structural features of a given style have a tendency to appear as the incidental or ornamental features of the style just preceding or succeeding it, superimposed upon different forms of construction. This, notably in that rather vague period of several centuries which we term the "Romanesque," which followed the Dark Ages and led on to the great Mediæval or Gothic period, when, even with the perfected structure of arch and buttress, the influence of classic Rome is still long felt in the forms of moulding and ornament, as a reminiscence; and, during the same period, broadly speaking, in the Byzantine work of the Orient, while the Roman structural methods of arch and vault still prevailed, the prominent features of the coming Gothic are creeping in as a mere matter of decorative form. And again, centuries later, the same phenomenon reappears (as we will see later) when the Renaissance placed upon its buildings, still Gothic in structural method, its modified Roman details, in anticipation of the return to Classic forms. While this is not an element of essential importance in the evolution of the great styles, it is an interesting step in the progress of events, and may be noted in one or two of the world's great buildings of the period.

All this is what has been happening up to our own times—say, into the eighteenth century. Since then has followed a repetition of the same forms, sometimes a reproduction of the one style or the other, sometimes as genuine constructive work, sometimes as mere sham, sometimes intelligently applied with knowledge and good taste, often showing only bad taste and ignorance, France keeping in the lead, more even as an academic teacher than in executed work, with all that is the best, while among inferior productions of other nationalities it would be invidious to make here any comparisons.

And so we come finally back to the old question, "What are we doing ourselves in America to-day?"

Someone has said that "American architecture consists of trying to make something look like something else that would not be desirable if genuine," and also that, "owing to the general impression that ugliness and prosperity go hand in hand, we must accept the heritage of ugliness as a consequence of commercial success."

If this were ever so, it is so no longer. "Business men now begin to see that a beautiful city means not only a pleasanter life, but better business." It is true that the prevailing spirit of our age is scientific and commercial (not necessarily in a bad sense), and that truths, even religious truths, are sought by scientific investigation rather than otherwise; and with this has come in the last half-century the almost overwhelming rush and complication of modern life and new developments in science, creating in our cities new demands such as the world has never known before. But our materials, stone and wood and bricks and mortar, are about the same; no new inherent qualities are discovered in them, for either construction or expression, which the Greek and the Roman and the Goth have not already found and fully developed and shown to us.

We are flooded, through all sources of information, with the knowledge of all that has been done by all the ages before us. We find "there is nothing new under the sun," and we cannot construct and design unconscious of the precedents and traditions of the centuries, even if we would; for, though men sometimes find it hard to remember, it is still harder to forget. But what we do know is this. We have seen and we know the good from the bad, the true from the false, the real from the sham. We want to do the best we can with the conditions in our own day and generation, and we are very unprejudiced and intelligent and clever in doing this, we Americans, perhaps—with France as our schoolmaster—solving the problems better than the other nations. As the one new factor in the work there is naturally suggested the tall, many-storeyed building of metal frame and construction, covered with a screen of some other material in architectural forms. This, although engineering rather than architecture, is as much a legitimate development of the times as was the Roman. The steel and iron skeleton itself has no suggestion of any architectural forms, and is therefore decently and attractively

* A paper read by Mr. J. B. Noel Wyatt, architect, before the Municipal Art Society of Baltimore, and published in the *Architects and Builders' Journal* (Baltimore).

clothed with such as a frank outer garment, not necessarily without character and beauty, expression of purpose or mode of construction.

These tell the same story in our time first told by the Egyptian pyramid—that the architectural work of all men is but "the unconscious expression of their eras. Men are the instruments not the authors of styles." And if, then, finally comes the question, "What part does the personality of the individual, the architect, actually play in the work of our designing?" it is simply this :—The facts of structure and form and "style" are the alphabet, the grammar, the rhetoric, the "technique" of the subject, capable of use with infinite variety, while still in obedience to the general laws that have become formulated through the long processes we have been hastily reviewing. And, as in literature or music, sculpture or painting, it is assumed that the educated workman is at least familiar with and master of this "technique;" there is a vast deal of difference in the results between the merely "not bad" because simply "correct" and the truly "admirable" because, while successfully filling the practical requirements of its destined purpose, it becomes also, through the ability and talent of its author in using his knowledge with both freedom and restraint, a thing of beauty and of lasting satisfaction.

My aim has been to show that, in the evolution and development of architecture, those changes only are of lasting importance when permanent, essential structural results are attained, having in them something vital, something affecting the very life of what we term a style. We may mark, from a point of view not altogether imaginative, conditions existing in the life of architecture somewhat analogous to those of a race or a nation, or even of an individual. In each, life may go on for a long period, year by year, with little change either in outward surroundings or inward conditions of character, of thought and of feeling, and this, too, in spite, perhaps, of occasional special episodes that may startle and interrupt for the moment, but allow us to drop back again into the old lines. And then there comes something radical from without or from within, perhaps rather suddenly, perhaps so gradually that we hardly note the critical moment, but it has come, it has touched an essential principle, a vital spot; there is a change from which we do not revert; it may be for the better, it may be for the worse. Subsequent things may be stronger and brighter; they may be weaker and darker, but they are different. We may partly recall the past as a reminiscence, but the real, the vital new principle underlies the present. "And life is never the same again." This is true for man himself and it is true for his architecture.

And if we finally ask what, then, is the real meaning of this thing "style" in architecture, I think we can say it is that same thing which we find in man himself, whether it be for good or for evil—it is character.

THE ROKEBY VENUS.

THE following interesting article on the palette used in painting the Rokeby Venus is taken from an article in the *Scotsman* by a correspondent, "A. P. L.":—

The Rokeby Venus shows a considerable alteration in the materials and vehicles used for painting since the days of Giotto and the manuscript of Cenini Cenino, which gives us the most authoritative account of the methods of painting at the beginning of the fifteenth century. Then the universal medium was egg—either the white or the yolk—sometimes mixed with the juice of the fig tree, which contains a little caoutchouc, and the paintings were done on panels of wood upon which strips of old linen had been glued, and the surface laid over with a gesso, prepared partly from whitening and partly from glue. This surface again was very often gilded before the painting was placed upon it. Although egg was the main medium used, the properties of drying oils and varnishes were not unknown, and have been described, for instance, in the manuscripts of the monk Theophilus in the twelfth century, and instructions are given by Cenini Cenino for the varnishing of the tempera picture when finished. If these early pictures were varnished, it is evident from their appearance now that this varnish has long ago perished, leaving exposed the dull tempera painting. The somewhat limited and stiff painting, although extremely good of its kind, which is possible with this medium, is familiar to all of us. We see the work in this medium brought to its highest perfection in the paintings of the early masters.

When Cenini Cenino was writing his treatise on tempera painting Van Eyck was painting his pictures, and to him has been ascribed the honour of the invention of oil-painting. A careful examination, however, of Van Eyck's pictures throws considerable doubt on the accuracy of this statement. There is one well-known picture of his in the National Gallery, with husband and wife standing side by side, and the lady has on a dress of a vivid and beautiful green. Now if we search through the pigments of that time, as described in the manuscripts of the monks, we find only one green mentioned which could have produced this result, and that is verdigris. This is a pigment which rapidly blackens when mixed with oil, but if dissolved in the balsam of a pine, such as Venice turpentine, it forms a beautiful and transparent green, which is quite permanent when acted on by air, moisture or injurious gases. That this secret was known at a later date is shown by the records of De Mayerne—a physician at the court of Charles I.—and it seems much more probable, therefore, that Van Eyck, improving slightly on the methods of the tempera painters, was not satisfied merely to varnish the completed picture with some transparent spirit or oil varnish, but, having done his solid painting in tempera, used glazes or translucent lakes and transparent verdigris, prepared in a varnish probably consisting of pine balsam with a little oil and wax, and so advanced one step further towards the use of a transparent medium throughout the picture. A medium of this kind is somewhat stiff and difficult to work with, but it lends itself quite well to the minute highly-finished work which we associate with Van Eyck.

Once the possibility of using a transparent medium with the pigments was discovered the gradual passing from tempera pictures, protected by varnish, to pictures in which the solid painting was in tempera and the glazings in varnishes, and from that to the use of a drying oil, in which all the pigments were ground, is not a difficult process of evolution. But in gaining the advantages of a new medium which lent itself to new effects and to the free perfection of brushwork artists were introducing new dangers, if we regard their work from the standpoint of durability. It is questionable whether any drying oil is as durable as the albumen of the egg medium, or the pine balsams which were used to protect fugitive pigments. There can be no doubt that oil is permeable to air, moisture and injurious gases, and that consequently its introduction means at once a limit to the palette, and the rejection of many pigments that can be otherwise safely used.

It is impossible, looking at the Rokeby Velasquez, to doubt for a moment that the medium used in painting has been oil. Whether it was linseed oil or nut oil is an open question, though as the oil from walnuts was a favourite medium with Italian painters, it is very likely that Velasquez would make use of this also. Of course, a little varnish may have been introduced into the oil without hindering its facility of working under the brush, but the amount would be small, and while it would no doubt tend to increase the durability of the surface, it would not seriously affect the question of the durability of the pigments that were used. Looking, however, at the Rokeby Venus, there seems to be no reason to suppose that he used any pigments which we do not know from modern experience to be durable, with the possible exception of lake. A lake, it may be mentioned, is a pigment formed by absorbing colouring matter from a solution by a translucent alumina base.

The painting of the flesh does not necessarily involve the use of anything but white lead and the earth colours, while the blue of the ribbon round the Cupid may very well be real ultramarine prepared from the most precious of all the pigments used by the old masters, and forming a pure and absolutely permanent blue. It is, however, also possible that the blue may be cobalt, as Palomino, who wrote in 1715, includes this among the pigments known at the time of Velasquez, although it was certainly not known to the earlier painters. This, however, would be quite as permanent as ultramarine. The white is no doubt white lead; the black may be a black prepared by the charring of bones, or the fine blue-black obtained by the charring of peach stones, or the little shoots of the vine. The deep piece of green which is seen in the drapery just above the waist of the Venus may very possibly be terre verte. This is a natural earth which originally came from Verona. It is found in the ancient Roman wall-paintings, and was largely used by the early artists of Italy. It is still to be found on the palette of the artist, but is no longer to be

Digitized by Google

obtained of as fine quality, and is very often displaced by substitutes and imitations. It is, of course, also possible that the green is produced by a mixture of a blue and a yellow, but there seems no reason why we should assume this.

There only remain for consideration the red drapery behind the figure and the purple-coloured ribbon over the mirror. Here it is evident that a lake has been used, a lake which has probably been glazed over a brilliant red, such as vermilion. If we study the recipes which have been left by the monks, we find several substances mentioned from which lakes can be prepared, and on repeating the recipes we find these lakes to be of somewhat dull and bluish tint, resembling purple lake more nearly than crimson lake. Among these is a dye wood known as verzino—called Bacam by the Arabs—and mentioned in the Book of Roots of Rabbi David Kimchi. The best qualities of this wood, according to Marco Polo, grew in Ceylon, and it was afterwards discovered in and imported from South America. There are similar dye woods imported from the East, all of which yield lakes of the description given. All these dye woods, however, give fugitive lakes. Another substance used for dyeing and also for lake making was kermes, a small insect of the same genus as the cochineal insect, which is found on the prickly oak round the coasts of the Mediterranean. This yields a fairly permanent dye, and can be traced throughout the Middle Ages in the south of Europe. It is mentioned in a commercial agreement between Bologna and Ferrara in 1193, and Florence and Venice were famous for the stuffs dyed with it in the fifteenth century. The Italian name for the dye was "grana," and from that comes the English phrase "to dye in grain," and Shakespeare has given his testimony to the durability of the dye when he makes Olivia say of her complexion, "'Tis in grain, sir; 'twill endure wind and weather."

The late William Morris always used kermes for dyeing his tapestries, but if we prepare a lake from kermes we do not find that it is at all permanent when exposed to the light, although it is more permanent than those obtained from dye woods. Kermes was replaced by cochineal as a dye after the conquest of Mexico by Cortez. It was well known as a dye stuff in 1549, and a recipe exists in a Padua MS.—probably of the middle of the seventeenth century—by which either the one or the other may be used in the preparation of a lake. It seems, therefore, possible that the lake used by Velasquez was either prepared from kermes or from cochineal, and, therefore, that it corresponded to the crimson lake of to-day. The method of obtaining the rich red robes which we see so often in the paintings of the old masters, and of which there is a fine example in the curtain in the corner of the Rokeby Venus, was to paint solid with a bright red, such as vermilion, and then to glaze over it with one of these purple lakes. If we prepare one of these old lakes and paint it over vermilion in this way, and then compare it with some of these deep rich reds of the robes, we find that these robes have evidently faded considerably and become very much browner, and therefore probably more beautiful in tone. It is only after exposure to light outside a window for some months that we can produce a colour which at all matches the deep rich red we are accustomed to. It is probable, therefore, that the red curtain has faded considerably and become richer and browner in tone, the fading of the lake allowing the ground colour to show up more clearly, and the piece of painting in pure lake on the ribbon is probably also faded to a certain extent.

On the whole, however, it must be admitted that the colour of the ribbon over the mirror is in a fine state of preservation, and this seems to show that the lake used was probably more permanent than that obtained from kermes or cochineal.

There is another possibility, and that is that the lake was really a preparation of madder. Madder was known as a dye from very early times, and the process of preparing a lake from it is not very difficult, and in those days did not involve any more knowledge of chemistry than was necessary for the dyers of the time; but recipes for madder lake are conspicuous by their absence in the early manuscripts, and the first recipe of which there seems to be any record is given by Neri in the "Arte Vetraria" in 1612. This, however, makes it possible that madder lake was used by Velasquez. It may be objected that it obviously differs very much from madder lake as we know it to-day, but it is very similar to the madder lakes which would be obtained by alum containing traces of iron, and, consequently, as pure alum was not known then, this objection is not a serious one.

We find, then, on examination of the Velasquez that the palette used in painting it was evidently a simple one, and that from our knowledge to-day of the various pigments, there is only one of doubtful durability which need have been used to paint the picture as we see it, and that is the lake. If this lake was really prepared from madder there is no reason why it should fade, but, if prepared from cochineal, its state of preservation is certainly remarkable, and does not seem to agree with the behaviour of cochineal lakes as used by the later painters. It must be remembered, however, that the glazing of the lake over the brilliant red-like vermilion produces a combined colour effect which, as has been shown by experiments, resists the action of time remarkably well, simply getting richer and browner in tone from the fading of the lake and the glowing through of the vermilion. Vermilion itself, when not exposed to direct sunlight, is an absolutely permanent pigment, and when protected by a lake glazed on the top is still more certain to remain without change. The moral apparently to be drawn by modern artists from the Rokeby Velasquez is that if care is taken to use a palette which is limited, and which does not contain fugitive pigments, there is no reason why a medium such as oil cannot be safely used.

SUSSEX ARCHÆOLOGICAL SOCIETY.

THE annual report of the Sussex Archæological Society says there are at present 706 members, the number elected during last year being thirty-three. The sub-committee appointed to negotiate for the purchase of a site for the new museum and library report that some of the difficulties attendant on the Gun Garden site have been removed by enfranchisement, and that the services of Messrs. Ernest Rüntz & Ford have been acquired as architects. Since the plans and elevations prepared by them are now before the landlords for approval, it is hoped that it will not be long before the committee can begin building. Major H. P. Molineux, Mr. G. W. E. Loder and Mr. H. H. Pownall have kindly consented to act as trustees for the Society in the building lease which the landlords have proposed to grant. The Council regret that, owing to ill-health and his removal from the county, Mr. H. Michell Whitley felt compelled to resign the office of hon. secretary. Mr. W. E. Nicholson has been appointed in his place. Mr. C. G. Turner has also resigned the office of clerk and Mr. W. W. Davey has been appointed to succeed him. During the eight years in which he held the office the Society was much indebted to Mr. Michell Whitley for the management of its affairs, the editing of the "Collections" and the arrangement of meetings, all of which he effected with an industry and tact which contributed to the welfare and progress of the Society.

Mr. W. H. St. John Hope reports in reference to Lewes Priory that, through the kindness of Mr. Kenward, he has been permitted to make excavations in his garden for the purpose of finding any remains of the choir and transept of the priory church. Strong foundations are found to exist in many places, but no definite lines of masonry, and a portion of the tiled floor of the south transept was the only important point disclosed. By the like kindness of Mr. F. G. Courthope, Mr. St. John Hope was allowed to sink a number of holes in his garden, with the result that he was able to find the rubble core of the western end of the priory church, and also of the circular building which enclosed the conduit and lavatory above the so-called "lantern." Mr. St. John Hope further reports that he has elsewhere lighted upon the original letters in Italian of Giovanni Portinari to Cromwell, describing the destruction of the priory church. They seem to throw a rather different light upon the plan of the church from that afforded by what can now be proved to be Richard Moryson's somewhat inaccurate translation.

The Council regret that the delivery of vol. xlviii. of the Society's "Collections" was delayed by the untimely death of the Rev. J. L. Booker, vicar of Elmbridge, while his corrections to the paper on the Culpeppers were being made. His death is a real loss to Sussex archæology. While assistant curate of Ardingly he transcribed and annotated the registers of that parish and of Balcombe, and he formed a large collection of notes on the old families of the county, the result of researches in the Record Office, the British Museum and elsewhere, which he was always

ready to place at the disposal of any member of the Society. The Council wishes to express their sense of the obligations they are under to the Rev. W. Hudson for accepting the onerous post of sole editor and for discharging its duties with such care and ability.

During the year the Roman pavement at Bignor has been repaired, and the tesseræ fixed at the cost and under the supervision of the Society of Antiquaries, of London, and a probably unique wall-painting has been discovered in a house known as the Old Flushing Inn, Rye. The Society has made a grant towards the copying of this wall-painting, which will be reproduced in a forthcoming volume. The Council regret to have to announce the deaths of (among others) the Rev. J. L. Booker, elected in 1902; Lieutenant-Colonel Wisden, elected in 1872; Mr. E. S. Cunliffe, elected in 1886; Miss H. A. Margesson, elected in 1876; the Rev. H. Mitchell, vicar of Bosham, one of the oldest members, who was elected in 1858; Mr. John Warren, LL.B., elected in 1871; and Mr. J. A. Luttmann Johnson, elected in 1877. The number of visitors paying for admission to the castle during the year was 4,551.

EUSTON ROAD.

APPEALS by the Worshipful Company of Skinners (as governors of Tonbridge School), the Metropolitan Railway Company and Mr. W. F. Howard Flanders against the certificate of the superintending architect of metropolitan buildings defining the general line of buildings on the south-east side of Euston Road between Liverpool Street and Duke Street, were heard on Friday by the Tribunal of Appeal. Counsel on behalf of the Skinners' Company and Mr. Flanders said the general line of buildings which had been fixed by the superintending architect prevented any advantageous development of the property, the leases of most of which were just about to fall in. It also prevented any advantage which the public might have acquired by the widening of such an important thoroughfare. The certificate of the superintending architect could not be justified because one-storey and two-storey buildings projected over the line. Unless the County Council could show that these buildings were erected without consent or under conditions, then they must be taken into account. Mr. Campbell Jones, surveyor to the Skinners' Company, said the Skinners' Company had offered to surrender from 25 feet to 30 feet of the gardens in front of the existing houses to widen the road if they could build over the remainder. For the railway company, it was said that if the superintending architect's line was to be upheld, that company's property would be seriously affected, for the proposed line would actually go behind a great deal of such property. Mr. Russell, K.C., for the County Council, said the one-storey houses were erected on condition that they should be in no way altered or raised without the consent of the Metropolitan Board of Works; while, with regard to the two-storey buildings mentioned, the appellants had put no evidence in to show how they came to be erected. Mr. Avory said that if the tribunal excluded the buildings erected on conditions from their consideration, he should ask them to state a case for the High Court. The tribunal decided to define the general line of building only between Chesterfield Street and Mapleton Place, and for this purpose adhered to the line as laid down by the superintending architect.

TRANSVAAL INSTITUTE OF ARCHITECTS.

AT a late ordinary monthly meeting of the Transvaal Institute of Architects, the president, Mr. J. Waterson, occupied the chair. Amongst the members present were Messrs. G. A. H. Dickson (past president), H. Seton Morris, S. H. Veale, G. Granger Fleming, A. E. Till, E. W. Sloper, A. Phipps Coles, A. M. Kennedy, A. Forrest (secretary) and several others.

The Chairman, on behalf of the Institute, welcomed Mr. Dickson, their past president, who had recently returned from a trip to Europe. They had also to congratulate Mr. Dickson on his recent election as a Fellow of the Institute of British Architects.

Applications for membership were submitted from the Council, and Mr. Crawford Stuart, architect, Johannesburg, was elected a member.

Mr. F. Saunders, Assoc.Inst.E.E., read an interesting paper on "Electrical Installations," dealing with the lighting of large and small buildings, such as they had occasion to erect under conditions similar to those met with in Johannesburg and Pretoria, paying particular attention to the precautions which require to be taken against the use of inferior materials and bad workmanship, the requirements of the various municipalities and fire offices, and the reasons which had compelled the insurance companies to insist on their present high standard of work. Other points referred to by Mr. Saunders were the decorative uses of electrical fittings, shop and window lighting, comparison of various fittings and systems of wiring, and the faults generally met with in electric wiring. The paper was illustrated throughout by diagrams and a large collection of appliances and materials, the various lamps referred to being shown in use.

The Chairman, in proposing a vote of thanks to Mr. Saunders, said the Institute was greatly indebted to him for the paper read that evening, in which he had given them the benefit of his experience. At their next meeting members of the Institute would have an opportunity of discussing the various points raised by Mr. Saunders.

In replying to the vote of thanks, Mr. Saunders said he had endeavoured to keep his paper within reasonable limits, and no doubt much that would have been of interest had been omitted. He would have pleasure in being present at their discussion on his paper. He desired to thank the various firms who had kindly given him the use of several of the fittings exhibited, and also to his assistants who had superintended their installation.

Correspondence

Standard for Portland Cement.

SIR,—We should be obliged if you would insert in your next issue the enclosed copy of letter to the secretary of the British Standard Committee; a copy of same has been sent to several makers of Portland cement from other raw materials than chalk and clay, but there are no doubt other firms interested in a revision of the present specification, and also many engineers whom we have been unable to communicate with. By your kindness in inserting these letters those interested will, if they care to apply to us, receive full information as to the proposed meeting.—Yours faithfully, CHAS. NELSON & CO., LTD.

March 13, 1906.

[COPY.]

L. S. Robertson, Esq., secretary to the British Standard Engineering Committee, 28 Victoria Street, Westminster, S.W.

"*British Standard Specification for Portland Cement.*"

Re above dated December 1904.

Sir,—On inquiry in the summer of 1905 we were informed by H. H. Humphreys, Esq. (one of your committee), that the standard as then issued was not in its final form and was open to revision. As time went on we found the standard was still issued and used without modification; at the present time we daily find more and more engineers and architects asking for cement to that standard, consequently we now feel it necessary to ask your committee why only cement makers who manufacture from chalk and clay, and those all practically situated on Thames and Medway, are represented on the committee, while makers of Portland cement from other raw material such as the lower lias formation are neither represented nor have been in any way consulted? There are some half-million tons of cement manufactured yearly in the United Kingdom from other raw material than chalk and clay; 4,000 to 5,000 tons per week are manufactured from the lower lias formation. Portland cement made in the Midlands from lias rock is at least equal in strength and durability to the very best brands of Thames or Medway cement manufactured from chalk and clay. Cement has been made from lias rock for more than sixty years.

Clause No. 1 in your specification. This seems to us to be simply drawn up to cover cement manufactured from chalk and clay which is used for the making of Portland cement on the Thames and Medway, viz. the addition of 2 per cent. of calcium sulphate or water to retard the quick setting. In cement made from the lower lias this is unnecessary, as such cement is of a slow-setting nature, and although it is harder than chalk cement at 30 to 33 hours,

Digitized by Google

it is even slower, and consequently less wasteful at 2 to 4 hours than chalk cements even after gypsum is added.

Clauses 2 to 5 we agree with.

Clause 6, as to the proportion of lime to silica and alumina is reasonable; we can comply with the remainder of the clause, but at the same time we would ask what authority or what proof you have that it is detrimental to cement that magnesia shall not exceed 3 per cent. or sulphuric anhydride 2.5 per cent.? Mr. Bertram Blount, one of your committee, will admit that it is well known that in cement manufactured from the lower lias formation both magnesia and sulphuric anhydride are present in larger quantities than in chalk cements; at the same time he will tell you that he has found that cement made from the lower lias carries a greater tensile strain than cement made from chalk and clay. Also in the American standard specification the magnesia is limited to 4 per cent.

Clauses 7, 8 and 9 we can agree to, but for your information our seven-day tensile strain runs from 600 to 700 lbs.

Clause 10. We manufacture in the ordinary way a slow-setting cement to order; we make a quick-setting cement, but it would come within your strain of 400 lbs.

Clause 11. Le Chatelier test. We are of opinion that this is not a satisfactory or definite test; we assume you call it an "accelerated test," but from experience we find it is not conclusive either from a chemical or mechanical point. In fact, to comply with this test we are of opinion that it is necessary to keep down the tensile strain, which is to produce a weaker and less economical cement, which means less lime to silica and alumina and calcining at a lower temperature, or by a modification of the above and finer grinding. Neither the American nor German standard specifications adopt the Le Chatelier test.

The many different factories that manufacture Portland cement from other material than that common to the Thames and Medway feel very strongly that your committee is not a representative one of manufacturers, users and experts of Portland cement in Great Britain; consequently, we ask on their behalf, Will you appoint an early meeting to consider a revision of the standard specification you have produced, at which some representatives of those manufacturers might attend who think the standard specification can be amended and improved, otherwise we feel that an all-round British standard must be drawn up and circulated based on Portland cement manufactured from the different raw materials, instead of, as you have at present, practically the one process and the one class of cement as made by Associated Portland Cement Manufacturers (1900), Limited?

A meeting is to be held in London in the latter end of this month comprising the principal firms who manufacture Portland cement from other material than chalk and clay, therefore it would be a considerable guide to the decision of the meeting if you would write us a letter expressing most fully your committee's feelings on the representations we have made.—Yours faithfully,

CHAS. NELSON & CO., LTD.

Assumption of the Letters "F.S.A."

SIR,—I have seen the letter appearing in your issue of the 9th inst., which Mr. St. John Hope seems to think is a justification of his previous letter, in which he suggested that I had assumed the letters "F.S.A.," and now that I have pointed out to him that I am a Fellow of the Society of Antiquaries of Scotland, he states that in that case I should use the letters "F.S.A. Scot.," and that the letters "F.S.A." without such addition are "restricted in England to Fellows of the Society of Antiquaries of London." I certainly do not know why the London Society should have this option. However, be that as it may, your correspondent says that it is "by universal custom," and at the same time that "it is restricted in England." Which does he mean? I was not hitherto aware that England constituted the whole universe, and as *The Architect* is circulated in Scotland, Ireland, Wales and the Colonies as well as England, it seems to me that a contributor to that or other such journal, being a Fellow of the Society of Antiquaries of Scotland, has an equal right to sign his work with the letters "F.S.A." as would a Fellow of the Society of Antiquaries of London, and which, by the way, is usual.

I am extremely sorry to have been drawn into this discussion, as it seems to me a great pity for such to arise, as the objects of the societies are identical, viz. the study and advancement of antiquity and architecture; but your correspondent's statements left me no option but to justify myself and the position which I have taken up in the matter, and having, as I trust, done so, it is not my intention to continue this correspondence further.

Thanking you for your courtesy, and apologising for the length of this letter,—I am, yours faithfully,

March 12, 1906. H. STEWARD WATLING.

GENERAL.

The Competition for the Central Library, Hackney, gave occasion for the production of 152 sets of designs. Mr. J. W. Simpson acted as assessor. On his award the first place was obtained by Mr. Henry A. Crouch, 12 Gray's Inn Square, W.C.; the second by Messrs. H. C. Trimnell & W. R. Davison, 4 Adam Street, Adelphi; and the third by Messrs. Crouch & Butler and R. Savage, 39 Newhall Street, Birmingham.

At the Last Council Meeting of the International Society of Sculptors, Painter and Gravers the following were elected as Associates:—S. Nicholson Babb, Paul W. Bartlett, W. L. Bruckman, A. S. Hartrick, Raven Hill, Sir Charles Holroyd, Gaston Latouche, Louis Legrand, Bertram Mackennel, A. D. Peppercorn, R. F. Wells and I. Zuloaga. Mr. Timothy Cole was elected an hon. member of the Society.

The Royal Society of British Artists have elected the following members:—Arthur Ellis, W. E. Riley (architect to the London County Council), Geoffrey Strahan, Frank Swinstead, P. T. Gilchrist and Miss Dorothea Sharp.

Mrs. Arthur Melville, widow of the Scottish artist, has presented to the Victoria and Albert Museum, South Kensington, "The Little Bull Fight," or "Bravo, Toro!" which was shown at the exhibition of the Royal Society of Painters in Water-Colours in 1903.

The Designs prepared by Mr. Horace T. Bonner, of 13 and 14 King Street, Cheapside, have been accepted in competition by the Deptford Borough Council for the proposed coroner's court, mortuary and disinfecting establishment to be erected in Watson Street, New Cross Road.

St. William's College, the building at the east end of York Minster, has been purchased by the Convocation and House of Laymen of the Northern Province. It is much dilapidated, but the building has passed into the hands of Convocation on the express condition that it is to be thoroughly restored. It is intended to convert it into a Church house. St. William's College was founded in 1453 as a college for priests holding chantries in the Metropolitical Church.

The Third Annual Smoking Concert of the T-Square Club will take place in the International Hall, Café Monico, Piccadilly, W., on Tuesday next, the 20th inst., at eight o'clock precisely. The chair will be taken by the president, Sir Aston Webb, and with a good programme a pleasant evening is thereby assured.

The Water Committee of the Sheffield Corporation have accepted the offer of Mr. Edward Holmes, president of the Sheffield Society of Architects and Surveyors, to offer a premium for competition by members of the Society for plans and suggestions for the development of the Rivelin Valley estate.

The Royal Scottish Academy last week agreed that three new Associates—a painter, a sculptor and an architect—should be elected at the statutory meeting to be held for this purpose on the 21st inst. The resolution, however, is subject to confirmation at the next meeting.

Mr. T. Werner Laurie has in preparation vol. iii. of "The Cathedrals of England and Wales," by T. Francis Bumpus, in which the chapters on Lichfield, Gloucester, Rochester, St. Albans and St. David's will form special features. Mr. Laurie has also in the Press Mr. Bumpus's "Cathedrals and Churches of the Rhine and North Germany," and promises us "London Churches, Ancient and Modern," from the same pen.

Dr. T. G. Pinches will deliver two public lectures on "The Assyro-Babylonian Monuments in the British Museum" on the 22nd and 29th inst., in the botanical theatre of University College, London.

The Excursions of the London Geological Field Class, conducted by Professor H. Seeley, F.R.S., will commence this year on April 28. There will be ten. The fee is one guinea, which may be paid to Mr. J. W. Jarvis, St. Mark's College, Chelsea. This will be the twenty-first session.

Mr. A. Hunter Crawford, architect, Edinburgh, read a paper on Monday before the Ordained Surveyors Students' Society dealing with "Domestic Hot-water Supply."

The Architect.

THE WEEK.

WHENEVER an accident occurs in an English theatre the public at once ascribe it to some constructive defect, and consider the architect of the building as responsible for the consequences. But however admirable may be the planning and general arrangement, if overcrowding is allowed there cannot be immunity from danger. There is no denying that in some theatres people are admitted when there are no seats vacant. It might be supposed there was a peculiarity in theatres of being elastic. The London County Council, who have already aided in making theatres more safe, now propose to put a stop to overcrowding. The theatres and music halls committee, after consulting the Lord Chamberlain, have sent a circular to holders of licenses for places of public entertainment asking them to determine the number of persons who can with safety be accommodated in each part of the premises, and to cause these particulars to be registered on the plans in the possession of the Council, and to be exhibited in the premises. The committee think that not only the exit capacity but the general arrangements of each part of the premises should be carefully considered, and in no case should the number to be admitted be allowed to exceed that for which exits are provided. The Lord Chamberlain has expressed the opinion "that the number of persons admitted to any part of a theatre should not exceed the exit accommodation provided for such part of the theatre; that the number of persons so to be admitted be arrived at and determined by the London County Council; that the audience should not be allowed to stand in the gangways between or at the sides of the seats, but if the seating accommodation is not sufficient for the number of persons admitted, they might be allowed to stand at the back of the seating accommodation, but not in such positions as would interfere with the ready access to and egress from the seats." It cannot be said that the proposed arrangement is too severe on owners and lessees of theatres. In a panic the obstructed gangways would become most dangerous. Although fortunately no occasion has lately occurred to test the self-control of a London audience, there is always a risk that people will become excited from trivial causes.

WESTMINSTER is changing its character, and streets which not many years ago were little better than slums are now occupied by professional classes. The power of association is not, however, to be arrested. Messrs. TROLLOPE, for instance, have informed the Westminster City Council that clients of theirs who were contemplating to rent an important block of offices in Tothill Street at about 3,000*l.* per annum eventually gave up the idea of taking the premises owing to the objectionable name of the street, which they considered a most unsuitable address for high-class offices. Messrs. TROLLOPE asked that something might yet be done with a view to effecting a change, as it is important to owners of properties and the ratepayers that tenants should not be sent elsewhere owing to the retention of a depreciatory and misleading name for a street. Some of the inhabitants and property-owners had appealed three years ago to the London County Council that the Broadway and Tothill Street should be treated as part of the Broad Sanctuary. But the petition was rejected. The Westminster Council take the same view. Tothill Fields was no doubt at one time outside the boundaries of the Metropolis, and from an old engraving we see ladies and gentlemen strolling in it as they might now in Hyde Park. STOWE speaks of Lord GRAY OF WILTON having a house in Tothill Street, and that Lord DACRE purchased Stourton House and rebuilt it. He also relates that in 1226 JOHN MANSELL gave a stately dinner to the kings and queens of England and Scotland, but as his house in Tothill Field was not large enough he had to put up tents and pavilions to hold his guests. At the time of the Plague a part of Tothill Fields had to be used as a graveyard. But the indignation of SAMUEL PEPYS proves that such a use of the ground was displeasing to those in power. Clients who are ashamed to possess property in Tothill Fields should ask themselves, "What's in a name?" and derive consolation in high rents.

AMERICANS have an undisputed right to complain when they find surviving relics of antiquity in England are treated without respect or demolished. They possess a share in the past history of the country and in whatever can be said to belong to it. Indeed, we think it would be an advantage if protests from American visitors were more often heard, for too many of the English people believe that everything should be sacrificed to existing needs, or, in other words, to the gaining of profit. Mr. WILLIAM SETH WARENNE, of Wyoming, New Jersey, U.S.A., has this week expressed his dissatisfaction at what is about to be done in Lewes. He claims no doubt to be a descendant of the Counts of WARENNE who once owned the castle of Lewes. Through the efforts of Sussex archæologists the castle has been preserved. But Mr. WARENNE says he "was surprised and indignant to learn that a scheme was in progress for the erection of a huge and dwarfing modern building in the middle of this ancient moat (now called the 'gun field'), which, judging from a plan to be seen in the town, will effectually cover the green moat, and utterly ruin the whole of the unique castle scene, both from an artistic and archæological point of view." To make matters worse the new structure is, he says, to be put up in Cockney Gothic of red brick and painted wood. Having heard also that it is the fate of old castles to be given over as peep-shows and tea-gardens, he fears that Lewes Castle will have to follow the lead, or there yet might be found some other site for the new building. It is no doubt to be regretted that such a protest is necessary, but it would receive greater attention if heard at an earlier time. If the care of our ancient buildings could be transferred to Americans they would probably be more secure than under ordinary proprietors, who are jealous of allowing any interference with their rights.

THERE is a close relation between exchanges and business, and it is satisfactory to find that the Royal Exchange of Manchester is found to be inadequate to accommodate the increased number of members. Already some rooms and offices which were let to tenants have been reclaimed, involving a loss of revenue of 350*l.* a year to the proprietors of the Exchange. But the arrangement can only be considered as a temporary remedy. Over thirty years have elapsed since Messrs. MILLS & MURGATROYD'S building was opened, and the space which at that time was adequate is now insufficient. It is believed by some that the City Council should possess the Exchange as one of the municipal buildings, and that a new structure should be erected on the Infirmary site. At present the directors declare that they are not in a position to recommend any definite scheme. Mr. F. B. ROSS has suggested that property on the other side of Bank Street and extending to St. Anne Street, having an area of 950 yards, could be acquired. It would, however, be necessary to erect a bridge over Bank Street to connect the present Exchange with new buildings. The Chairman says that it is necessary with an exchange to have one floor under one roof, and that a supplementary exchange would be useless. For that reason galleries which are set apart for certain trades have not been approved. The problem is an interesting one, but it is only one of several in Manchester which await solution.

AN ICONOGRAPHIC PROBLEM.

THE absence of late years of the English clergy from archæological meetings has been often remarked. It is also evident to all that students like WILLIS, WHEWELL, PETIT, WEBB, are not easily found either in universities or parsonages. We cannot determine the reason for the change. Their interest related to the revival of Gothic architecture, which was one of those powerful but mysterious movements for which it is difficult to account. The revival undoubtedly gave rise to intellectual exertion. We need not say that the efforts which were made with the approval of the clergy to restore buildings now find less approval. There has been a strong reaction, and it may account for the lack of enthusiasm with which Mediæval buildings are now regarded. There is a desire for more freedom of action, and many excellent clergymen are not disposed to accept the theory that they are in any way to be controlled by the planning of a building. There is also opposition to the belief which was expressed by MACAULAY when he said that theology was not a progressive science, and it may be supposed that rigid, antiquated and symbolic buildings are not fitted for an advanced interpretation of doctrine.

An incident has just arisen in connection with the Liverpool Cathedral which suggests a departure from precedent to a remarkable extent. We desire to say that in treating of it we have no intention of entering into the religious signification of the proposal and of its rejection. We simply wish to look at the circumstance from the archæological, or rather from the iconographical point of view. In other words, we desire to consider the subject as it relates to sculpture. That course is allowable. If, for example, a bishop were to insist that Doric, Ionic, Tuscan, Corinthian or Composite columns should not be used in any church of his diocese because he associated them with Pagan temples and with worship which was strange to Christians, it would be permissible to point out that during hundreds of years the orders were introduced in Christian churches, and that it could not be said that they had a debasing influence on the piety of the congregation. Religious theories and architectural theories have had before now to co-operate. Cistercian Gothic is one instance of an effort by reformers and architects working together to attain a definite end. Sculptors and painters have also endeavoured to unite with clerics in the expression of prevalent ideas, and we suppose as long as the world lasts they all will continue to act with loyalty to Church principles.

It must, however, be granted to artists that they have a right to preserve a spirit of unity with their predecessors and to make the condition that they shall not have to reject æsthetic principles in architecture, or in sculpture or in painting. The earliest Christian paintings, such as we see in the catacombs, were, for example, largely in keeping with the decorations in places where humble people assembled. Indeed, EMERIC DAVID goes so far as to say that the Christian painters "had thrown a parting glance on the *chefs-d'œuvre* of antiquity, and had for the last time been guided by the genius of APELLES." That is to say, even in an age of persecution precedents were respected. The peculiarity of the Liverpool case which we are about to consider is the departure from precedent.

One of the praiseworthy results of the commencement of the Liverpool Cathedral is that some of the citizens have offered munificent gifts by undertaking the responsibility for parts of the building or for some of its needful decorations. Mr. DOUGLASS HORSFALL, in a like spirit of generosity, offered to present a reredos estimated to cost 5,000*l.*, but which probably would exceed that sum. He had a design prepared by Mr. BODLEY, R.A., who is one of the architects of the building, and who is not an artist who would introduce any incongruous feature in a church, and especially in the reredos, which is usually supposed to be the object to which the eyes of visitors are first directed. Following the practice of centuries, in the centre was a representation of the Crucifixion. The offer was supposed to be declined because a representation of the Ascension was not proposed instead. The reason for the rejection by the Bishop of LIVERPOOL is so important that we think it right to print his Lordship's words:—

> The reredos, it must be remembered, will be 50 feet high, and the central figure proportionately large. It was felt that such a reredos would traverse the principle upon which the committee have acted from the beginning—that the cathedral was to be built "by all and for all," and that no ornament was to be introduced likely to give needless offence. And inasmuch as the very heart of Christianity is not a dead but a living Christ, and as such a scene as the Ascension more fully and forcibly expresses this great fact, Mr. Horsfall was invited to allow the Ascension scene to take the central place and the Crucifixion scene to stand among the carved pictures illustrating the life of Our Lord which were to be placed below. This, as we understood, he was unable to do. As in the last resort it rests with the Bishop to decide the character of the ornament to be introduced into a cathedral such as that of Liverpool, I am prepared to accept all responsibility for the action of the committee. The very great regard that I have for Mr. Horsfall increases my deep regret that I cannot consent to the erection in our new cathedral of a reredos likely to wound the feelings of some of our best Churchpeople. If every donor had insisted on his own special mark or that of his own school of thought being stamped on its walls or on its ornaments, the great building on St. James's Mount would never have been begun.

His Lordship's words are weighty, and we take it for granted that they describe circumstances which will have to be recognised in other places. We therefore find that in the diocese of Liverpool, if not elsewhere, there are good people who take offence at a representation of what used to be considered as the fundamental idea of Christianity as a religion. Moreover, the awful mystery is considered to be no more than a special mark of a school of thought, a mere stamp on the walls or other ornament. It is for architects to consider his Lordship's declaration, which will no doubt be endorsed by other bishops of the English Church, for indeed we cannot regard the explanation of the Bishop of LIVERPOOL as only an individual expression of good taste as applied to ecclesiastical art.

It cannot be denied that in the history of art different interpretations have been dominant in respect to Divine beings who have to be represented. As we have suggested, joyousness was not absent from the scenes in the catacombs amidst the remains of martyrs. We also know that CHRIST, Who first was represented as the Good Shepherd, was subsequently depicted as a stern Judge. One of the early Christians, who may have worn near his heart a small plaque of the "Lamb of GOD," would be horrified if he could see the stupendous figure which MICHEL ANGELO introduced in the *Last Judgment* which he painted in the Papal chapel. The representations of the artists probably corresponded with the ideas of the majority of people on the subject. Sometimes, as in the case of SAVONAROLA, reformers endeavoured to have traditions respected by the adoption of types which originated in a more primitive age, but, speaking generally, religious art is an exponent of the faith prevailing at the time the respective works were produced.

Now, whatever was the state of fervour among Christians, they appear at all times to have made the Crucifixion predominant in their churches. There was not always a representation of CHRIST, and realistic representations came later than those in which the victim was suggested by a symbol. Although in the catacombs only a letter, or a letter with a cross-bar, was painted, every accepted worshipper understood the full meaning of the symbol. It might not have been formally written out, but there seems to be little

Digitized by Google

doubt that there was a *disciplina arcani*, by which the Christians became acquainted with meanings which were not perceptible to the Pagans. Whether it was right or wrong for them to prefer a suggestion of suffering rather than a journey heavenwards, it would not be for us to discuss. But the fact remains that the earliest Christians acted in that way. As DIDRON says, the Cross is more than a mere figure of CHRIST: it is in iconography either CHRIST Himself or His symbol. "Ubi crux est, martyr ibi" (Where the Cross is, there is the Martyr) was an early statement. The Cross by itself served Christian believers to recall the tragedy as well as would the latest French or German representation. Evidently the early Christians endeavoured to imitate the Cross by extending their arms in prayer. Every student of iconography knows that although the form was so simple, efforts were made to devise varieties of it, some of which have been repeated in the plans of churches. It is also remarkable that often when CHRIST is represented as a Conqueror He appears as holding the Cross to recall His earthly career. Emperors and kings since the time of CONSTANTINE have introduced the Cross as an important feature of their crowns.

It is a subject for wonder how rarely in Early Christian art representations of the Ascension are to be found. The Evangelists are very brief in what is said about the removal of CHRIST from earth, and the author of the Acts of the Apostles imitated the Gospels. This fact should be remembered by anyone who considers the subjects selected for treatment by Christian artists. The earliest representation of the Ascension which exists is found on the ivory cover of a sacramentarium of the ninth century. It is recorded that a painting of the eleventh century once existed in a Benedictine monastery. But inquiry on the subject has not been rewarded. The artists, we may assume, acted under the direction of the clergy, and preferred the triumph of CHRIST, in which they were enabled to imagine Him as throned in Paradise. The great figure at Chartres shows CHRIST treading beneath Him the lion and the dragon. There is a nearly similar figure at Amiens and another at Rheims. The Greek artists have painted CHRIST as an archbishop or patriarch in order to enhance the subject. As processions were supposed in Roman and later times to be the best way of celebrating victories, some artists also adopted such incidents to suggest the SAVIOUR'S glory as a Conqueror.

As we have said, there have been variations in religious opinion which have affected artists. We are only stating an historical truth when we say that hitherto the number of representations of the Crucifixion are far more numerous than those of the Ascension. Works for churches having the former subject have been continuously produced. Whether it is wise in the twentieth century to set aside the established custom is a question which artists cannot answer. Hermeneutics is now in a different position from what it held in the Middle Ages, and the degree of importance which is to be attached to scriptural events must therefore vary. But it would be well to remember that the Ascension is a more difficult subject to treat, especially in stone, than the Crucifixion. "He was taken up, and a cloud received Him out of their sight," or "After the LORD had spoken unto them He was received up into Heaven," are words which it is difficult to render in form or colour. In the reredos of St. George's Chapel, Windsor, Sir GILBERT SCOTT adopted the Ascension as a central panel. But the marble clouds and marble rays of the *vesica piscis* appear bizarre if compared with the trees and curtains in the side panels which represent other manifestations of Our LORD. That work, although excellently carried out by the late BIRNIE PHILIP, is evidence of the great difficulty which attends all efforts of the sculptor to suggest CHRIST unless as the crucified victim. The reason has been given in a passage by T. DE QUINCEY which is little known, but which is worth the attention of all who would attempt innovations in sculpture for churches:—

> The characteristic aim of painting is reality and life; of sculpture, ideality and duration. Painting is sensuous and concrete; sculpture, abstract and imaginative. The *existere* and the *esse* of the metaphysicians express the two modes of being which they severally embody. Hence perhaps it is that Jesus Christ has been perpetually painted and but rarely sculptured; for in this mysterious incarnation, this entrance of Deity within the shade of time and passion, we must recollect that the Divine is the true nature of Christ and the human His superinduced nature; consequently it is to His human nature, as in this case the preternatural, that our attention is called. Life, therefore, or being in time—which is here the uppermost idea—fits the conception of a Christ to painting. But if the case had been reversed, and a nature originally human were supposed to have projected itself into eternity and in some unspeakable way to have united itself with the Deity, the Divine nature would in this synthesis of two natures have been the preternatural or superinduced and the human nature the ground. Such a conception would be adapted to sculpture.

THOMAS UWINS, R.A., once made a picture of the interior of the workshop of an ecclesiastical sculptor in Naples. The discussion over the figures by the artists who were present would not perhaps be edifying to pious people. But it is difficult to talk about works in stone without appearing to be of the earth alone. It cannot, however, be denied that a sculptor although able is never certain that he is representing a withdrawal from the earth to the clouds with any approach to accuracy. He has never witnessed a scene of the kind, and all he can do is to reason out the possibilities by analogy. Martyrdom, on the contrary, was long practised, and indeed there are legends that men were crucified for the benefit of artists. The desire to work with truth may have had something to do with the preference of a Crucifixion over an Ascension, and it may still be advantageous to continue to be respectful to accuracy in adorning our churches. The divine may soar beyond the earth, but the sculptor resembles his material, and is subject to the influence of gravitation.

THE ARCHITECTURAL ASSOCIATION SKETCH BOOK.*

ALL who take an interest in the Architectural Association should be gratified when they look at the new volume of "The Sketch Book." It is entirely the work of young members, and it therefore testifies that at present there exists no sign of decay. The Association has been altered in many ways, but the plates of the ninth volume show that there is no falling off in architectural drawing, and that buildings are measured in all their details with as much zeal as in the past. The volume has additional interest beyond that of any ordinary collection of architectural subjects, for it is an augury of excellent work in the future. It is also evidence that as yet no desire to break away from the past has revealed itself, or of belief with the young architects of some continental countries that freaks are of more importance than any examples which have been bequeathed to us.

The title-page by Mr. E. F. REYNOLDS is suggestive. We have an open arch with Byzantine piers, for that style is now in favour, through which we see various examples of different styles which seem to be connected by roads, and which reach to a Greek temple on a hill as if it were a climax of the art. This forms a creditable introduction to the plates.

There are seventy-two plates in the volume, of which forty-five relate to England, six to Scotland, two to France and nineteen to Italy. The proportions are significant. France, which at one time when Gothic

* *The Architectural Association Sketch Book*. Third series. Volume IX. Edited by Mr. William G. B. Lewis and Mr. Theodore Fyfe. (London: The Architectural Association, 18 Tufton Street, S.W.)

Digitized by Google

was in the ascendancy afforded so many subjects, can no longer compete with Italy. It is also worth noticing that secular buildings, especially residences, occupy most of the plates. In other words, students prefer to measure the class of work which has most relation with modern practice in England.

The first building is Lake House, Wilts, by Mr. F. F. W. GRANT. It is described as "originally part of a monastic establishment, and is about 3 miles south of Amesbury. Its main features are Elizabethan, but an old letter in the possession of a former owner suggests that it might be as early as EDWARD VI., or even earlier. It is built of stone and dressed flints ranged in courses." A plan, elevations, section and mouldings are given. The church of St. Oswald, Ashbourne, is selected by Mr. L. M. GOTCH, and is shown on six plates. It is a well-known example, and PARKER reproduced the brass tablet which records its consecration by HUGH DE PATTISHULL. The plan is very remarkable in its irregularity, and pains have been taken to record the deviations in a way which cannot be doubted. The Kingston Almshouses, Bradford-on-Avon, are shown by Mr. H. A. HALL. The inscription gives the date of their erection as 1700, but at first sight they will be taken as older. Each inmate has a bedroom and a living-room over it. But there could be no degradation in living in so pleasing a building. Very different is the Fellows' Building of King's College, Cambridge, which was measured by Messrs. DENNIS, EDWARDS & DRYSDALE. The architect was JAMES GIBBS, whose design was preferred to HAWKSMOOR'S. Mr. W. S. A. GORDON shows a part of the choir screen in Carlisle Cathedral. It is a Renaissance work, and evidently Italian, without anything suggestive of ecclesiasticism except the monogram I.H.S. The screen was presented by SALKELD, the last Prior. Haddon Hall, in Derbyshire, is a difficult building to survey owing to the irregularity of the plan, which is a consequence of the additions and alterations at various periods. Mr. E. G. WYLIE shows the hall with a completeness which has not hitherto been attempted. The ornament of the interior woodwork is not always of the highest character. But in a mansion with so romantic a history few care to be critical. The fittings are interesting. The Church House, Ledbury, was measured and drawn by Mr. J. H. GIBBONS. It is a fine example of sixteenth-century timberwork, with projecting bays supported by brackets. St. Paul's, Deptford, is an Italian design by THOMAS ARCHER. The church was evidently not intended as a landmark, for it was only about 60 feet in total height. But it is not without dignity, and the interior is well adapted for services. The building which is shown by Mr. T. J. BEE does not deserve the abuse it has received from critics.

The six plates on which Mr. HAROLD HILLYER has represented Somerset House are capital examples of draughtsmanship, which is not, however, served by the introduction of two small photographs, which are indeed little more than blots. Lining, lettering, ornament are all worthy of a practised hand. When the size of the structure is recalled it will be allowed that the task undertaken was no light one. The drawings indicate the work of three architects, for ROBERT SMIRKE and PENNETHORNE made additions to CHAMBERS'S plans. It would have been an advantage if some of the interior could have been shown, for there is much within which is worthy of CHAMBERS. The Archbishop's Stables, Maidstone, which come next, is a freehand drawing by Mr. ARTHUR WELFORD, that is adapted to the style of the work, in which timber is largely used. Mr. J. H. GIBBONS also gives freehand drawings of stalls in Manchester Cathedral, which are examples of elaborate carving. A stained-glass sundial in a window at Marlborough is drawn by Mr. J. C. ROBINSON in a style that is suggestive of sixteenth-century glass painting. The gnomon is missing.

The COLERIDGES have given a literary interest to Ottery St. Mary Church, which has been drawn by Mr. VINCENT HOOPER. It is a fourteenth-century building of a reddish pebbly sandstone, the dressed work being in white. The church was restored by Mr. BUTTERFIELD about 1849, but the lady chapel had been undertaken before by Mr. WOODYEAR. Another peculiar plan is that of St. Giles's Church, Oxford, of which drawings are given by Mr. B. H. COLLCUTT. They are timidly handled, but are careful. The church is a specimen of very early Gothic, and the windows especially have been noted as indicating the progress of the style. The Butter Cross, now the Town Hall, of Peterborough is generally admired as an example of seventeenth-century work well adapted for its uses. Mr. L. WILKINSON has made an effective freehand drawing of it. Shipton Court, Oxfordshire, dates from 1603, and is a good instance of the English mansion of the period. The plate is by Mr. C. W. SMITH. The Manor House, South Wraxall, is shown on five plates by Mr. H. A. HALL, and is well deserving of so much attention. Part of the building was erected in 1426-7, and there were additions in 1598-1600. The fine coved ceiling, which is one of the features of the mansion, is not suggested. The three drawings of the cloisters, by Mr. VINCENT HOOPER, and the entrance to Vicars' Close, by Mr. GIBBONS, show interesting parts of Wells Cathedral.

On one of the Scottish plates are sundials at Braehead House and at Cramond House, by Mr. J. M. SCOTT; the latter is dated 1732, but has the characteristics of an older time. Five plates have been assigned to the church of St. Monance's, in Fifeshire, which was founded in 1362. A description of the church is given, but as it is written in sloping block lettering which has been greatly reduced, it is not legible. There exists a belief that capital letters alone are adapted for announcements that are to be artistic, and if the letters are well formed there is no doubt the uniformity has a decorative value. But unless the lettering can be read it is simply like a wash of colour, as in this case. Mr. A. G. WILSON, who made the drawing, could find a lesson if he compared his description with that on Mr. VINCENT HOOPER'S plates, where the lettering increases the interest of the lines of detail.

France, as we remarked, supplies materials for only two drawings of churches in Normandy. One is of the church at Vatteville, showing a very interesting exterior of late Gothic, drawn in freehand by Mr. WONTNER SMITH, and another at Villequier, which bears some resemblance to the first and is drawn by Mr. A. E. MARTIN. Both are charming examples of village churches.

The Italian examples begin with a drawing by Mr. GIBBONS, of MINO DA FIESOLE'S tabernacle in the church of S. Croce, Florence. It is probably the most perfect example of its class which has been produced. In most cases the tabernacle is a safe, but this one suggests a palace, before which angels bearing flambeaux are waiting. S. Croce also yields another subject, the Pazzi Chapel, which has been drawn by Mr. A. G. MACNAUGHTAN. It was erected from BRUNELLESCHI'S designs, and was adorned by LUCCA DELLA ROBBIA. The columns are Corinthian, and the details possess refinement which would be worthy of any age. Mr. MORLEY has drawn one of the coffers in the Bargello, which is adorned with Florentine lilies, or fleur-de-lys, in gesso, which fill the spaces between ornamental iron bands. The same decoration is used on the lid and the ends. Mr. MACNAUGHTAN, who supplies the greater number of the Italian drawings, devotes two to a doorway in the sacristy of the Certosa, Pavia. There is not a more ornamental building in Italy, and the doorway is in keeping with the greater part. There are portraits of the Dukes, scriptural and allegorical representations, and an abundance of minor ornament. A plan, section and elevation are also given of the church of Santa Maria di Canepanova, which was commenced in 1492 by BRAMANTE. It may be described as a double church with several chapels and altars. The exterior is rather

Digitized by Google

plain. Mr. JAMES MCLACHLAN has prepared two drawings of ceiling decoration from Pistoja. In one heraldry is employed and in the other floral decoration. Pope JULIUS III. took a great interest in England, but he deserves to be remembered for his desire to erect a perfect villa in Rome. He prepared the first plan, but many architects were connected with the building. VASARI declared that he was the designer, though anything he did was said to have been inspired by MICHEL ANGELO. VIGNOLA had also a share in the work. Sculptors and painters likewise united to make the building unique. Under a later Pope it became a veterinary school. Mr. MCLACHLAN occupies eight plates with the representation of it. It does not suggest, however, the advantage of co-operation among different architects. The architectural details are of an ordinary kind, and we suppose a precedent could be found for every one of them. But we should recollect that when it was erected there were somewhat finer views of Rome to be obtained than at the present time, and that the statues and fountains were additional attractions. The drawings of the villa form an effective ending to the volume.

THE LAW OF COMPENSATION.*

BY A BARRISTER.

"COMPENSATION" is a word which conveys to lawyers the satisfaction to be made to owners for the interruption of their rights of property by virtue of statutory authority, and only such compensation, if any, as the statute directing or authorising the thing to be done or the statutes incorporated therewith have provided can be recovered. In the two volumes before us we have an excellent work on this important branch of the law and the procedure thereunder. An Act of Parliament is the only method by which in this country a person can be compulsorily dispossessed of his property, and then only, as a rule, if it is for the public good and upon the terms of paying full compensation.

In this work there are nearly 100 statutes collected together dealing with this subject of compensation, and the labour of collecting, arranging and noting them must have been enormous—in fact, the author tells us that the labour extended over six years.

The system adopted is to give the statute, then to state the principles under the different sections, giving in addition in the form of illustrations the numerous reported cases on those principles (some 2,700 in all), which reported cases are treated with sufficient fulness in quotation to make the work useful. We are pleased to note that the actual date of each case has been inserted, a most useful factor in the value of a judicial decision.

In the present age of encyclopædias and collections or digests of cases and statutes, rather than treatises on a particular branch of the law, this work before us is a good example of such a collection. Not being a treatise, it does not deal with subjects that remain matters of opinion or construction. On such matters the student is not assisted, but for the business man who finds it impossible to devote his time to a minute search of authorities, and who perhaps has not the advantage of the statutes and reports on his shelves, the work will be most useful and trustworthy, and will undoubtedly attain a high place as a guide. To those whose interests are affected and seek compensation under some one or more of the different statutes, we heartily recommend the work. They will find it most useful, if not indispensable.

We do not pretend to have read the volumes through. We have not done so. A work of this kind is for reference. We have, however, tested it on several points, and have found each time that the subject is treated with sufficient fulness to make it useful to the practitioner.

Some cases of compensation have been omitted such, for instance, as the compulsory purchase of tramway undertakings by local authorities. The principles laid down in those cases are well worthy of consideration.

Among recent statutes should be noted one passed on August 4, 1905, entitled "An Act to give compensation for Damage by Fires caused by sparks or cinders from Railway Engines" (5 Edw. VII., c. 11), which places on railway companies the liability of making good damage exceeding 100*l.* to crops by their engines, giving the railway companies certain powers of entry to prevent and extinguish fires, and providing compensation for such entry and any damage done thereby. This Act comes into force on January 1, 1908.

The volumes have an excellent table of contents and list of cases. They are well and carefully prepared.

It is a good plan, and one which we welcome, to have a copy of the index at the end of each volume. A good index is most valuable; to have it in each volume is a great saving of valuable time, preventing the necessity of using both volumes when only one is necessary.

The forms at the end will be found not the least valuable part of the work, and the forms of costs and other general information make the work altogether complete.

There are quite a goodly number of works on this particular subject, but among them this one will, we venture to assert, take a high place. It is well got up, and it is so up to date that we shall be greatly surprised if it does not become quite the standard work on a subject which is getting more and more generally important as new statutes provide continually new cases for the application of the principles of the law of compensation.

* *The Law of Compensation.* With Appendices of Forms, Rules and Orders, &c. By Alfred A. Hudson, of the Inner Temple, barrister-at-law. In two vols. (Published by the Estates Gazette, Ltd., and Sweet & Maxwell.)

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Mr. E. T. Hall, vice-president, in the chair.

The CHAIRMAN said he presided at the meeting because the President still continued to be very unwell, and he had now been confined to bed for three weeks. They hoped the President would be with them at the next meeting.

Mr. ALEXANDER GRAHAM (hon. secretary) announced the decease of Mr. William Gibbs Bartleet, who was for forty-eight years a member of the Institute, having been elected as Associate in 1858 and Fellow in 1869.

Mr. MAURICE B. ADAMS asked why the Institute was not represented on the Strand Further Improvement memorial committee, which met that afternoon at Burlington House.

The CHAIRMAN in reply said the Council of the Institute had decided that it would not be wise to take part in the present movement, as they had very recently made representations to the County Council in favour of an independent scheme.

Leadwork.

Papers on this subject, illustrated by lantern views, were read by Messrs. F. W. Troup and Lawrence Weaver, F.S.A.

Mr. TROUP said that as the architect had frequently to decide what metals should be used on a building, it was imperative he should know the peculiar properties of each, and why lead ought to be used in one case, cast-iron in another and pewter or copper in a third. To bring out the most prominent qualities of lead—viz. its durability at ordinary temperatures, its ductility, its exceptional weight and its low melting-point—the lecturer compared it with other metals in common use, showing its advantages for open-air purposes over copper, tin, zinc, iron, &c. Lead required, however, great care and judgment in its use. As regards the material as now supplied—milled lead and cast sheet—milled lead is a dull and pasty material compared with lead run out in the old way by casting the molten metal on a sand-bed to the actual thickness required for

Digitized by Google

use. Cast sheet can be had in the open market at the present day at a rather higher price than milled sheet of the same weight. For a flat lead roof, often liable to be walked upon, there is not much to be gained from using cast sheet. The surface texture of the cast sheet, however, is worth making some slight sacrifice to obtain, especially if the old-fashioned open roll or flat welt-roll can be used. Either of those joints is preferable to the usual modern roll with its wooden core. The wood roll has to be large and therefore clumsy, else leaks arise from capillary attraction between the sheets. The open roll has not this defect, but cannot stand under much foot traffic. When lead is used in a spire or turret it is certainly worth while to use cast sheet. Even with a wooden core in the rolls the cast sheets do not cause suction to such an extent as milled lead. The natural surface of the lead as it is cast is the best to use as the exposed surface in a roof or elsewhere. When there is ornament of any sort to be cast with the sheet, then the under or sand surface must be exposed. This can be as rough as you like for roofs or rain-water heads, and a coarse sand may be then used for the casting bed. But for things which come close to the eye, or which may be handled, a much finer sand should be used. More care is then required in the casting to provide for the escape of the steam formed by the molten metal on the damp sand. For a "repeat" ornament or for casting letters and figures for dates a lead mould can be used. This is easily made and lasts for a long time, but a brass or cast-iron mould is more permanent. For knobs and finials it is possible with a lead or brass mould to fill it with molten lead, and after two or three seconds empty out the interior unsolidified lead, giving a hollow casting without the trouble and expense of making a core, as for a brass or iron casting.

For decorative forms the lecturer counselled restraint, lead was so easy to twist and turn. The designer should never forget his material while designing on paper; even in modelling the final material must never be lost sight of. It is quite possible to make a casting from a single pattern in several different materials, but to take full advantage of the best that can be got out of each material that original pattern ought to be varied in each case. For a plaster cast, for example, moderately high relief may be had; but it should be soft in contour, and there is no special reason for economy in material. In lead, however, there is reason for economy of material, and one can have finer lines, and can reckon on bending, soldering, or even to some extent bossing up the casting after it is made. There are several other ways of ornamenting lead. It is very easy to make fretwork patterns for ventilating panes in windows, or as a vallance round a leaded dormer or door-hood. This is best done with chisels and gouges on a block of lead. Lead can also be incised, and the incised lines filled with various coloured mastics in letters or other shapes. One of the most gorgeous possibilities for decoration in lead is to be had by tinning the metal in some design of ornamental or figure decoration, and then glazing over the tin surface with transparent colours.

In the Middle Ages the chief method of working lead and using it in buildings was simply to take the plain cast sheet, and after cutting it to the outline as near as might be, and in convenient size for handling, to dress, boss and beat it up to the shape required. Sometimes these forms were carried on wooden cores; at other times on a framework of iron, or were simply fixed by iron hooks and brackets on the timber framing. This art is as dead as Queen Anne. It is a personal art like sculpture—very often it was sculpture—and no amount of designing by another for the craftsman to execute will do much to restore it. The art has been so long divorced from the craftsmanship, and the teaching of tradition so long deserted, that their reunion is hardly a matter to be accomplished in a single generation. We can but live in hope.

Mr. LAWRENCE WEAVER took for his subject the earlier lead spires. Lead, he said, had no nobler use than in the covering of spires, for spires were the greatest concession that Gothic architecture had made to constructed beauty and symbolism. The lead spire has a character all its own, and maintains its character of a spiritualised roof more intelligibly than a stone spire can do. The white, almost glistening patina which comes with age on lead, where the air is not befouled with smoke, makes the spire stand like a frosted spear against the sky, and the slight twists, which almost every timber spire has taken, give a peculiar sense of life. Dealing with the history of lead spires, and discussing the question of origins, the lecturer quoted the classification of spires given by Mr. Francis Bond in his "Gothic Architecture," and gave his reasons for offering the following classification, based on Mr. Bond's, but corrected:—

Pathless Spires.

1. Collar-type, *e.g.* Ryton.
2. Broach-type, *e.g.* Braunton, Barnstaple, Godalming, Ickleton, Swymbridge, Almondsbury.
3. Pinnacled type, *e.g.* Long Sutton, St. Nicholas and Aberdeen.

Parapeted Spires.

1. Collar-type, *e.g.* St. John's, Perth, the tower of which has a heavy over-sailing parapet, within which the spire stands.
2. Broach-type, *e.g.* Hemel Hempstead.
3. Straight-sided type, *e.g.* Harrow, Chesterfield, Minster, Great Baddow, Much Wenlock, Wickham Market.
4. Spirelets, *e.g.* East Harling, Wendens Ambo, Swaffham, Hitchin, Sawbridgeworth, and Ash, Kent.

A certain difficulty arises in the definition of lead spires owing to the somewhat loose use of the word "broach." What the lecturer called the "collar-type" is sometimes called "broach," but incorrectly. The essence of the broach he took to be that the filling-in between the angles of the tower and the diagonal faces of the spire shall be of pyramidal form. The influence of the stone broach on the form of the lead broach may be admitted without suggesting that the lead broach was a slavish or unintelligent copy of the stone broach. It was a question of carpentry. The construction of the collar-type is more congenial to wood than is the broach. The octagonal framing calls (but not very urgently) for strutting at the base. In the broach the main framing is strutted by single timbers running through the diagonal faces of the octagon; and this is not so satisfactory as the double strutting of the cardinal faces, which obtains in the collar-type. From the weathering point of view the lecturer considered the stone broach to be as efficient as the collar-type, and he felt strongly that the broach was far the more attractive. Having given details and brought out the chief characteristics of examples of the different types classified, the lecturer made some remarks by way of constructive criticism. His illustrations, he said, had shown how beautiful lead spires can be and are. The lead gave the architect no trouble; he gained infinite variety of surface by different arrangements of the rolls; he outlined great cartoons on the faces of his spires (as at Châlons-sur-Marne) and blazoned them with gold and colours; he wanted the metal-cased architecture of the poets, and he got it. His difficulty was that he could not keep it. The timber framing was always liable to destruction by fire. To-day, however, there is an alternative. Our spires can be built in steel and sheathed in lead, and will defy the flames. Here is one field where steelwork may come into its own, may come faithfully and gracefully, may be the metal bones of a metal architecture. The lecturer claimed for it that it preserved the initial idea of a spire that it is a glorified roof; that the lead surface gives opportunities for colour treatment that a stone spire cannot give. Had the Mediæval architect found the material to his hand, we should be pointing to-day to his leaded steel spires as notable examples of the Gothic spirit. In conclusion, the lecturer showed a design for a leaded steel tower done by Sir Charles Nicholson to illustrate his suggestion. The design, he said, was instinct with the poetry and mystery which are the characteristics of great architecture. He could only hope that some ecclesiastical Mæcenas would be found for whom Sir Charles could materialise this dream church encrowned with lead.

Lieutenant-Colonel L. PRENDERGAST proposed a vote of thanks to the readers of both papers, and remarked that few people had a knowledge of leadwork in its artistic sense. Yet there were great architectural works throughout Europe which owed much of their æsthetic value to the surrounding of leadwork.

Mr. H. V. LANCHESTER seconded the motion, and asked what was the most suitable method of putting lead on a construction built of a material other than wood. They all liked lead, particularly for the fine junction it made with Portland stone and the harmony of colour produced when so employed. Could they get a thoroughly fireproof construction and apply lead to it satisfactorily? It seemed to him that this was possible, and if Mr. Troup had had experience they would like to hear the result of his observations.

Sir CHARLES NICHOLSON said he would like to know what timber was used in the Chesterfield spire. He had always understood the twisting was caused by the use of green wood, probably elm.

Digitized by Google

Mr. C. HARRISON TOWNSEND, in cordially supporting the vote of thanks, said reference had been made in the papers to one whose name was well known to all, and who had done much to revive the interest in the craft and working of lead—and he referred to Professor Lethaby. There was, however, an earlier worker in the field, Mr. Eden Nesfield, who was keenly interested in the revival of leadwork and who introduced it in a more or less elaborate way at a time when it was commonly used in plumbers' work.

Mr. MAURICE B. ADAMS suggested that uralite would be a good material to employ when lead and ironwork were used together in construction.

Mr. E. W. HUDSON and the Chairman joined in the discussion, and the two lecturers having replied the meeting terminated.

GLOUCESTER CATHEDRAL.

AT the meeting which was held in Gloucester to arrange for raising funds to carry out repairs to the cathedral, Mr. F. W. Waller, the architect having charge of the fabric, described the work required to be done, in accordance with his estimate which accompanied the Lord Lieutenant's circular. Referring in the first place to the question of the three pinnacles mentioned—one of which had been repaired, and the other two required to be taken in hand without delay—he explained, says the *Gloucester Journal*, that the one which was now temporarily protected had been so covered over because they were obliged to remove a great portion of it before the winter began, lest it should fall during the rough weather. As would be readily understood, scaffolding erected at that height could not remain over the winter, because the wind pressure upon it would be such as to cause it to be blown in all directions. Therefore they were obliged to remove that portion of the pinnacle, and the men had not been able to continue the work during the winter, but directly the weather conditions permitted it would be proceeded with again. With regard to the north transept pinnacle, that had been a source of apprehension throughout the whole of the season. The Dean had called at his office many times with regard to it, and his oft-repeated question had been, "Will it remain where it is for the winter?" He (Mr. Waller) had replied, "I hope it will, but I cannot answer definitely." Still, it was there now, and he trusted, as the winter was nearly over, that it would remain long enough to enable it to be taken down without any danger to the structure being involved. From what he had said it would be seen that the immediate necessity as regarded attention to those pinnacles was very great; they were actually dangerous. Mr. Waller passed from the question of the pinnacles to that of the tower, which involved even more important considerations. They had known for many years that there had been a slight movement in the tower, but it was so slight as not to occasion any alarm. In fact, it was known as far back as from thirty-five to forty years ago, when the large restorations were carried out and the colouring of the roof of the choir was done; and there was evidence now that the joints of certain portions of the groining were then open and had been filled in. What had now produced an acute stage was that a piece of stonework, 3 feet 6 inches long and 6 or 7 inches in diameter, recently fell from the groining of the choir roof in the immediate neighbourhood of the tower. That piece of stonework was of sufficient size to occasion some alarm, and to show the necessity of taking immediate steps to effect any repairs that might be necessary. With the permission of the Dean and Chapter, he (Mr. Waller) at once had a scaffold erected in the choir, reaching right up to the choir groining; and a very careful examination had been made of that portion of the groining from where the stone fell. It was evident that the settlement there had increased since the pointing-up of some thirty-five years ago. He was not yet in a position to give them any definite opinion as to the cause of that settlement. It might be due to one or two causes. Theories had been advanced to the effect that it might have been the result of the earthquake which occurred some few years ago, and that would seem to be a very reasonable suggestion. It might be remembered that the whole of the pinnacles and the tower were restored under the direction of his late father some years ago; the whole of the work was thoroughly well done, there was no accident throughout, and everything up to the time of the earthquake stood well. They made many examinations of the pinnacles. They were examined immediately after the earthquake, and there was no question whatever that they were to a certain extent shaken; some of the stones were cracked through, but not to such an extent as to cause any apprehension or doubt. Still there was sufficient evidence to show that the tower had been affected by the earthquake, and what might have affected the pinnacles at that height might also have affected the groining lower down. Another point to which he might call attention was that the fracture on the stone which fell the other day was partly old and partly new. The old part of the fracture had dust and dirt upon it, and the new part was quite clean. Since that had happened large photographs had been taken of the settlements which had shown themselves in order that there might be a complete record of what was the position at the present day. After the photographs were taken he (Mr. Waller), with the permission of the Dean and Chapter, had had all the settlements which were visible filled up with plaster of a friable kind, the whole thing had been watched with the greatest care, and up to the present time not the smallest indication of further movement had appeared. He had had them examined within half an hour of the commencement of that meeting, and he was able to state that there was not the slightest indication so far that the building had moved since the piece of stonework fell. Further, with the permission of the Dean and Chapter, on the previous Sunday he caused a full peal to be rung on the cathedral bells for the purpose of testing whether the sway consequent upon the ringing of the bells was sufficient to influence the tower to the extent of producing any cracking in the plaster which he had had inserted in the settlements, and he was glad to be able to report that there was not the slightest evidence of anything of the kind. Therefore, as far as he could state at the present time, he thought he might say that the ringing of the bells had no influence of a prejudicial character upon the tower. He went with his son on to the leads of the tower whilst the bells were being rung, and the oscillation was very small, in fact, it was less than he should have anticipated. Proceeding, Mr. Waller said what they were engaged in doing at the present time was to make plans and sections of the tower with a view to ascertaining the exact conditions existing. What he was endeavouring to do was to look at the question rather from a scientific point of view—if he might so term it—than from the wholly architectural standpoint, because he wanted to know the exact conditions existing, what the pressures were around the various points and every possible detail of that kind which would be necessary to enable him to express a definite opinion later on. Referring to the question of the roofs, Mr. Waller pointed out that the greater portion of them were covered with large sheets of lead. The size of a sheet of lead for such a purpose ought not to be more than about 2 feet 6 inches wide by 10 feet in length, but a large number of sheets on the cathedral roofs were twice, and some even three times that size. The result had been that with the constant expansion and contraction of the metal the leads were constantly cracking and moving, and so bad had it been at times that when there had been a high wind parts of the lead sheets would be actually rolled up on the roof, and they were obliged to periodically send men to replace them and put the roofs in order. As a consequence, a quantity of water had in the course of years gradually got in and decayed some of the timbers, and the roofs of the nave, south aisle and north transept were particularly in need of repair. They were in a very bad condition, and that was especially the case with the roof of the south aisle, where, in consequence of the steep incline, the lead had, to use a technical expression, been creeping down constantly and getting into the gutters, leaving the upper portion all exposed. There were a number of other and minor matters, all of which were more or less pressing. The points, however, to which he would more particularly direct attention, as being extremely urgent, were those in reference to the pinnacles, the tower and the roofs to which he had last alluded.

The Committee of the Holborn Borough Council have selected the following six architects to prepare plans in competition for the proposed Council offices:—Messrs. Collcutt & Hamp, Bloomsbury Square, W.; Mr. Edwin T. Hall, Bedford Square; Mr. Henry T. Hare, Hart Street; Mr. A. Brumwell Thomas, Queen Anne's Gate; and Messrs. Septimus Warwick & Herbert A. Hall, South Square, Gray's Inn. Each architect will receive an honorarium of twenty guineas.

NOTES AND COMMENTS.

IT has been announced that Lord LYTTON contemplates turning a part of his Knebworth estate into sites for buildings, and that some are to be utilised for the erection of cottages. This change is remarkable, for, as the BULWERS have long held the lands of Wood Dalling in Norfolk, the LYTTONS, who were originally settled in Cheshire and Derbyshire, about four centuries ago came into possession of Knebworth, which once belonged to the Crown. A fortress was erected on the site of the present mansion in the time of EDWARD III. In the reign of HENRY VII. it was superseded by a mansion in the contemporary style. The Tudor structure has been perpetuated in the existing building with, it must be owned, a great many somewhat fantastic and incongruous additions. The building exercised great influence on the versatile writer and statesman who became the first Lord LYTTON. He was proud of his possession. But it is likely he would not have disapproved of the project which the present representative of the family has conceived. Although he was not always successful in his pictures of humble life, it is recorded of him that he used to visit the cottagers of the village in his youth, and that he had travelled on foot through the greater part of England and Scotland seeking adventures among people who were of a different class from his own. He even went so far as to anticipate BORROW in living with the gipsies. The proposal indicates the tendency of opinion at the present time, for if it is realised other descendants of Norman nobles may also use their estates in a like way.

IT used to be supposed that proprietorship of land extended to the centre of the globe, and the corresponding right was conveyed to leaseholders. Evidently the private Acts passed on behalf of "tube" railways have put an end to so extensive a privilege. A case was heard last week before the High Bailiff of Westminster, in which Mr. COBURN, a solicitor, sought compensation from one of the "tube" companies for interference with the subsoil of his premises in Long Acre. The railway is at a depth of 120 feet below the pavement, and the company had arranged with the freeholder to pay at a nominal rate of 1*l.* per lineal foot. On behalf of the company the claimant's right to the subsoil was denied, and it was stated that the damage was only hypothetical. The engineers to the company said that vibration was no longer possible, as motors were used instead of locomotives. Counsel for the claimant stated that he was not asking for compensation for vibration, but that as the company had taken some of the leaseholder's soil they should pay for it. The jury came to the conclusion that no damage was suffered and judgment was therefore given for the company.

CULROSS, which is about twenty-two miles from Edinburgh, appears to have been selected as a site for a monastery as far back as the sixth century. In 1217 a Cistercian abbey was founded in the town, and there are other remains of religious establishments. Some authorities believe it was the birthplace of St. KENTIGERN, whose name is associated with Glasgow Cathedral. No one would therefore be surprised at the discovery of carved stones near one of the ancient buildings. But one which is described by a correspondent of the *Glasgow Herald* is of a kind that will surprise archæologists. The stone, it is said, "is over 4 feet long, and after the old lime, which is most adhesive, had been washed and brushed off, the exquisitely-carved figure of a chieftain was revealed, clad in double armour. The figure is that of a recumbent naval warrior, carved on a splayed base. The head, which is gone, had reclined on a richly-bound cushion. The shoulders, chest and arms are encased in plate armour, the hinges and nail-heads of which are quite distinct, those at the elbows being richly ornamented. There is also a cape of chain mail covering the shoulders and upper part of the breast. The lower part of the body has a covering of plate mail or plain armour, which is hinged and fastened at the sides. Over the heart is carved the top rigging of a ship with a cross at the head of the mainmast, from which a pennant is flying. Over the right thigh there is a full-rigged ship of Roman build, having the head of a dragon for a figure-head; it also has a cross at its mainmast and flies a pennant, whilst on the left thigh there is what might represent a strip of tartan. It is in the form of twelve raised squares in three rows suspended from a hand. An ornamental belt surrounds the loins, to which the sword is attached. The belt represents an adornment of precious stones. All that remains of the sword is the roped hilt and richly carved guard. Beneath the plate armour with which the body is covered there is a girdle of chain mail protecting the lower part, very richly decorated, and where the limbs have been broken off. The workmanship is almost as perfect as when it left the sculptor's hands." In Culross we might expect the representation of a Viking, but his armour would have been of a different class. Sometimes Mediæval sculptors were unable to treat figures in a broad way, and they endeavoured to compensate for their shortcomings by bestowing unusual attention on the detail of armour or other costume, which is a mechanical work requiring no great ability. The Culross figure may be an instance of that class.

THIS year's competition for the ACHILLE LECLÈRC prize of 1,000 francs, which is open to architects only, has had one result, viz. that henceforth partnership in a design will not be allowed. The subject given was a maritime terminus for a railway. Fifteen designs were submitted. The prize was awarded to M. LENGYEL, who had been a pupil of M. PASCAL. The jury wished to reward another, but it was discovered that two architects had co-operated in its production, and that one of them had already gained the prize; hence the new regulation which will apply to future competitions. Unless the reports are not to be credited, the same kind of aid has often been exemplified, and the Academy of Fine Arts would be wise to have a comprehensive inquiry on the subject. Every year there are so many prizes to be awarded, opportunities are offered to clever men to aid others. In England we do not consider that "crammers" are acting unfairly, and in Paris artists also are not indisposed to give help to others on the understanding that they share the spoil.

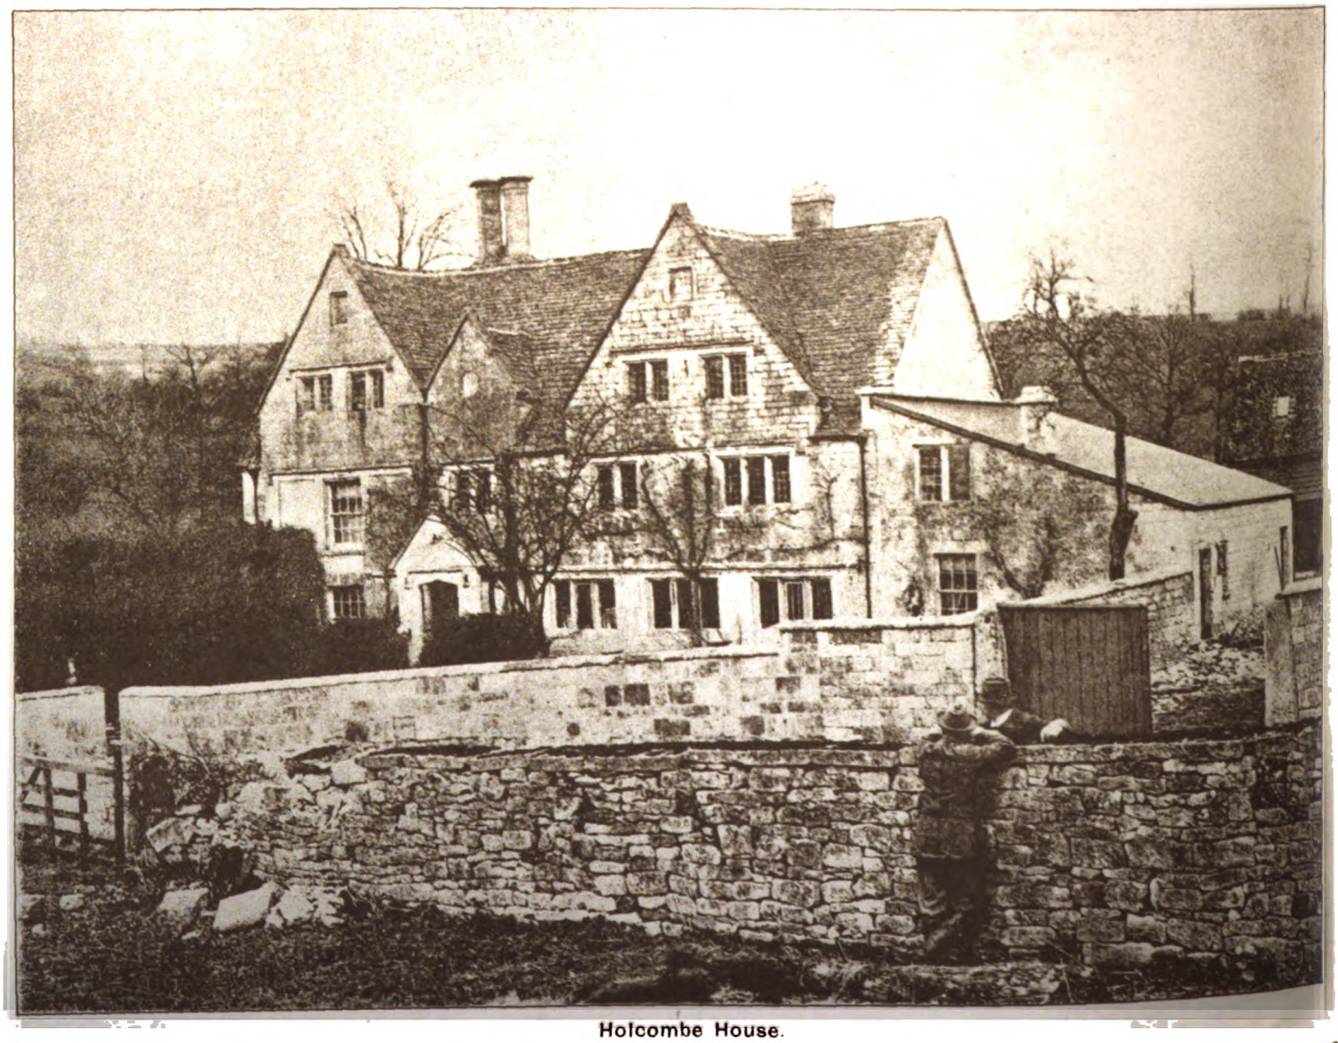
COTSWOLD HOUSES. PAINSWICK.



A PAPER was read by Mr. ELLIS MARSLAND at the meeting of the Society of Architects on the 15th ult. concerning the Cotswold houses, and which was published in *The Architect*. The style of the houses was described as having simplicity for a key-note. This was caused by the fact that only local materials were employed. There was an abundance of stone, and it was used not only for walls but for floors and roof coverings. The wood was oak, chestnut and beech; it was hard, and joinery work was confined to doors and panelling, the glass of the windows being let into the stone mullions. As lead could only be obtained from a distance hips were omitted and the roofs carried through to gable ends, thus becoming a leading feature of the style. Of some of the houses Mr. MARSLAND is the fortunate possessor, and therefore they are likely to be preserved regardless of the changes of architectural fashion.

TOWN HOUSES: OLD AND NEW.*

I IMAGINE that the housing of mankind, whether in hamlets, villages or towns, must always be a subject of great interest to those who have to inhabit them or are responsible for their development, and to none more so than to members of your Institute, who have used up all the adjectives in our language (together with a few of alien birth) in describing them in such varied and attractive wording that owners have been known to refuse to part with their properties after perusing the agent's glowing description of their charms.

But "housing of the working classes" and "garden cities" have been so much to the fore during the past year or two that the charms of a mere town house or mansion are in danger of being forgotten; and it seemed to me, when it was suggested that I should read a short paper before you this evening, that it might interest you to consider some of the old town houses, their merits and defects, as viewed from our present standpoint, and to compare them with modern houses of the same class both as to planning and architectural treatment, and I purpose confining myself to good class houses and mansions of the detached and terrace type in old and modern London. I do not intend to weary you with a lot of dry descriptions of buildings; but after slightly reviewing the development of some of our streets and squares, and a few remarks on the differences between the houses of the seventeenth and eighteenth centuries and those of recent times, to show you a series of views upon the screen, which will, I hope, be of interest, and enable us to examine the subject more vividly than any written description can do.

Before the Great Fire of 1666 the streets in the City of London were for the most part narrow, dark, frequently unpaved and unlighted. The houses were constructed largely of wood and plaster, with storey overhanging storey, and topped with gables in artistic profusion. Many of these old houses were very picturesque, as, for instance, that of Sir Paul Pindar in Bishopsgate Street Without. This house was pulled down to make room for the extension of the Great Eastern Railway, but a portion of the front was preserved, and, as you doubtless are aware, has been erected in South Kensington Museum. It is a fine example of its type, and the house contained good woodwork and ornamental plastered ceilings. Old Fish Street, before it was destroyed by the Great Fire, was typical of the kind I have mentioned, being so narrow and "the garretts so close together that opposite neighbours might shake hands without leaving their homes." But there were exceptions to these narrow and crowded streets, such as Aldersgate Street, about which a writer in 1657 says:—"It resembles an Italian street more than any other in London by reason of its spaciousness and uniformity of buildings." (I wonder how wide it was?) There were in this street a number of fine mansions, including one belonging to the then Marquis of Dorchester, also Thanet House, the latter being one of Inigo Jones's works. It was distinguished by a series of eight Ionic pilasters with festoons of flowers pendant from the volutes, and even as late as 1879 there was a row of old houses, some with projecting upper storeys, on the west side. Inigo Jones had travelled much in Italy, and upon his return built many fine houses in the Palladian style. Some of his work can still be seen in Lincoln's Inn Fields; also Harcourt House, Cavendish Square, and Ashburnham House, Westminster, with its charming staircase, is his work. He is said to have been the first well-known architect to group his rooms, hall and staircase together, but his most important work was, of course, the banqueting-hall, Whitehall, being the only part built of the wonderful palace he designed for James I.

Immediately after the Great Fire Sir Christopher Wren produced a plan for rebuilding the City upon entirely new lines. Like other great schemes, however, it was not, for many reasons (principally financial, no doubt), carried out according to its author's ideas; but the Fire gave rise to new and improved methods of building, bricks taking the place of timber to a great extent. In 1668 Pepys describes a fire in Mincing Lane:—"A detached house not yet quite finished; and the benefit of bricks was well seen, for it burnt all inward and fell down within itself, so no fear of doing more hurt." Improved methods of building did not, however, prevent bad building, for the "jerry" builder existed at that period, as, quoting Pepys again (1668), he writes:—"I hear that there is fallen down a new house, not quite finished, in Lombard Street, and that there have been several so, they making use of bad mortar and bricks."

Apart from the narrow streets and rows of houses there were many large detached town mansions belonging to the nobility, but the terrace of town mansions was not general. In Devonshire Square (1620-70) the whole of the north side was occupied by Devonshire House, the town house of the Earls of Devonshire of that period, and there are records of many interesting detached mansions, such as Newcastle House, Lincoln's Inn Fields; Montague House, Bloomsbury Square; Burlington House, Piccadilly; and it is recorded by Elmes that Sir Christopher Wren built himself a house in Great Russell Street, but in 1823 "its noble front with majestic cantilever cornice was taken down by a speculating builder, and common 'Act of Parliament fronts' run up for four houses in its stead."

Very many of these old mansions were destroyed to make room for the great development of the City in the eighteenth century, when most of the principal residential squares and streets were laid out or rebuilt, with the exception of Belgravia and South Kensington, this being nineteenth-century work. I had occasion in a previous paper to look up the dates of these streets and squares, which, as they may be of interest to you, I will quote here. Commencing eastwards, we note that Devonshire Square was laid out between 1620-70, and was rebuilt later. Finsbury Square was laid out by the younger Dance in 1777 and was the first public place in London lighted by gas. Finsbury Circus was built in 1814. Its glories have departed and huge blocks of offices have taken the place of most of the old terrace houses. Bloomsbury Square was laid out in the seventeenth century, but rebuilt during the eighteenth and nineteenth centuries. Grosvenor Square, although laid out in 1695 by Kent, has been rebuilt to a great extent, and was "the last square lighted by gas." Cavendish Square was commenced in 1717 and 1718, but building was then checked by the bursting of the South Sea Bubble, and this square remained in an unfinished state for many years. James, of Greenwich, was the architect of the two stately houses still in existence on the north side, and which are examples of Wren's school.

The Brothers Adam built the Adelphi in 1768, some houses in Mansfield Street in the same year, Portland Place in 1778, a terrace of houses in Fitzroy Square in 1790-4. These are stone-fronted, and architecturally contrast with advantage when compared with their usual "stucco" treatment. Portman Square was begun in 1764, but was not finished until twenty years afterwards, and was then described as "on the outskirts of the town, approached on one side by a road, unlit, unpaved and inaccessible by carriages."

This brief list of dates gives us a rough outline of the history of the laying-out of some of the principal squares and terraces of houses built during the eighteenth century.

It is a matter for reflection to trace in the evolution of town houses how the trend of fashion has moved westward. And here it may be interesting to note that in most towns the fashionable quarters are in the west, and "fashion" for centuries past in London has ever moved "westward." We are told that "the first emigrations of the London merchants westward (who used to live over their shops and counting-houses) was about the middle of the eighteenth century, and only those who had secured large fortunes and possessed reputations beyond the shadow of doubt ventured as far as Hatton Garden."

We may now consider the work done in the nineteenth century to meet this westward movement, and we soon discover that the speculator was again to the fore.

Regent Street and Regent's Park were laid out by John Nash from about 1812 to 1820. Belgrave Square was built in 1825 from designs by George Basevi, and Eaton Square by Cubitt in 1827—"Cubitt built" being (long afterwards) a sufficient guarantee for well-built houses. This term is used advisedly, as, alas! there is much to be deplored architecturally. From that date to the work done upon the Grosvenor, Cadogan and Queen's Gate estates (dating from about 1880), there is not much to interest us. A very large amount of rebuilding has taken place upon these estates during the past twenty years, and, fortunately, a great deal of it has been done by some of our leading architects, and there can be seen the work which must go down to future generations as some of the best town house work done during the latter part of the nineteenth century. There is considerable variety in the plans and elevations, and the development shows the reaction from the Portland Place and Harley Street type.

* A paper by Mr. Henry White, F.R.I.B.A., read before the Auctioneers' Institute at Hamilton House on Friday, March 9.

Digitized by Google

The "Act of Parliament front" referred to seems to have been responsible for a great deal of the monotony of house fronts of the eighteenth century, and they, of course, still exist in many streets. They were divided into classes, ranking as first, second, third and fourth-rate houses, represented by Harley Street as a first-rate house; Gower Street, second-rate, and third and fourth-rate fronts can be found in various parts.

Now, upon examining the plans of the eighteenth-century town house or mansions in detail, we find that the attention of the architect appears to have been concentrated upon the reception-rooms and halls, the basement and upper floors being left to take care of themselves. Little care was bestowed upon the bedrooms, children's or servants' rooms, which for the most part were low, badly arranged, ill-lighted and unventilated.

Indeed, much of the work which has been found necessary (apart from decorative treatment) to modernise these old houses and to make them "liveable" has been in respect of such basements, upper parts and sanitary requirements, and I think you will be prepared to give the modern architect his due in having in so many cases successfully dealt with the legacy of defects left by his predecessors, who had not to contend with so many authorities, sanitary requirements and the numerous other conditions now considered essential in a good-class house.

So far as comfort goes, the modern town house is much more luxurious than was its prototype. Pope said of Burlington House—

> 'Tis very fine,
> But where d'ye sleep, or where d'ye dine?
> I find by all you have been telling
> That 'tis a house, but not a dwelling.

Of this same house, by the way, Walpole mentions that when the Earl of Burlington was asked why he built his house so far out of town, he replied, because he was determined to have no building beyond him. Think of that gentleman now.

A little study of the plans of the older town houses fills us with surprise as to how people really lived in them, as they contained so few of the amenities which we now deem essential. The basements were mere caverns with labyrinths in the way of corridors; the kitchens often as remote as possible from the dining-room, without lifts or other quick methods of service.

The staff of servants for an ordinary town house of the seventeenth and eighteenth centuries must necessarily have been much more numerous than is now required for the same class house. And where did this retinue sleep? The bedroom accommodation was very limited, and there were no bath-rooms. Now, a good class town house is not complete without a service lift, passenger lift, w.c., bath-room fitted with lavatory basin and towel airers upon each bedroom floor, housemaid's and linen-rooms, hot and cold water services to every floor, with telephones and electric bells to assist in saving labour wherever possible, and more bedrooms than were formerly considered necessary.

These improvements, together with the conditions imposed by various Acts of Parliament, have materially increased the size and costliness of houses, apart from the question of labour and materials; they have also given the architect fresh problems in design.

You will have observed, perhaps, that the town house of the seventeenth and eighteenth centuries rarely consisted of more than three storeys above the pavement level, with an attic storey in the roof frequently not more than 6 feet 6 inches high in the centre of the ceiling, with sloping sides and low windows hardly visible above the parapets, as in Portland Place—Fitzroy Square being an exception. Moreover, the ground floor was seldom raised much above the pavement level. Now we endeavour to raise the level of the ground floor for the purpose of making the basement lighter and more habitable, and we frequently have to get four and sometimes five storeys above the ground floor. These fresh conditions are largely responsible for the difference between the elevations of our modern houses and the old ones we have been considering, as old ideas of proportion have had to be abandoned, and the arrangement of the windows to meet the demand for bays and balconies, together with these features, do much towards setting the character of the street front. No doubt, also, these additional windows, and the desire to vary them in form and arrangement to prevent monotony, is the principal reason for the fussiness of modern designs compared with the quiet, unobtrusive effect of the older type of front.

Again, the ever-increasing value of a site in and around the centre and the West End of London has resulted in a demand for more to be "got out of" sites, and the architect is now called upon to provide on a 20-feet frontage more accommodation than was ever provided formerly upon much larger sites.

In the hands of educated and trained men I believe these fresh conditions have been an incentive to design of a high standard, as evidenced in many instances on the great West-End estates, but unfortunately the bulk of modern work is not done by highly-trained men, and the results are disappointing. I believe, however, that there is a constantly increasing number of capable men, and I hope the building public and great landlords are beginning to appreciate the better class of work, and that they will assist architects by demanding a high standard of design. However, until a better general knowledge of architecture obtains, and some kind of control is exercised by a body of advisers properly appointed, the patchwork appearance of our streets will continue, and we shall have bits of every conceivable style jostling one another in the same thoroughfare. For example, take Oxford Street from Tottenham Court Road to the Marble Arch. Here, with two or three notable exceptions, I am bound to admit that one must be optimistic to hope for much improvement in street architecture whilst the building-owners are satisfied with such a mixed medley of buildings as we now see in this, one of our principal thoroughfares; and I am of opinion that, for the sake of the appearance of our great city, some authority should be exercised to prevent our streets from being disfigured if the owners do not take more trouble and exercise more care in their own interests.

As a contrast I would point out recent developments in St. James's Street, where, whoever is doing the work, the result is much happier. Please let me add that with few exceptions I do not even know the names of the architects of the buildings in either thoroughfare, and I am merely trying to arouse your interest and to ask you to examine for yourselves, so that if you agree with me, I hope that whatever influence you can use will be directed towards beautifying the great city that I am sure we all love and are proud of. It is admitted by all competent authorities that our old architecture was something to be proud of, and it is certain that our old citizens took a much greater interest in the art of architecture than do the present day public, which I consider a great pity.

I do not wish to tire you with a dissertation upon architectural design, but should like to make a few remarks upon what, no doubt, appears to you and to many architects and others to whom the subject appeals, and that is as to the lack of any architectural schemes for the general development and improvement of our streets and estates, with the result that there is a general mixing up of architectural styles, each man considering his own front without reference to his neighbour, the result being "patchwork," a nice piece of work being spoilt by its shoddy neighbours only too frequently. I fear I cannot suggest a solution of this, except that it rests with the public to take more interest in architecture, for I believe that, as in other matters, when the public sees the need for improvement they will take pains and trouble to secure it.

Now, when the architect is frequently asked to produce in the same house rooms in different styles and periods of work, such as a "Jacobean" dining-room, "Turkish" smoking-room, "Louis Seize" drawing-room, and so forth, the result is a medley rather than a dignified composition.

In studying this subject, one cannot help being struck with the wealth of illustrations which are in existence showing the eighteenth-century work, many of which are upon the walls, and will presently be shown to you upon the screen. Why is there such an apathy now amongst the citizens as to the appearance of the London streets? Is there a Pepys or an Evelyn to hand down to future generations their views upon the streets and buildings of our time?

Since the Brothers Adam laid out the Adelphi, Fitzroy Square and Portland Place, and John Nash Regent Street and Regent's Park with its terraces, no general scheme for the architectural treatment of a thoroughfare has been carried out, although an attempt has been made at Knightsbridge, and the London County Council have tried to propound a scheme for the Strand improvement, but which, so far, does not promise to be very successful, owing to the impossible conditions said to be imposed in respect of the leases.

Until the beginning of the nineteenth century architecture had always been consistent in its design, the work

Digitized by Google

gradually merging from one period into that of the next, and never "going back;" so much so that the trained eye can tell the date of the old buildings by their style and details of mouldings and other features. But owing to the change in the methods of work and training of the workmen, the death of the guilds and apprentice systems, and the introduction of so many new methods and materials and the facilities for travel, there was a very bad period of architecture in the early nineteenth century, and it is only in quite recent years that an effort has been made to revive our traditional work, and even now only by the best trained men. It is to be hoped that this return to our traditional national style may have in time some good effect, and free us from much of the meretricious work now to be seen. Down to the period just referred to architecture in England followed traditional lines very closely, and there were schools of trained craftsmen throughout the land, as is evidenced by the wide spread of the work of any given period.

The architect initiated the design, but much of the detail must have been left to the craftsman, as we find the same features and mouldings all over the country, only modified by local usage and materials. Now all this is changed. Tradition amongst the craftsmen has ceased. Indeed, the trained craftsman (as distinct from workman) no longer exists, and much more depends upon the architect than was formerly required of him. He must now be prepared to settle every point of detail of design and construction, and has to make drawings for the simplest piece of finishing if he hopes to get a satisfactory result. But this is not understood by the public, and I fear the architect is too frequently looked upon by the employer as a necessary evil instead of the guiding hand which is responsible for the success, not merely of the design—by which is generally meant the exterior of the building—but of the planning and scheme generally.

The average building-owner thinks mainly of the matter rom a commercial point of view, and there is but little evidence of any large view of citizenship and the city beautiful being to the fore. Until such view is more general it will be only here and there that beautiful buildings will be erected. It is an age of speed and hurried work and hurried schemes, and I am convinced that even from a commercial point of view the result is not satisfactory.

To come back to town houses again, I draw your attention to Park Lane, and I think that a study of these homes of the millionaires shows an extraordinary conglomeration of buildings. There is no stately laying out worthy of such a position, but practically each house is different in style from its neighbour.

As to the planning of town houses. There are many different kinds of plans, or rather ways of planning, a terrace house for a given site; and in developing new property or remodelling old care should be taken to insure the proper treatment for the particular situation, as, if the house is to be built as a speculation, more depends upon the plan than upon the elevation from a commercial point of view. These plans may be divided into types, to be distinguished by the relation of the hall and staircase to the rest of the rooms. Various plans shown upon the walls illustrate my meaning, and each has its advantages and disadvantages. There is no doubt that a good entrance and large hall adds immensely to the attractiveness of the house if sufficient space can be afforded. Such a hall is shown in the Queen's Gate House, designed by Mr. Norman Shaw, and is very charming, becoming an integral part of the reception-rooms, in fact, and not the cheerless apartment it so often is. For houses where much entertaining is done it is of importance that the reception-rooms should be as much as possible *en suite*, so that at receptions the crowd of guests may not have to retrace their steps by the same way as they entered, but pass through the suite of rooms and so avoid the danger of a crush. In the older type of house which we have been considering we find the reception-rooms on two floors generally, consisting of dining-room, morning-room and library on the ground floor, single or double drawing-room and perhaps a boudoir on the first floor, and in the larger houses a bedroom and dressing-room with powdering closet beyond, as in the St. James's Square house, by Adam. Now in addition to these rooms a billiard-room is frequently demanded, thus using up more of the site than formerly.

The question of aspect cannot be considered to any great extent in town houses, but, of course, wherever possible, sunlight should be eagerly sought after, and if the house faces north, the principal reception-rooms should be at the back, facing south. Sunlight has a great influence on the general health and spirits of human beings, and particularly children, so that all possible means of getting same into the house, either by direct rays or from reflecting surfaces, should be adopted. Schoolrooms and nurseries should *never* face north. In making a survey of a house upon which to advise a client the above-named points should be borne in mind and carefully considered.

Heating and Ventilating.—Too little attention is directed (frequently on the score of expense) to the heating of halls and corridors. A system of hot-water coils is a very desirable addition to the hall, staircase and corridors, and makes for comfort by preventing draughts. No form of window has yet been devised that provides the simplest means of inducing natural ventilation of our rooms to equal the double-hung sash window, for by using deep beads on the cill the lower sash can be raised a little and so admit air at the meeting rails, and by lowering the top sash also a little, gives additional means of ventilation; but the principal point to notice in regard to the ventilating of any room is that the window heads be kept up as near the ceiling as possible to prevent stagnation of the air.

I fear, however, that sometimes the design of the elevation calls for some little sacrifice in this respect, *i.e.* the position of the windows as regards ventilation, but not to the extent one finds in many cases where the window cills are 4 feet from the floor, and the heads of the windows 3 or 4 feet from the ceiling, as I believe is the case in a large mansion in Kensington and in a modern block of expensive flats.

One of the drawbacks to many of the Adam type of house is that the rooms frequently lead from one to the other without corridor access.

Many of the above remarks apply particularly to the terrace house. It is, of course, impossible to lay down any hard and fast rules for the planning of detached mansions, but there are a good many illustrations of old and new houses here which I hope will be of interest to you.

Mention has been made of the detached mansions by Inigo Jones and Sir Christopher Wren, and their work, or its natural development, continued down to the latter part of the eighteenth century; the Brothers Adam being the only architects since Wren's time to formulate anything like a distinct school of design. The early part of the nineteenth century gave us John Nash and Decimus Burton with their Regent's Park terraces, Basevi's work in Grosvenor Square, and I do not think there are any other developments worth considering until the comparatively recent ones of the Grosvenor, Cadogan and Queen's Gate estates, of which various examples will be shown to you upon the screen, and you will find amongst them a lot of excellent work by some of the best architects of our time.

I would particularly invite your attention to the corner house in Queen's Gate, by Mr. Norman Shaw, the design of which shows a return to the traditional eighteenth-century work, which is all the more remarkable coming from such an ardent admirer and exponent of the charms of English domestic Gothic work.

In a former paper from which I now quote, I said that "in dealing with recent work it is difficult to differentiate between the characteristics of the plans of various architects, and it would be necessary to devote a special paragraph to the work of each man to bring out these points; but a study of the plans which have been published shows that in later years much has been done to give greater individuality to the plans of even ordinary terrace houses than was formerly the case. A writer has truly said that 'except in the minority of instances, town houses are not built by men who inhabit them, and rarer still is it where ground values and questions of light and air do not entirely overrule the æsthetic influences of architecture itself.' Indeed, most of the best modern work is that which has been done by architects for special clients to meet the latter's particular requirements."

The Late Mr. H. C. Richards, K.C., bequeathed the sum of 5,000*l.* for the purpose of rebuilding St. Paul's Cross in St. Paul's Churchyard. The *City Press* states that the Dean and Chapter have communicated with the executors to the effect that the rebuilding of the cross in the north-east portion of the churchyard would be attended with a great deal of inconvenience and difficulty. Plans are to be submitted to the executors for a smaller monument in the churchyard.

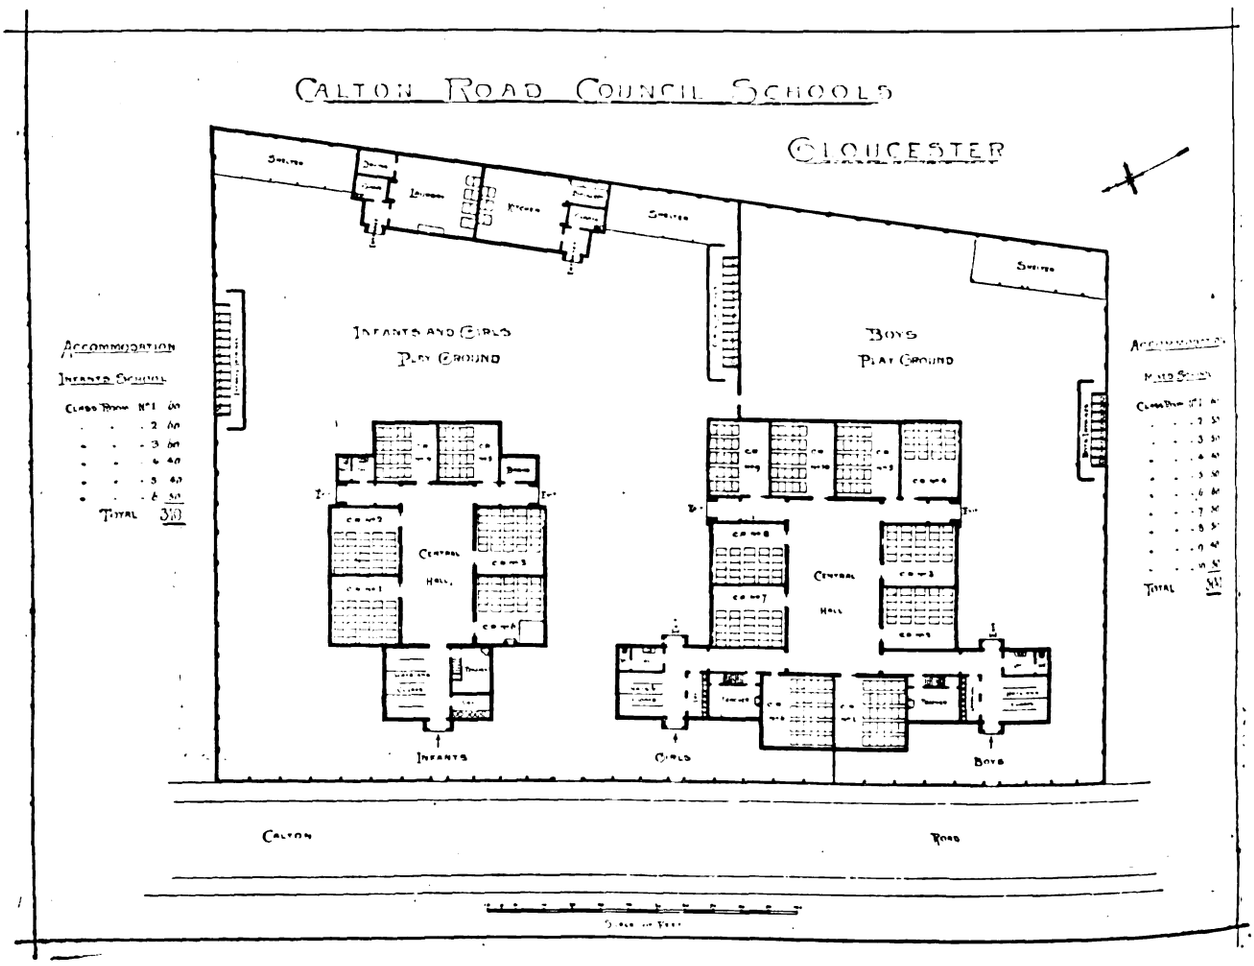
CALTON ROAD SCHOOLS, GLOUCESTER.

THESE schools, which were opened on the 28th ult. by Alderman Hartland, are erected on land situate in Calton Road, the site containing about 7,396 square yards, or about 1½ acre. The buildings consist of three blocks, and comprise mixed school, infants' school and cookery and laundry centre, with separate playgrounds for boys, girls and infants, each department having its own shelter sheds and out-offices. The mixed school provides accommodation for 500 pupils in ten classrooms arranged round a central hall, 61 feet by 32 feet, with separate entrances, cloak-rooms and lavatories for boys and girls and rooms for head and assistant teachers and school store on each side. The infants' school gives place for 310 children in six classrooms, also grouped round a central hall, 56 feet by 25 feet, with cloak-room and lavatories and head and assistant teachers' rooms, stores, &c. The cookery and laundry is provided with distinct accommodation for each department, both containing general schoolroom, cloak-room and lavatory. The relative position of the several schools and the general arrangement of the buildings is shown on the accompanying sketch plan, from which it will be seen that each central hall is provided with ample entrances and exits.

The schools are built of bricks from Mr. Whitfield's yards on Robinswood Hill, with Bath stone dressings, and the roofs are covered with Staffordshire tiles and the general treatment of the exterior is illustrated by the accompanying views.

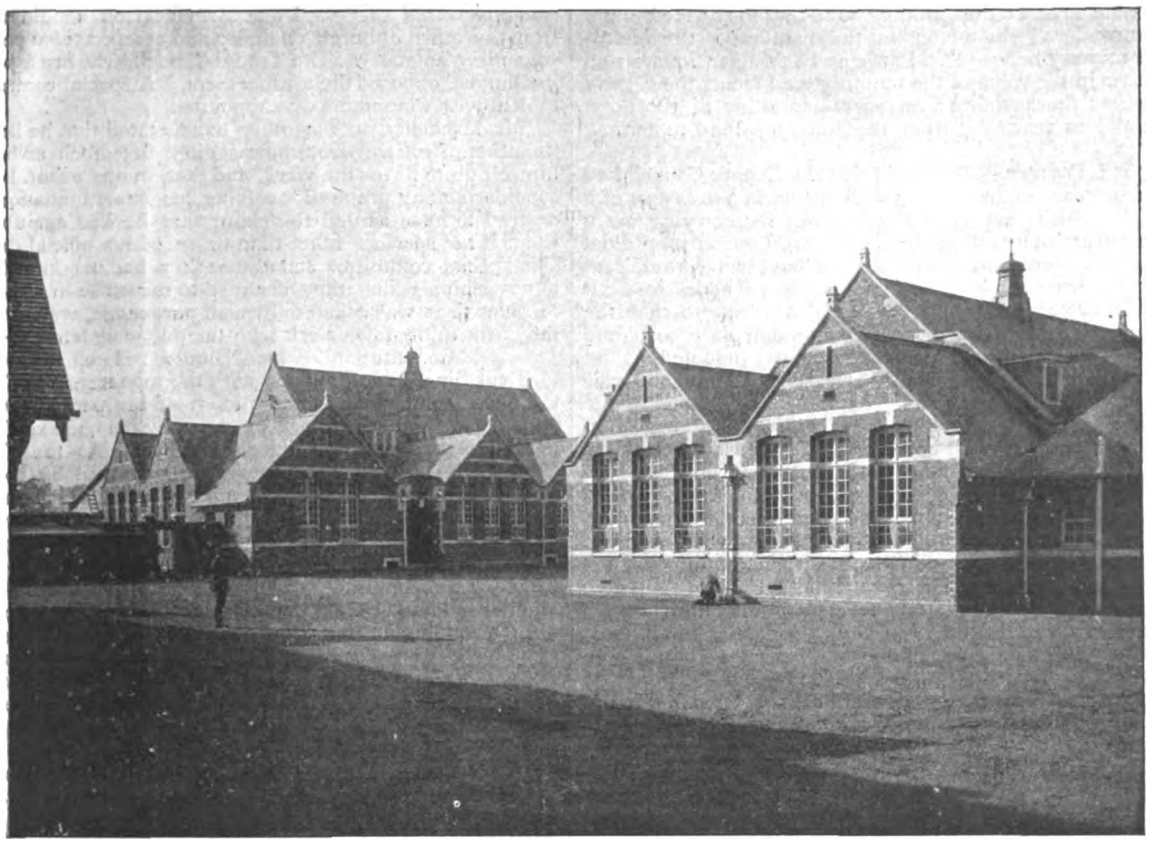
The buildings are warmed throughout by hot water from a central apparatus room placed under the cookery school, and the system of pipes and radiators has been installed by Messrs. Beaven & Sons, Ltd., of Gloucester and London, under the direction of Mr. E. J. Cullis, C.E., of Gloucester. The schools are lighted throughout by electricity, the installation having been put in by Messrs. Woodward & Co., Ltd., of Gloucester. The whole of the classrooms are fitted with oak dual desks, supplied by Mr. James D. Bennet, of Glasgow, and the other furniture throughout the buildings is provided from the architect's designs by the Educational Supply Association, of London, and is executed in orham wood. The fixed blackboards are from the Bennet School Furnishing Company, of Glasgow. The window blinds have been fitted by Mr. C. P. Price, of Gloucester. The whole of the builders' work has been satisfactorily carried out by Messrs. J. Byard & Sons, contractors, of Gloucester, and Mr. W. H. Bush has acted as clerk of works. The foundation-stone was laid by the mayor of Gloucester (Alderman T. Blinkhorn) on October 26, 1904.



In the planning of these schools every effort has been made to produce a building that not only satisfies the requirements of the Board of Education, but which may be found up-to-date in every respect; and while convenience of arrangement for educational purposes has been most carefully studied, soundness of construction with economy has been rigidly adhered to.

The whole of the work has been carried out from the designs and under the immediate superintendence of Mr. Walter B. Wood, A.R.I.B.A., 12 Queen Street, Gloucester.

The entire cost of the building, with furniture and fittings and all attendant expenses, will probably amount to about 14,000*l.*



FURTHER STRAND IMPROVEMENT.

A MEETING was held at the Royal Academy on Monday to consider the memorial to the London County Council in favour of the scheme of the Further Strand improvement committee. Mr. Mark H. Judge, the hon. secretary, referred to the offer of a ground rent of 55,000*l.* a year, which had been made by a syndicate for the middle block between Aldwych and the Strand. To accept that offer as it stood would make it impossible to carry out the plan of the Further Strand improvement committee, as it was necessary to set back the crescent facing the church of St. Mary and reduce the length of the middle block if the eastern projection into the Strand was to be set back the 60 feet required to give the Strand its natural course direct to and from the Courts of Justice. The executive committee considered that the improvement advocated was necessary, and that it would, therefore, be superfluous to deal with figures in the memorial. A sacrifice, they admitted, might have to be made, but against that sacrifice the following clear gains would accrue: a direct roadway connecting the West End with the City, instead of a serpentine course dangerous to traffic; an island pavement

forming an oasis (with trees, &c.) of about 12,560 square feet—the area of the building land that they asked might be surrendered—in the busiest thoroughfare of the Metropolis midway between St. Paul's and Trafalgar Square; an increase in the value of the building land facing the greatly improved thoroughfare; an early cancelling of the great annual loss resulting from the building land remaining vacant.

Sir E. Poynter, P.R.A., said that the County Council had been approached three times with memorials in favour of a plan by which this unique opportunity for carrying out a dignified architectural scheme worthy of London should not be thrown away, and the memorials had received but scant attention from those to whom they were addressed. It therefore seemed right to the Royal Academy to take the matter up as one deserving of its attention as a corporate body. The memorial was unanimously adopted as an expression of the views of the Royal Academy and was signed by all the members. Later on the Council of the Royal Academy without hesitation adopted his suggestion that a meeting should be held in the Academy itself, to which all those who had signed the memorial should be invited. This was one of those exceptional occasions when questions of economy might be rightly subordinated to higher considerations and must be set aside when such an opportunity occurred as the present. The County Council has invited the opinion of the public by staking out two courses which the new road might follow; the strange thing was that when the public expressed so marked a preference for the direct alignment they should have adopted the other. They would almost appear to have gone out of their way to spoil their original idea of a symmetrical arrangement in crescent form with a straight frontage to the Strand.

Lord Plymouth moved:—"That, in the opinion of this meeting, the memorial of the Further Strand improvement committee, the Royal Academy of Arts and other corporate bodies makes a clear case against the plan adopted for the building land between Aldwych and the Strand, and that the London County Council be requested to receive a deputation charged with the duty of presenting the memorial."

Mr. Harold Cox, M.P., seconded the motion.

Mr. Frederic Harrison, who was chairman of the improvements committee of the Council when the original scheme of the Strand improvement was planned, supported the resolution.

Sir Aston Webb, R.A., said that the Royal Institute of British Architects felt very strongly that a great mistake would be committed if some alteration were not made in the alignment proposed. All his brother architects felt, as he did, that they could not appeal too strongly to the London County Council to make some alteration in the line and give London a magnificent thoroughfare from Charing Cross to St. Paul's Cathedral.

Sir W. Richmond, R.A., said that the County Council should appoint a small but thoroughly representative art standing committee through whose hands all metropolitan schemes must pass.

Mr. Hamo Thornycroft, R.A., said that he was the first to bring this question forward. It was not too late to remedy the error which had been made.

The resolution was then adopted unanimously.

A vote of thanks was passed to the President and Council of the Royal Academy for the support they had given to the Further Strand improvement committee.

AN ENGINEER'S CLAIM.

DURING several years Mr. William Mackison, F.R.I.B.A., has filled the office of burgh surveyor in Dundee, and as such has been the leading authority on building. In 1868 he received from the Commissioners of Police the appointment of "surveyor of police and sanitary inspector," with a salary of 400*l.* a year. Of that sum 100*l.* was to be considered as payment to him as sanitary inspector. Recently it was proposed in the Town Council "that the town clerk be instructed to conduct an inquiry into all the circumstances concerning the management of the burgh engineer's establishment, with special reference to that official's alleged total incapacity for the performance of his duties, and to report fully on what work the burgh engineer had remitted to him at any time which he failed to carry out, and also on any piece of work which was not submitted to him but placed directly in the hands of subordinate officials, mentioning the dates in each case." It was afterwards suggested that Mr. Mackison should retire from the office of burgh engineer and accept 250*l.* a year as consulting engineer. The Trades Council, who are a power in Dundee, opposed the arrangement. A special committee to deal with the matter was appointed.

Mr. Mackison, on the other hand, stated that he had no intention of retiring from his position, inasmuch as he felt himself quite fit for the work, and that, in any event, before considering any proposal involving his superannuation, he desired to have settled the claim that he had against the Council for services other than those of his official duties. The special committee stated that they had no knowledge of any claim, which they declined to recognise in any way. Mr. Mackison was asked to furnish particulars, which were duly sent to the town clerk with the following letter:—

8 Constitution Terrace, Dundee: March 16, 1906.

Dear Sir,—In compliance with the request of the Town Council, I send you a memorandum of the parliamentary, engineering and other work executed by me outside of the duties of my office of burgh surveyor. As the Town Council are aware, that work was performed by me on their instructions, and on the understanding that I should receive suitable remuneration for it. Particulars of my fees for some of the earlier work were at their request prepared by me and submitted to the Council, and these have from time to time been under consideration of committees. The attention of the Council was also from time to time called to them by the late town clerk, but the matter was allowed to lie over from year to year, while the continuous nature of the work did not afford a convenient occasion for closing the account. Looking to the long delay that has occurred in the settlement, I trust that the Town Council will now see their way to take the matter up at an early date.

On the perusal of the memorandum it will be seen that the works carried out by me are large in extent and varied in character. In other cities, where similar works have been carried out by outside engineers, large sums have been paid in professional fees, based usually upon a percentage of the cost. I believe, after a settlement of my charges, it will be found that it has been a great advantage—from the point of view of cost, time and efficiency—that these works, in the case of Dundee, have been carried out under my direction, instead of under that of an outside engineer.

I believe, as I stated in the memorandum, that the information it contains will be sufficient, in the meantime, to enable the Town Council to judge of the general character of my claim and how best to have it adjusted. If agreeable to the Council, I am willing to have the amount to which I am entitled fixed by a reference to a neutral engineer, or, if they prefer, to have it settled by a friendly action in Court.

I have only to add that, considering my connection of nearly forty years with the municipality of Dundee, I sincerely trust that the friendly intercourse I have enjoyed in the past and the great pleasure I have had in doing the work of the city—to which I have devoted my time and best energies, not only during the usual working hours of the day, but for long periods, almost continuously, at other hours, both early morning and late at night—and which pleasure has been greatly enhanced by the knowledge that I have held, continuously and unbroken, the full confidence of the community and their representatives, may not now be marred by any unpleasantness in arriving at a just settlement, and that a fair and equitable arrangement, satisfactory to both parties, may be come to soon.—Yours faithfully,

WM. MACKISON.

A meeting of the works committee will be held next week to consider and determine upon the matter.

According to the *Dundee Advertiser*, to which we are indebted for the foregoing information, the statement on which Mr. William Mackison bases his claim for remuneration for extra services rendered is a lengthy document, extending to no fewer than forty-eight pages. To any one undertaking the task of writing the history of municipal enterprise in the city since 1868—the year when Mr. Mackison was appointed—the document would prove of great value, as it contains details of nearly every work of importance undertaken by the Corporation during the intervening thirty-eight years. He points out that in 1868 the population of Dundee was 90,000 and that now it is 160,000, and enters in detail into the circumstances surrounding the water engineership of the city. When the late Mr. Duncan left the service, soon after the water concern was acquired by the Corporation, Mr. Mackison was appointed water

Digitized by Google

manager and engineer in addition to burgh surveyor. This position, however, he held for only twenty-one months, when Mr. Watson, now of Bradford, was selected to look after the water department. Notes are given in the statement as to the increases of salary which were voted to Mr. Watson, and also as regarding the honorariums which were paid to that official for special services rendered. Mr. Mackison does not specify on any sum to which he thinks he is entitled, but claims that he should be paid specially for services in promoting the Improvement Bill of 1871 and work after it had become law, special mention being made of the elevations he prepared for Commercial Street buildings; for the erection of the markets and slaughter-houses and all the district baths and washhouses; the construction of the esplanade west of the Tay Bridge; laying-out Magdalen Green, Barrack Park and the Albert Institute grounds, several new streets, and the reconstruction of the tramways; his labours connected with the projected scheme for a cable tramway up Constitution Road, and the erection of tramway shelters. Mr. Mackison gives the total cost of the work in each case. He further asserts that he was appointed sanitary inspector at a salary of 100 guineas per annum, and that the Corporation owe him 100*l.* a year for many years in this connection.

Mr. Mackison expresses his willingness to refer the whole matter to an arbiter mutually chosen, or to agree to a friendly action in the Court of Session. The statement will be submitted to an early meeting of the special committee appointed recently to deal with the whole case of the burgh engineer's appointment, the committee consisting of the whole of the members of the works committee, with Messrs. Brownlee, Gordon, Stevenson and Soutar added. This committee, it is understood, will conduct the inquiry which the Council instructed should be held, in order to be able to report the result of their deliberations before the date specified, viz. March 29.

THE TRIBUNAL OF APPEAL.

IN the report of the Building Act committee of the London County Council is the following statement respecting an application for increase of fees from the members of the Tribunal of Appeal:—

We have had under consideration a letter from the Home Secretary forwarding, for the observations of the Council, a copy of a letter received from the members of the Tribunal of Appeal constituted under Section 175 of the London Building Act, 1894, asking that the rate of remuneration granted to them in respect of their services may be increased. In accordance with the terms of Section 179 of the Act, the Home Secretary in 1894 decided that the members of the Tribunal should be paid by fees, and fixed the amount of the fees at three guineas for the first hour and two guineas for each subsequent hour of each day's sitting of the Tribunal, and in 1895 it was laid down that such remuneration was limited to the sitting of the Tribunal in its judicial capacity. The amount of the fees then fixed has remained unchanged up to the present.

The members of the Tribunal ask that the rate of remuneration may be increased to five guineas for the first hour and three guineas for each subsequent hour or part of an hour, and that each member should receive a minimum fee of twelve guineas in respect of each appeal when an appointment has been fixed, whether the case is argued before the Tribunal or not, and further that such fees should be paid whether the members of the Tribunal are acting judicially or not, provided they are employed in the work of the Tribunal.

It is stated that the maximum amount earned by any member of the Tribunal during the ten years 1895-1904 inclusive was 940*l.* 16*s.*, which was paid in respect of 103 appeals, five of which were settled without being heard, and the average amount received in respect of the ninety-eight sittings of an average duration of rather less than four hours was thus 9*l.* 12*s.* This amount appears to us to be sufficient, even if the members are prevented from making professional appointments on the days fixed for the hearing of appeals.

The increased number of appeals which may be made under the London Building Acts (Amendment) Act, 1905, is advanced by the members of the Tribunal as one reason why the rate of remuneration should be increased. It is, of course, impossible at the present time to form any opinion as to what the number of appeals under the new Act may be, but we are of opinion that, should the number be large, it would probably be found advisable for the Tribunal to sit at stated intervals, and if necessary to continue the sittings from day to day until all the cases then before them had been settled. Should this be the case, and assuming that the sittings lasted six hours each day, the average remuneration for each member would be about thirteen guineas, and we are, therefore, strengthened in our opinion that the present scale of fees is adequate.

We would point out that the whole of the expenses of the Tribunal of Appeal, including the fees in question, are payable by the Council, which also receives the fees paid by the parties to appeals. The net annual expenditure in respect of the Tribunal since its constitution in 1894 has been as follows:—

1894-5	£40	3	4	1900-1	£547	10	8
1895-6	805	19	7	1901-2	770	10	4
1896-7	621	4	3	1902-3	734	15	9
1897-8	592	2	1	1903-4	707	3	10
1898-9	612	3	6	1904-5	544	15	9
1899-1900	593	1	3				

We recommend:—"That the Secretary of State for the Home Department be informed that the Council is of opinion that the present rate of remuneration of members of the Tribunal of Appeal, constituted under Section 175 of the London Building Act, 1894, is sufficient, and that no adequate reason is shown why it should be increased.

CANTERBURY CATHEDRAL LIBRARY.

A MEETING of the Bibliographical Society was held on Monday, when Mr. M. Beazeley read a paper on "The History of the Chapter Library of Canterbury Cathedral." After acknowledging his indebtedness to Dr. James and other writers on the subject, he said there was no doubt that a commencement was made with the books sent by Pope Gregory to St. Augustine. Archbishop Theodore brought many MSS. from the East, including classical works, though the Homer attributed to him by Parker was written on a material unknown in his time. There were only a few fragments existing of anything previous to the Norman Conquest. Much was destroyed by the Danes, and more by a later disastrous fire. Lanfranc began to rebuild the cathedral, but although he drew up rules for the library he did not provide a special building for it. It was arranged in the rules that the precentor was to be librarian "if he were an educated man." Lanfranc, Anselm and their successors no doubt added considerably to the library, but, unfortunately, there was no catalogue. In Becket's time there were probably 600 or 700 books, and bequests were made for the support of the library in 1285 and 1313. From a list of the fourteenth century it appeared that there were a large number not only of theological and patristic works, but scientific and classical, Ovid being especially well represented. There was also the original charter which settled the precedence of the Primates of Canterbury and York, attested by the signatures of William the Conqueror and his queen, represented by crosses. In 1337 an inspection of the library showed that the privilege of using the library was not confined to the monks, and seventy-four volumes were reported missing, including seventeen lent to "seculars." Prior Chillenden, who died in 1411, bequeathed many books to the new library which had been built by Archbishop Chicheley in 1396 over the prior's chapel. In 1432 the Chapter recorded its high appreciation of the library and its furnishing. In 1538 a fire which broke out in an adjoining building destroyed the collections of Theodore and Chicheley. The library suffered greatly in later years by the depredations of Archbishops Parker and Whitgift and Dean Nevill, and still later in the time of the Great Rebellion. In 1670 there were enough books to catalogue, and a librarian was appointed at a salary of 7*l.* a year, for whose guidance a fresh set of rules was framed for the first time since Lanfranc's. The library was first thrown open to the public in 1840, and a new building was erected in 1868. The latest list of works gave the number as 12,115.

Dr. James J. Dobbie, in his report on the Royal Scottish Museum for the year 1905, says that the number of visitors to the museum was considerably in excess of the average of the previous five years. The large attendance on Sunday afternoons, when the collections are open for three hours, shows how greatly even this limited privilege is appreciated by the public. It is stated that the Sunday visitors evince an unmistakable interest in the contents of the museum.

ALDWYCH CRESCENT.

THE improvements committee of the London County Council announce the consideration of a proposal for a lease for ninety-nine years, at a rent of 55,000*l.* a year, of the central portion of the crescent site formed in connection with the Holborn to Strand improvement. The site has an area of about 123,350 square feet, and lies between Aldwych and the Strand, being bounded on the east and west by the 50 feet approaches which it is proposed to form between the Strand and Aldwych. It has frontages of about 636 feet to Aldwych, about 413 feet to the Strand, about 236 feet to the approach on the west side of the site and about 231 feet to that on the east side. The proposal has been made by Mr. L. Wormser on behalf of a syndicate who have prepared a scheme for developing the site as a whole. A company is to be formed for this object with a capital of 1,000,000*l.*, and arrangements have been made for underwriting nearly the whole of this amount. From inquiries made through the Council's bankers, it appears that the necessary capital will be forthcoming, and that the financial position of the underwriters justifies the Council in favourably considering the present offer.

It is proposed to erect on the central portion of the site a stone building of commanding architectural features. This building will contain large galleries for use in connection with a permanent exhibition of arts and manufactures; it will also contain a theatre, a concert hall and a restaurant. Beyond the central block of buildings the site will be enclosed by shops with basements, ground floors and two floors above. There will be seventy-eight shops on the ground floor and seventy-eight on the first floor, while the second floor will be let for commercial purposes. The promoters have undertaken to spend not less than 500,000*l.* in the erection of these buildings. They state that negotiations have already been commenced for letting portions of the buildings, and that they have no doubt as to the disposal of the whole to substantial tenants. There will be no larger area between the shops and the central building than that which is necessary to provide for the access of light and air. The plans, elevations and specifications of all the buildings will be entirely subject to the Council's approval.

The lease will be in the Council's usual form, subject to such modifications as may be necessary for the special undertaking, and will give the Council entire control as to the uses to which the buildings will be put, and also the right of re-entry if the buildings are put to any other use than that sanctioned when the lease is taken up.

One year's ground rent (55,000*l.*) will be paid as a deposit upon the signing of the building agreement; this deposit will be forfeited if the lease be not taken up, so that the Council's interests are adequately safeguarded. The promoters propose that the first year's rent shall be a peppercorn, and that the rent for the second and third years shall be at the rate of 27,500*l.* a year.

The recommendation was accepted by the County Council on Tuesday.

GENERAL.

Mr. L. F. Vernon-Harcourt has received the title of Emeritus Professor of Civil Engineering and Surveying from the Council of London University. Mr. Vernon-Harcourt occupied the chair of Civil Engineering at University College for twenty-three years.

Mr. W. E. Bush, borough engineer and surveyor of Sudbury, Suffolk, has been appointed city engineer of Auckland, New Zealand, at a salary of 1,000*l.* per annum.

A Memorial to the late Mr. Alfred Waterhouse, R.A., of Yattendon Court, is contemplated in the parish of Yattendon, where the architect spent the closing years of his life. The form which the memorial will take has not been yet decided.

Mr. F. P. Oakley, architect, has prepared a scheme for the restoration of Tarven Church, Cheshire, at a cost of over 2,000*l.* In the fourteenth century what now constitutes the south aisle and Bruen chapel was built, and some of its architecture, including the valuable screen, remain to this day. From 1400 to 1500 the nave, north aisle and tower were built. The chancel was probably rebuilt in 1700.

The Photographic Survey and Record Society of Surrey held their annual meeting at Kingston. According to the report 697 photographic prints were received during the year, as against 660 in 1904. Five exhibitions of a successful kind were held during the year. In the architectural section the Society received 307 prints and these were of a very excellent kind.

The Court of Common Council last week decided that with a view to restoring the Guildhall to its original beauty and impressiveness, it be referred to the City Lands committee to consider and report on the desirability of removing from the walls and columns of the interior of the hall the plaster or stucco with which they have been encrusted or disfigured.

The British Museum is to be equipped with new lightning-conductors at an outlay of 450*l.* There will be other improvements undertaken shortly, including a new ceiling light to be introduced into the Etruscan saloon.

The Society of Architects are to visit the new Sessions House, Old Bailey, on Saturday, the 24th inst.

The Council of the Liverpool University have decided to establish a chair of classical archæology for three years, with the help of a guarantee fund. There is reason to hope that the chair may be set on a permanent footing before the three years have expired. The Council have elected to the professorship Mr. Robert Carr Bosanquet. Mr. Bosanquet, who held the Craven studentship of the University of Cambridge for two years after taking his degree in 1894, has for the last six years been director of the British School at Athens. One of the conditions of his appointment is that he shall have leave of absence for at least one term in the year, to enable him to conduct practical research work and so to keep in touch with the explorations that have added so largely to our knowledge of antiquity in recent years.

The Sutton Coldfield Education Committee considered twelve sets of competitive plans for the proposed new schools in Victoria Road, Reddicap Heath and Green Lanes. It was agreed that those of Messrs. Crouch, Butler & R. Savage should be accepted subject to certain modifications.

A Meeting will be held on the 30th inst. at the Jehanghir Hall of the University of London, South Kensington, to make arrangements for the International Congress on School Hygiene, which is to take place in London from August 5 to August 10.

Mr. John Mackay, of Reay House, Bodenham Road, Hereford, who died on February 5, civil engineer, left estate valued at 31,663*l.* gross, with net personalty 29,313*l.* He bequeathed an annuity of 45*l.* to the Educational Association of Rogart for scholarships of 25*l.* and 20*l.* respectively.

Professor Flinders Petrie has stated that he intends to send to the Chief Rabbi (Dr. Adler), for presentation to one of the London synagogues, the marble shaft of a pillar found on the site of the Temple of Onias, as the result of excavations by the British School of Archæology in Egypt.

Messrs. J. B. & W. Thornley, architects, Wigan, have received the first premium of 40*l.* in the competition for a free library at Wigan. The second premium of 20*l.* has been awarded to Messrs. Heaton, Ralph & Heaton.

Mr. C. F. Corbould-Ellis, chairman of the library and art committee of the Corporation of London, has been appointed a member of the British Commission for the Milan International Exhibition, 1906.

A Change is announced in the hours of admission to Glasgow Cathedral on week days. The hours formerly indicated on the notice board at the entrance to the cathedral were:—"From March 1 to October 31, 10 A.M. to 6 P.M.; from November 1 to February 28, 10 A.M. to 4 P.M." The hours now shown on the notice board are:—"From April 1 to September 30, 10 A.M. to 6 P.M.; from October 1 to March 31, 10 A.M. to 4 P.M." The change has been made on account of the frequent want of daylight in many portions of the building between 4 and 6 P.M. during the months of March and October, and the risk of accidents to visitors through darkness on stairs, &c., during these months.

The Middlesbrough Town Council having decided to oppose the scheme for building a transporter bridge across the Tees, the Transporter Syndicate offered to pay the Corporation 1,250*l.* for five years, and 10 per cent. of the gross takings afterwards, or, in the alternative, 10 per cent. of the gross takings from the opening of the bridge. The offer came before the Council last week, when the following resolution was passed:—"The Corporation respectfully decline to accept the offer made by the promoters, but would not be indisposed to negotiate with them on the basis of the Corporation being the owners of the bridge and the tramways on the south side, and to co-operate with them in the scheme they have foreshadowed in the order deposited."

The Royal Scottish Academy on Wednesday elected three Associates, viz. Mr. R. M. G. Coventry, of Glasgow, painter; Mr. Percy Portsmouth, Edinburgh, sculptor; and Mr. James Miller, Glasgow, architect.

The Architect.

THE WEEK.

A PAINTER like the late EUGÈNE CARRIÈRE, who died in Paris on Tuesday morning, is not often produced by the most elaborate system of instruction, and French art has lost an unique representative. There could be no better proof of his ability than the praise awarded to him by EDMOND DE GONCOURT, who was not only fastidious, but also irreverent towards the majority of modern efforts. He described CARRIÈRE as a "VELASQUEZ crépusculaire," and the few words suggest the peculiarities of the painter. What was still more remarkable, as GONCOURT said, was his being "le peintre de l'allaitement," an office or duty not much respected by the artists of Paris. CARRIÈRE was, however, a painter of Parisian scenes, and he was fascinated by the crowds on the boulevards, but his representations were never as popular as those of M. BERAUD. Indeed, his vaporous tones seem better adapted for London scenes than for those in the French capital. He spent some months in London, but the "silence" terrified him, and for a long time he found a difficulty in earning any money. On the whole he was most successful with scenes in ordinary apartments, especially when introducing a number of children. He was born in 1849 at Gourney, but in his early years he lived in Strasburg. At the time of the Franco-German war he left the Ecole des Beaux-Arts with several other students to take a part in the fighting. He suffered imprisonment and then returned to Paris. He failed in the competition for the Prix de Rome. He was then thrown on his own resources, and it may be said that he had no other models than his wife and children. He never could be considered as a popular painter, but during his recent years he was able to secure a small but select number of fervent admirers.

WHEN BARRY undertook the alterations of the Privy Council Office, Board of Trade and Treasury at Whitehall, he had to deal with a building having a continuous skyline. In his design he imparted greater solidity by introducing an extra storey at each end. That arrangement was not without effect upon the late J. M. BRYDON in his design for the Government offices. Facing Whitehall, the building was slightly raised in the centre and at each end. But on the Charles Street front he introduced two structures recalling the clock towers of St. Paul's. They were imposing, but the effect of them diminished the light in the India and Local Government Board offices. The First Commissioner of Works explained to the House of Commons on Tuesday that after consultation with the architects of the Office of Works and the advisory committee, he decided that the towers on the Charles Street side are not to be carried out to the full height. It has not yet been arranged to what extent the front towards Great George Street will be modified. No decision can be given until the part of the building towards St. James's Park is more advanced.

THE claim which Mr. MACKISON, the burgh engineer, has sent to the Corporation of Dundee for special work amounts, it is believed, to more than 40,000*l.* It must, however, be remembered that he filled several offices. He was also parliamentary engineer for nearly all the works for which Acts had to be obtained. The account represents the work of a great many years. It may be doubted whether the Dundee Corporation would have been able to find an engineer of standing in Westminster who would carry out such a multiplicity of varied work for the same sum. If Mr. MACKISON had not been successful in the preparation of plans and estimates, and in the superintendence of operations, he would not have held office since 1868. The fact that the Corporation retained him for so lengthened a period is a testimony that his conduct of business worked smoothly and advantageously for Dundee. The claim was discussed at a special meeting of the Town Council on Monday. It was moved that the Council should repudiate all liability for remuneration in respect of overwork, and while willing to pay any money which may be due, they are not in a position to offer any sum by way of compromise, and can only settle the claim under a decree of the Courts. After a discussion thirteen members were in favour of repudiation of the claim, while ten were in favour of an amendment which proposed that the town clerk should be instructed to report on the subject. The result will no doubt be gratifying to the ratepayers, for both engineers and architects are popularly supposed to represent expenditure which is not always profitable. But whatever may be the result the case should be taken as a warning by officials, as well as by authorities, to avoid the procrastinating policy of seeking a favourable time for the settlement of accounts, which in the majority of instances never arises.

IT is not often we find such diversity of opinion as is expressed regarding the disposal of the Holborn town hall. It presents the appearance of having been erected when economy prevailed, for it cannot be said that much money was expended on ornamentation, yet the building cost 39,717*l.*, and, in addition, 18,000*l.* had to be paid for the site. A further sum of 16,000*l.* has been expended on the building. About a fifth of the cost remains unpaid. The hall is frequently hired for balls, but during the last five years it has entailed a loss on the ratepayers of Holborn borough of 1,965*l.* a year. The Mayor maintains that the town hall was never built with the idea of providing offices for a municipal body, and no matter how it was altered it would be impossible to carry on the administrative work of the borough within it. The Council consider that it is imperative to erect a new building in which accommodation for the whole of the staff can be obtained. It is remarkable that the Council have not fortified their opinion by calling in an independent architect. The present building does not seem to be adaptable, but it would have been wiser, in order to afford satisfaction, if some one who is acquainted with the planning of municipal buildings were to define the extent of what is feasible. One member of the Council went so far as to suggest that if the town hall had to be sold a price should be put on it by the Local Government Board. His suggestion is enough to show the variance which exists, and which is not favourable to economy.

THE Bill which was introduced this week by the Home Secretary for extending and consolidating the Workmen's Compensation Act is likely to be popular with builders on a small scale. Unless in cases where disease is caused by poisoning with lead, phosphorus, &c., employers whose workmen do not exceed five in number are proposed to be excluded from the operations of the Bill. Workmen are likely to object that employers of that class do not always possess scaffolding or plant which is perfectly sound, and in order to avoid the expense of setting up scaffolding the men are sometimes expected to take part in hazardous operations. The exemption will not satisfy building workmen and should be set aside. Sub-contractors, on the other hand, will grumble, for the workman and his advisers will not have to speculate about the party to be sued, and moreover, the general contractor or principal will have the right to indemnify himself against the sub-contractor. The Workmen's Compensation Act has unquestionably caused a large amount of suffering to men who have reached the fifties, for they are not in favour with the insurance societies. It is now proposed to deal with the evil by diminishing the rate of compensation for workmen who are over sixty. In practice it will be found that few men of that age will be in a position to claim compensation. If they are employed it is possible they will have to submit to a reduction of wages.

ARCHITECTS, ENGINEERS AND CONTRACTORS.

IF we believe VIOLLET-LE-DUC, some arrangement resembling the contract system was practised in Mediæval times. While in society there were ambitious kings, tyrannous lords and a suffering peasantry who were little better than slaves, a class of men appeared, he says, who were devoted to scientific building and who were able to attract to their service artisans of various classes, who were willing to submit to a discipline that was severe. In England almost to the eighteenth century it was sometimes difficult to discriminate between the builder and the architect. The combination of the two classes of work was occasionally exhibited at a much later time. Sir CHARLES BARRY, for example, entered into a competition with other architects for the town hall at Birmingham. But they were all cut out by JOSEPH HANSOM, who offered to construct the building and, as it were, to throw in the designs as if they had no independent value. The work was accomplished, and still serves for a variety of uses, although HANSOM suffered loss through his enterprise. The perpetuation of the old arrangements might have had some advantages in an artistic sense. But convenience and economy dictated that there should be a separation, and that the designer was to be independent of the constructor.

The Mediæval buildings, and especially the churches, which are the most characteristic examples, required a great many years to pass before they could be considered as complete. Indeed, it sometimes happened that a noble building was never entirely finished. The architect, workmen and clergy might be anxious to see the fulfilment of their efforts, but financial and other obstacles were not easily overcome. Under those circumstances the architect, designer or master of works would hold a very close connection with his workmen, and would be glad to take advantage of any opportunity which offered for continuing operations, even if they were only limited in extent.

With modern works expedition is essential. A noteworthy case, which may be said to have inaugurated the system now adopted with buildings, was the exhibition building in Hyde Park in 1851. If PAXTON had to carry out the works the exhibition would not have opened till some years had elapsed. But by giving the order to a firm of contractors the whole work was completed in less than a year. The popular amazement is expressed in THACKERAY'S "May-day Ode," in which the lucid glass structure is said to have sprung like a fountain from the grass to meet the sun. FOX & HENDERSON obtained possession of the land on July 30, 1850. So great was the hurry there was none of the usual legal procedure. The contractors had not even the security of any deed, and legally could not claim for the money they expended during several months. Yet on the 1st of the following May the "rare pavilion such as man saw never since mankind began" was opened to receive all the nations. At the present time the preparation and erection of 4,000 tons of wrought ironwork and acres of glazing may seem a trifle, but in 1851 it was a memorable feat, and it demonstrated beyond all doubt that for the great works which were to mark the second half of the nineteenth century the co-operation of contractors was indispensable. This fact should be remembered by the visionaries who imagine that by imparting to a student of architecture such a knowledge of "crafts" as can be acquired in a few evenings it will be possible to regain the old-fashioned system of carrying out buildings without a contractor, even when they have to be extensive.

The exhibition building merely illustrated on a scale which could be realised by the multitude the kind of effort which was displayed in England and on the Continent by English contractors for the construction of railways. When we think of the magnitude of the works for which an organisation had to be devised as it were impromptu, the ability of the contractors must always be recognised as evidence of the innate power of Englishmen. Some of those who took up contracts had been only navvies, and many men who had carried out difficult works would find it onerous to write a description of how they contrived to make the arrangements. Much of what had to be done was novel. But no matter what obstacles were offered by nature, they were overcome. It was said before Parliament that no man in his senses would attempt a railway across Chat Moss, parts of which were 40 feet deep. But the laying of the line was one of the early operations of the STEPHENSONS.

It is remarkable that even in those days the engineers endeavoured to obtain the services of particular contractors. THOMAS BRASSEY constructed most of the lines of which JOSEPH LOCKE was the engineer. He had a reputation for making his lines pay dividends to the shareholders, and he was confident that with BRASSEY and his partner there would be no scamping, and repairs would not be costly. ROBERT STEPHENSON also favoured the firm, but he was always sure of attracting the best class of contractors. He was willing to publicly recognise the value of their aid, and it gave him pleasure to know that a contract had turned out profitably.

An architect must look at work in a way which differs from an engineer's. A long stretch of railway may consist of nothing more than open cuttings which afford materials for the embankments, a few unimportant bridges over roads and streams, and permanent way. Everything is simple; the lines of rails may be straight or laid out on definite curves. With a building the cares are more numerous and exacting. Form has to be carefully considered, and the angle of a pediment if erroneously set up is enough to affect the character of a building. It is therefore easily understood why architects when they meet with a contractor who understands and is anxious to realise their spirit should always desire that he should have a monopoly of their work. An example of this spirit is afforded to us by the relations between A. W. N. WELBY PUGIN, or PUGIN II., and Mr. MYERS. There was no doubt the artist was an innovator, and his Gothic did not correspond with the style to which builders were accustomed in the occasional work of the thirties and forties of the last century. When PUGIN first met him MYERS was a workman. But MYERS was no mere mechanic. Afterwards MYERS contemplated tendering for PUGIN'S church at Derby. PUGIN, we are told, recognised him, and clasping him in his arms, like a true Frenchman, exclaimed, "My good fellow, you are the very man I want; you shall execute all my buildings." The artist kept his word, for the greater number of his churches were erected by MYERS. In his turn MYERS inspired young workmen with a desire to rival Mediæval carving, and took care that they should have before them casts of the finest examples in order that they might be induced to aim high. PUGIN found another zealous aid in Mr. MINTON, of Stoke-on-Trent, whose encaustic tiles were declared to be superior to any ancient work, and were the best in the world. But when PUGIN broke down he wrote to Mr. MINTON:—"Pray, my dear MINTON, don't agitate me; the doctors say that I am not to be agitated. If you saw your poor old friend so reduced as I am—thin, trembling, hollow-eyed, changed, and yet working tremendously at times—you would be very careful not to distress me." Soon after his illness assumed another form, and he informed Mr. MINTON that henceforth he would give his commissions to other manufacturers. His friend, who understood the true state of the calamity, wrote to Mrs. PUGIN expressing his ignorance of any cause of offence. In reply, PUGIN apologised and said:—"You must attribute a good deal to the dreadful irritation of nerves under which I suffered; but nothing would contribute so much to the final re-establishment of my improved health as a real and hearty reconciliation with you." And there was appended to the letter a rough sketch showing PUGIN and MINTON embracing each other over

Digitized by Google

an altar inscribed "Pax PUGIN et MINTON," and on each side a crowd of people shouting, "Pax MINTON et PUGIN." At the foot there is placed in antique characters, as a border tile, "Pax in æternum. The last pattern, A. W. PUGIN fecit." A few months afterwards PUGIN had passed away.

In these cases we can see a friendliness between an architect, a contractor and a sub-contractor of a kind which is not usual in our time. Price rules an architect's wishes. He is able to stipulate for certain work being done by sub-contractors on whom he can rely, and in that way his ideas can be at least partially embodied in a proper manner. Indeed, at the present time it may be said that the most satisfactory part of an architect's business lies with sub-contractors. It must, however, be allowed that when parts only of a building are executed as the architect desires there is a possibility that critics will be puzzled by the difference and will be uncertain about how much the architect approved. A contractor like Mr. MYERS is not found in every large town, but tiles like those which satisfied PUGIN fortunately are still obtainable. The same fact is evident in other classes of work. The circumstances under which the majority of modern buildings have to be raised are not always favourable to the production of loyal builders, but as the number of specialists is increasing it becomes easy to obtain at least some of the details necessary for a building of a kind which is deserving of high commendation.

THE REPORT OF THE ROYAL COMMISSION ON TRADE DISPUTES.

By W. S. HOLDSWORTH, D.C.L.

I.

THIS report contains a valuable summary of the history of the important subject, valuable notes upon admitted obscurities in the law relating to it, and a clear statement of the principles which ought to be kept in view by the Legislature which attempts to deal with it, together with suggestions as to particular modifications of or additions to the existing law required to carry these principles into effect. The Commissioners did not arrive at a unanimous report; indeed it was hardly expected that they would be able to do so. But, as we shall see, there is a considerably greater unanimity in their views upon the nature and causes of the evils which require to be remedied than is to be found in their views as to the means by which they ought to be remedied. The majority report is signed by Lord DUNEDIN, Mr. ARTHUR COHEN and Mr. SIDNEY WEBB. There are separate reports signed by Sir GODFREY LUSHINGTON and Sir WILLIAM T. LEWIS, and there are learned notes upon the legal questions involved by Mr. ARTHUR COHEN.

The Commissioners who signed the majority report divide their report into three heads:—(1) The liability of trade union funds to be taken in execution for the wrongful acts of agents of the union. This involves a consideration of the Taff Vale Case (1901, A.C. 426). (2) The statute law relating to picketing and other incidents of strikes. It also involves a consideration of such cases as LYONS *v.* WILKINS (1896, 1 Ch. 811; 1899, 1 Ch. 255). (3) The law of conspiracy as affecting trade unions, and involving a consideration of the decision in QUINN *v.* LEATHEM (1901, A.C. 495). We propose to consider some of the recommendations of the Commissioners upon these three subjects. In this paper we shall deal with the first, and in some ways the most important of them all. We shall hope in a succeeding paper to discuss the subjects of picketing and conspiracy.

The opinion of the Commissioners upon the first head—the liability of trade union funds—is unanimous against disturbing the Taff Vale decision. They show conclusively that, though the decision took many by surprise, it effected no change in the law. "We are satisfied," they say in Section 15 of the report, "that the law laid down by the House of Lords involved no new principle and was not inconsistent with the legislation of 1871." The original history of the causes of the mistaken belief that trade union funds were sacrosanct is traced in detail. This history is valuable as dispelling much of the confusion which has gathered round this subject, and we think that too great publicity cannot be given to it. In outline it is as follows:—Trade unions up till recent years have not appeared in the law courts either as plaintiffs or defendants. This was, no doubt, the foundation of the belief that they could not be sued nor their funds made liable. But this was due, not to any idea of their immunity from legal process, but to two distinct causes of a very different kind. In the first place, till 1871 they were unlawful associations. This clearly prevented their appearance as plaintiffs. In the second place the rules of procedure obtaining in the Common Law Courts prevented any person's property from being taken in execution, unless such person was on the record as a defendant. "If, therefore, an association consisted of so large a number of persons that it was impracticable to ascertain the names of all of them or to make them all defendants, the property of the association, as distinguished from that of the individual members, could not be taken in execution in a Common Law action. The difficulty, of course, was not confined to cases against trade unions—it equally affected cases against clubs, and all unincorporated associations with a number of members, and, it may be added, whether the action was in tort or upon contract." This difficulty did not arise in the case of proceedings taken in Chancery. There it was possible to sue a few persons as representing a larger number, and the decision bound all; this, however, did not affect trade unions, as the Court of Chancery did not hear ordinary actions for damages arising out of tort. It was this difficulty which prevented their appearance as defendants.

The first of these difficulties was swept away in 1871. The trade unions were made lawful societies, but they were not incorporated, and certain agreements entered into by them were not to be enforceable at law (see *The Architect*, June 24, 1904). They were allowed to sue in tort for the protection of their funds, but the Act said nothing about their liability to be sued, so that the law on that point remained the same. Theoretically, their members might be sued, but difficulties of procedure barred the way.

In 1883 came a reform of procedure, the broad effect of which was to make it possible to use the Chancery procedure in all kinds of actions. It was not at first clear whether this change would enable actions in tort to be brought against a few persons as representing a large number. In 1891 the Court of Appeal decided that this could not be done. But their decision was based simply upon the interpretation of the new rule of Court, and not upon any such ground as the non-liability of the trade unions to be sued for tort. This interpretation of the rule was held by the House of Lords to have been mistaken in the case of the Duke of BEDFORD *v.* ELLIS (1901, A.C. 10)—a case which had nothing to do with trade unions. This case decided that any kind of action could be brought against a few persons as representing one interest, and that the decision would bind all interested. It would be true therefore to say that there was no law exempting trade unions from liability, but that there were difficulties in procedure which have now disappeared. Trade unionists, however, looking mainly at the facts of the continued immunity of trade union funds, and not knowing the causes of that immunity, were shocked and surprised when they discovered that the law had now found a way to make a practical reality that liability which had always in theory existed. As the Commissioners point out, with the exception of the assumptions made by the Royal Commission on Labour which reported in 1894, which assumptions were based upon an erroneous decision as

Digitized by Google

to the effect of one of the rules of the Supreme Court passed without special reference to trade unions, there was no reason whatever for thinking that trade union funds were exempt from liability. "No public commission as a body has represented that they ought to be exempt; no Government has promised that they would be exempt by forthcoming legislation, and no judge has pronounced that they are exempt." Their supposed exemption was an illusion based upon defects in legal procedure which have now been remedied.

As to the justice and equity of the Taff Vale decision, the Commissioners are quite clear. "There is no rule of law," they say, "so elementary, so universal, or so indispensable as the rule that a wrongdoer should be made to redress his wrong. If trade unions were exempt from this liability they would be the only exception, and it would then be right that that exception should be remedied." We said in *The Architect* (June 24, 1904), commenting on the provisions of the Trade Disputes Bill, 1904, that it was no new thing to find that persons or bodies who had recently acquired power should wish to see that power unlimited; but that such attempts had been defeated, and that the law remained supreme; that, in fact, to exempt any class or body of persons from the law would be more than an anomaly; it would be an attack upon the first principles of the Constitution. The Commissioners are of the same opinion. A claim, they say, to be beyond the reach of the law "has in former times been made by the spiritual as against the civil authorities, and has been consistently disallowed. What was denied to religion ought not, in our judgment, to be conceded to trade unionism." We may add that in the opinion of the Commissioners the result of the Taff Vale decision has been most beneficial. Trade unions have been more careful not to break the law, with the result that strikes have been less frequent and disputes have been more easy to settle.

After reading the sections of the majority report in which these opinions are expressed, most people will be surprised to learn that the Commissioners recommend legislation:—(1) "To provide for the facultative separation of the proper benefit funds of trade unions, such separation, if effected, to carry immunity from these funds being taken in execution," and (2) "To provide means whereby the central authorities of a union may protect themselves against the unauthorised and immediately disavowed acts of branch agents." If it is just, as the Commissioners admit, that the Taff Vale decision should stand, because it is just that the legal liability of the trade union should be the same as that of any other person or body, it is difficult to see why their funds should in those two ways be put into an exceptional position. On this point we think that the reports of Sir GODFREY LUSHINGTON and Sir WILLIAM T. LEWIS draw the only possible conclusion from the premises of the Commissioners themselves. "I dissent," says Sir GODFREY LUSHINGTON, "from the proposal in the report that the provident funds of trade unions should be exempt from liability. No reason is given for this but the encouragement of thrift. Thrift is a good object; but thrift comes after the payment of just debts, and certainly not least debts incurred in consequence of wrongdoing to others." If such a concession were made to a trade union, it would be just, on similar principles, that any person should claim that any insurance policies of which he was the owner should not be taken for payment of his debts. Similarly, there is no reason why trade unions should be given any exceptional privileges in respect of illegal acts done by their agents. A trade union which employs agents is an employer of labour. Why should not the ordinary law of employers' liability apply to it? There is just as much or as little difficulty in applying it to a trade union as there is in applying it to an individual employer. The result of such legislation as that proposed by the Commissioners would be to place trade unions under some peculiar rule of liability for the acts of their agents. This, as Sir GODFREY LUSHINGTON says, is much to be deprecated. "A more stringent liability than is imposed on others would be a hardship to trade unions, while a laxer rule would be unjust to those who may suffer from the tortious acts of trade unions and would impair the salutary effect of the Taff Vale judgment."

For these reasons we think that both these recommendations of the majority report are really inconsistent with the general principles upon which they are supposed to be founded. It cannot be denied that this seriously affects the practical value of the report. Its recommendations, being somewhat inconsistent with the reasons assigned for them, present the appearance of concessions made to the importunity of trade unionists. It is specially dangerous to show such signs of weakness, because a more important question remains behind—the question whether the trade unionists will be contented with these concessions. It appears to be very unlikely that they will either be contented with them or acquiesce in them. The trade unions declined to assist the labours of the Commission by giving evidence before it, and this must produce a bad impression upon the minds of impartial persons. Such a Commission is appointed to elicit the facts bearing upon a difficult problem, in order that upon the facts so elicited legislation may be framed to provide a solution. If the aims and desires of a section of the community are such that they will not bear the ordeal of the judicial examination which they receive at the hands of such a Commission, there is some ground for supposing that that section of the community means to promote its aims without regard either to their general expediency or to their justice. Under these circumstances we can only regret the more the presence of this inconsistency between the principles laid down and the recommendations suggested by the majority of the Commissioners. Those who will not deign to submit their views to the test of reason and argument can only be dealt with by a firm administration of a law which carries out as far as possible and as definitely as possible the principles of justice which all the Commissioners approve. "The constant fear of punishment," said HOBBES, "maketh men just;" but as a rule races which are civilised can observe some rudimentary principles of justice even though the fear of punishment be not continually present. But if there are those who cannot otherwise be persuaded it only remains to pursue the primitive plan.

(To be concluded.)

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at the premises in Tufton Street, Westminster, Mr. E. Guy Dawber, president, in the chair.

The PRESIDENT said they had lost a very old member, Mr. Zephaniah King, who joined in 1864; also Mr. Lancelot Simmons and Mr. Frank Whittingham. Votes of condolence were passed to the relatives of the deceased.

Mr. W. Kaula was elected a member.

House List 1906-7.

In the appointment of officers for the ensuing session Mr. R. S. Balfour has been nominated as president, Messrs. Walter Cave and A. Needham Wilson as vice-presidents.

Mr. A. W. SOAMES, M.P., contributed the following paper, but owing to the author's absence abroad it was read by the Secretary:—

The London Club House of Last Century.

"Man is said to be a sociable animal," says Addison in opening his "Essay on Clubs," and it seems indeed to have been the custom for men, and women also, to associate themselves together in clubs from a very early period of the history of the world. These clubs, however, in the early days usually partook more of the nature of religious or trade guilds than of the modern social club, although in ancient Rome instances of the purely social club are not wanting.

But, as far as I have been able to ascertain, the erection of buildings devoted exclusively to the use of a social club

Digitized by Google

in England does not go further back than about the middle of the eighteenth century. Before that date these clubs met in taverns or at coffee-houses, usually on fixed days, and they did not as a rule appear to have had any room or rooms reserved for their permanent exclusive use.

The earliest known club in London of the social type seems to have been the Bread Street, or Friday Street, Club, originated by Sir Walter Raleigh, which met at the Mermaid tavern; and among others which sprang up later may be named the Green Ribbon Club (1675), which apparently was the first to provide permanent headquarters for a political party at the King's Head tavern, at the south-west corner of Chancery Lane. In the course of the eighteenth century we find that White's was founded, or refounded, in 1730; the Cocoa Tree, 1746; Boodle's, 1762; Brooks's, 1764; and Arthur's, 1765. And these clubs, outgrowing the accommodation of coffee-houses or taverns, erected buildings for themselves. During the next half-century only two clubs—and those of a different character—the M.C.C. (1787) and the Smithfield (1798) were founded, and it was not until the year 1813 that clubs began to spring up in any numbers in London. Between 1813 and 1832 no less than fourteen clubs were founded:—The Guards, 1813; United Service or Senior, 1815; Portland, 1816; Travellers, 1819; United University and Union, 1822; Athenæum and Oriental, 1824; Junior, 1827; Wyndham, 1828; Oxford and Cambridge, 1830; Garrick, 1831; Carlton and City of London, 1832. Following these, we find in 1837 the Reform and Army and Navy (or Rag), and in 1840 the Conservative Club. This may be said to terminate the earlier period of club building, as in the next quarter of a century comparatively few new clubs were founded; and, indeed, the bulk of the newer clubs belong to the last twenty years of the century.

The evolution of the club house, as might be expected, reflects changes in our social habits. Two, at any rate, of the older club houses—the Athenæum and the United University—when built contained no smoking-room. It was not until 1857 that Thackeray succeeded in persuading the committee of the Athenæum to allow smoking on the premises. In the case of the United University it was found necessary to add a third floor in order to provide a smoking-room. This house, which was built by Wilkins, the architect of the National Gallery, has lately been pulled down, and a new club house is being erected on the site by Mr. R. T. Blomfield, A.R.A. In a remote corner of the Oxford and Cambridge Club may still be seen the row of pegs on which the few members who smoked in the early days of the club used to hang their coats, which they wore when indulging in that pleasant, but then unpopular, habit.

The greater facilities for travelling of the present day have also had their effect on the clubs. Not only have they increased in number, but also in size, and within the last few years it has become usual for clubs to provide bedrooms for members, which was only the case in a few of the old clubs, where perhaps a dozen might be found; while the modern political club, such as the National Liberal or the Constitutional, with its 108 bedrooms, is really more like a hotel than the old-fashioned club. Consequently we find that, whereas the Carlton and Conservative clubs have only one floor above the ground floor, the Constitutional runs into six storeys and 200,000*l.*, while the Travellers was built for the modest sum of 23,160*l.*, and the Athenæum cost no more than 34,239*l.* 2*s.* 6*d.*

Two circumstances may be noticed which had a considerable influence on the early clubs, the one beneficial and the other adverse. The removal of Carlton House, which faced the bottom of Waterloo Place, gave some excellent sites, now occupied by the Senior, Athenæum, Travellers, Reform, &c.; but, unfortunately, the period was one when exteriors were almost invariably rendered in stucco or cement, and this detracts seriously from the appearance of nearly all the older clubs.

The planning of a club house, of the earlier type at any rate, given a well-lighted and sufficient site, is not a very complex problem, and it is one that gives excellent opportunities to the architect. The hall and staircase naturally play an important part in the design, but with a few notable exceptions the designers of our club houses have not made the most of their opportunities in this respect. In many cases we find a spacious hall with an ample staircase, but the effect of the whole completely destroyed by the approach being at one side of the hall, and not opposite the staircase. A notable instance is the United Service Club. The hall is central and on a vast scale, occupying indeed a very large part of the site, and a central flight of stairs rises boldly, branching right and left and returning on both sides to the first floor. But the approach to this hall is by dodging out of a corner of the outer hall or lobby at one side of the staircase, with the result that there is no vista and the effect is absolutely lost. The same is very largely true of the other old service club, the Army and Navy (or Rag), which contains a large, florid staircase, similarly placed and planned, except that the central flight, instead of descending in an unbroken line to the ground floor, branches right and left shortly before reaching the ground, with a questionable effect. In the Conservative Club also the effect of a somewhat remarkable hall and staircase is diminished by a side approach in one corner of the hall.

As an example of how not to do it the Oriental may be cited. Here, again, we have an outer lobby, not particularly well designed, communicating near the corner again with a central hall which is little better than a well, and has a poor geometrical staircase.

The Union Club has also a geometrical staircase, but the approach is better and the space not so cramped. As, however, the main staircase ascends to the second floor, the well-like effect is not entirely avoided; and, indeed, there seems to be a good deal to be said for the plan adopted in many of the older houses of carrying the main stairs only up to the first floor, and reaching the second and upper floors, if any, by a subsidiary staircase.

At the Oxford and Cambridge Club an outer hall leads by thirteen steps into an inner hall, with stairs facing, but, as they are dog-legged and the return flight cuts in half the large windows on the half-landing, the effect is far from good.

The hall of the Junior United Service is entered through a small glazed lobby, probably an addition to the original scheme, and immediately opposite is a very broad flight of stairs, returning dog-legged both ways; but the effect is much marred by coarse and heavy detail, and the dog-legged flights are not happy.

At the Reform the hall, of the cortile type, is very successful, but the stairs are almost concealed, and hardly enter into the design at all.

The Conservative Club possesses a fine hall, to which allusion has already been made. It is square in plan, and the stairs ascend through an archway in the middle of one side; but the distinctive feature is a coved circular gallery at the first-floor level, with a domed glazed light above. This gives four rather awkward spandril-shaped soffits to the gallery, but the effect is striking and distinctly good, though one could have wished for rather more refined detail.

The treatment of the stairs in the National Liberal Club is somewhat unusual. The site is of an awkward shape, and it was no doubt a matter of difficulty to contrive a stately staircase for so lofty a building of so irregular a plan. The stairs ascend round an oval well, and the result is not particularly happy.

The most successful treatment of the hall and staircase is found in the Athenæum. The plan is both simple and effective. The site is a regular oblong, about 103 feet by 79 feet. This space is divided into three portions by walls parallel to the shorter sides, of which the middle part, occupied by the hall and stairs, is considerably the largest, and is roughly two-fifths of the whole. The entrance hall, which is only one storey in height, is divided by irregularly-spaced colonnades somewhat in the manner of a basilica, with a low segmental coffered ceiling over the nave and flat ceilings to the aisles. At the end of this hall, which is somewhat dimly lighted by windows alongside the main entrance, is seen a broad and lofty flight of stairs, branching right and left, and returning on both sides, the whole flooded with light from above. This plan of lighting is very pleasing and the effect of the whole is very good.

The lighting of large rooms 20 feet high or more is a matter of some little difficulty. The older architects for the most part frankly gave up any attempt to produce a window that would reach anywhere near the top of their rooms, and took refuge usually in a coved ceiling. As these clubs mostly occupy positions where there is a good light, and their rooms are not very wide, I am not sure that they were not right. Certainly the elevations gained in solidity and dignity by having sufficient wall space, where it is not frittered away or overloaded, and the attempt to use very large windows in the New University, Junior Constitutional, National Liberal Club, &c., is not so successful as to be likely to induce anyone to follow their example. In a few cases—*e.g.* Oxford and Cambridge and Junior Carlton—an additional height has been obtained by using round-headed

Digitized by Google

windows. In one case—the Rag—this difficulty has been met in another way. The ground-floor rooms have a window of ordinary dimensions, surmounted by an entablature carried on engaged, rusticated columns, and above this a sort of fanlight, square-headed externally, but arched on the interior. The result is not pleasing; externally it suggests an entresol, and I do not think the interior is any the better for them.

The majority of the large rooms are, of course, lighted from the side, but the coffee-room at the Oxford and Cambridge (65 feet 10 inches by 32 feet) is lighted by lofty windows at both ends, a method of lighting which does not give a pleasing effect.

Some of the earliest clubs—*e.g.* the Athenæum and United Service—have the ground floor very little raised above the street level, but it was a very usual practice in later houses to raise the ground floor a few feet higher, and get a fairly well-lighted mezzanine to provide lavatories and offices.

One of the principal objects of the designer of a club is, of course, to provide three or four rooms on a large scale which shall have some architectural character and look comfortable withal. I hold, then, that the ideal room for a club, whether it be coffee-room, drawing-room, library, or smoking-room, is one which provides a considerable number of nooks or recesses, where little coteries can assemble, or where a quiet table for reading or writing can be placed. Nothing gives an air of less comfort to a coffee-room than a bare space of straight wall with an interminable row of little tables set against it, all of the same size and shape. Therefore I would say to anyone who has the good fortune to design an important club house, break your room up boldly into bays, with columns and antæ of ample projection. An excellent instance of this is the library at the Travellers, the most charming room in any club in London. The dimensions are 65 feet by 22 feet 6 inches. The central bay is lighted by three grouped windows, and the end bays by one each. Slender coupled shafts stand well away from the antæ on pedestals connected to them, and some 7 feet or more from the side walls. The entablature is returned across the room over these shafts and the effect is most happy.

In Barry's later house, the Reform, we find a similar arrangement. Here the coffee-room and library are each about 117 feet by 27 feet and 20 feet high, and are divided again into three bays and recesses at each end. But here, instead of a single entablature crossing the room, he has separated his bays by two entablatures about 10 feet apart, with a soffite between at a lower level than the ceiling, and carried in the one room on single columns in antis and in the other on coupled shafts on pedestals standing boldly away from the walls. This arrangement gives additional nooks for small tables and somewhat disguises the excessive length of the room in proportion to the width. Both rooms are very successful, and the library is second only to that in the adjoining house.

The L-shaped room was not employed in any of the older houses, but it is not to be despised for a club. A more sociable method of entertaining strangers is to allow them the use of the smaller arm of such a room instead of relegating them to a badly lighted and stuffy little back room, as is so often their unhappy lot in the older and less spacious club houses. The Union has recently made an alteration to its coffee-room and adopted this plan, and two good examples of L-shaped rooms are to be found at the Junior Carlton.

Time will not permit me to give more than a few notes upon some of the more important club houses, and, indeed, an elaborate description of buildings whose appearance must be familiar to all would be a work of supererogation. Taken as a whole, I should put the Reform Club first in order of merit. The plan is very simple. The main building is a rectangle 120 feet by 105 feet, and in the interior is a covered courtyard, 56 feet by 51 feet, surrounded by a colonnade of Ionic pillars on unmoulded pedestals supporting a gallery, above which a Corinthian colonnade carries the roof. This arrangement gives a perfectly symmetrical, dignified and spacious interior, but the effect is a little marred by the interlacing cove lantern light, apparently of cast-iron. The use also of scagliola for the columns and wall surface is to be regretted.

This plan relegates the staircase to a very unimportant place in the design. It is entirely enclosed, and leads up through an arch opening in the middle of one of the shorter sides. The plans of the ground floor and first floor are almost identical. On the south there is on both floors a room about 117 feet by 27 feet; on the west one of 50 feet by 25 feet, plus a 7-feet recess; and on the north or entrance side and east or staircase side smaller rooms. As regards the exterior, the composition is of the simplest. The north and south elevations show three floors, each of nine windows equally spaced, and of one design for each floor, bound together by mouldings and enriched bands, broken only by a central door on the north, while the side elevation shows eight windows, with the four middle ones grouped rather closer together. A bold cornice and rusticated quoins complete the composition. The result of the simplicity of treatment and ample space of plain wall is to produce a building of which breadth and repose are the leading characteristics. It may be said by some that there is not enough window for our northern clime, but as no room in the club is more than 27 feet wide, they are, as a matter of fact, sufficiently lighted, and I, for one, am thankful that Barry kept his wall space as ample as it is.

Its neighbour, the Travellers, an earlier work of the same architect, has a frontage of 72 feet to Pall Mall, and a depth of 104 feet, with light only to the back and front. The architect has dealt with this by placing his entrance at the west end of the façade; from an outer hall a corridor, broken up into three bays and lighted by an open courtyard, leads to stairs on the left and the coffee-room beyond. This is well managed and gives a good vista, while the courtyard lights a small house dining-room on the other side, and there is a good morning-room to Pall Mall. Of the charming library on the first floor I have already spoken. The elevation to Pall Mall is very quiet, simple and well-proportioned, and in treatment much resembles its neighbour. But it suffers from being in stucco, and from the necessity of placing the entrance at one end. The elevation to Carlton House Terrace, with its three grouped round-headed windows, is not so successful, and does not merit the praise which has been bestowed upon it. It is said, with what truth I do not know, that the Pall Mall elevation was suggested by the Pandolfini Palace at Florence.

The Athenæum, by Decimus Burton, is, or was, another building simple and formal in character, but it has been ruined beyond redemption by the unfortunate addition of a third floor set back some 7 feet or 8 feet inside the main walls of the building. It surely should not have passed the wit of man to design a third floor without committing such an outrage upon an important building in one of the most prominent sites in London. The removal, too, of the balustrade surrounding the area can hardly be considered an improvement. The continuous balcony at the first-floor level is one of the rather unusual features of this building, and the small windows contrived in some of the panels under the balcony towards Pall Mall are certainly not happy. On the whole the exterior, though well proportioned and refined in feeling, leaves one rather cold.

The Oxford and Cambridge Club, by Robert and Sydney Smirke, was built in 1836-37, and cost no more than 26,743*l.*, though the frontage is about 90 feet and the L-shaped site is 130 feet in extreme depth, the whole of which however is not covered above the basement. It cannot be considered as particularly happy either in plan or elevation. The dog-legged stairs and end-lighted coffee-room have already been mentioned as not pleasing, but the other rooms are more satisfactory. The elevation is not particularly successful. Sculptured panels over the first-floor windows hardly succeed in concealing the fact that there is a vast height of wall above the windows, of which the use is not apparent, and the long, vertical lines which they introduce detract from the solidity of the whole.

The Conservative Club shows a symmetrical façade, with small wings of slight projection, the northern containing the entrance and the southern a large bay window. The ground storey is rusticated, and the central block has a detached Corinthian order above, and the whole is finished with a balustrade. It is a building of some dignity, and the front is one of the most successful. The plan gives a fine room to the front, and there is a spacious coffee-room behind.

The United Service Club occupies a fine site, and the main lines of the building are not bad, though not of any striking originality. Exception might be taken to some of the details, but the building has a massive air and is not inappropriate to a club of warriors.

The designer of the Junior United Service has not attempted any symmetry in his main elevation, but by boldly placing his main entrance out of the centre of the façade has secured a fine room with a large bay on the east. The impression, however, of the whole is one of heaviness

Digitized by Google

without dignity, and the end elevation to Regent Street, with its windows of varying heights and shapes, is particularly unfortunate.

The Army and Navy Club, by Parnell & Smith, was completed in 1851 at a cost of 54,000*l.* It owes some of its features to the Palazzo Rezzonico, on the Grand Canal in Venice, which was designed by Longhena in 1680, and owes its upper storey to Massuri sixty years later. The entrance in the side street enabled the architects to provide a fine room to Pall Mall, but the details of the interior are overflorid and not in the purest of style. The exterior is not unimposing, but one could have wished for a little more plain surface for the eye to rest upon.

The Carlton Club occupies a fine site with a light on three sides, like its neighbour the Reform, and the building is an elaborate one—a little too elaborate, in fact—and is open to the same criticism as the last. The surface is worried and cut up till there is hardly a square foot of plain surface to give repose to the eye. The polished granite columns, too, afford an unpleasing contrast to the stone, especially as the surface of the stonework is now unfortunately disintegrating badly.

The Junior Carlton is a building which has been completely remodelled. As originally designed by David Brandon, and opened in 1869, it showed a projecting portico, with the entrance at the east end and a corresponding bay at the western end. A few years later, however, the club acquired the site of the houses which then existed beyond it on the west, and the club was extended and entirely remodelled by Mr. Macvicar Anderson, and reopened in 1886. The entrance is now central, and the plan, which has been skilfully rearranged, gives spacious L-shaped rooms to the east both on the ground and first floors, and provides amply for all the needs of a large club. The elevations cannot be considered as satisfactory as the interior. They are wanting in style, and of no particular interest.

The Garrick is a club of modest dimensions. Though founded in 1831, the present building was not opened till 1864. It was designed by F. W. Marrable, and presents no very remarkable features in itself, though it contains an extremely interesting collection of pictures, mostly portraits of members and theatrical celebrities. The site is cramped and irregular at the back, and the architect was compelled to make his entrance out of the middle in order to get a good room to the front on the ground floor.

Of the huge buildings that have been more recently erected for political clubs, it is difficult to speak in terms of much commendation. The National Liberal Club has certainly more architectural character than the Constitutional or the Junior Constitutional, but, while fully admitting that the site was a difficult one, it is impossible to avoid feeling that more might have been made of it. The tower at the angle suggests either a back staircase or a chimney, or both, and a treatment of the angle might have been adopted which would have utilised it as a good and characteristic feature internally as well as externally, as witness the New Gaiety Theatre.

The change in scale between the windows of the lower and upper floors is so great as to be disagreeable, and if the lower windows had not been so vast the building would have gained much in breadth. If, however, it was considered absolutely necessary to keep them so large, more subdivision by mullions and transomes would have brought the large and small windows into better relation with one another.

The Constitutional Club occupies perhaps an even more awkward site, and it has not been successfully dealt with. Terra-cotta, too, is a poor material for a building on so large a scale, but a better material would not have redeemed it. The Junior Constitutional cannot, however, be said to suffer from a poor material, nor does the frontage to Piccadilly offer any difficulties, but a marble front will not carry off a poor design, and this one is quite wanting in breadth and dignity.

With regard to all these three, the question arises whether buildings so lofty and on so large a scale can be satisfactorily treated with gables. I am inclined to doubt it. More emphasis to the horizontal lines is, I think, required than can be obtained with such a treatment.

Before closing a somewhat rambling and discursive paper a word of thanks is due to the secretaries of the various clubs for their courtesy and kindness in affording me facilities for viewing the buildings and valuable information with regard to them—a courtesy which, I fear, is somewhat ill-requited by adverse criticisms upon some of the houses.

Mr. A. KEEN, who proposed a vote of thanks to the author of the paper, said he regretted they had not had illustrations of the buildings described. The designing of a club was a very great opportunity for an architect, and one that came very seldom to him. One always imagined, he said, that the committee of a club desired a dignified and refined building rather than one of a pretentious character. He thought they must all feel a certain amount of disappointment in some of the London clubs, which were often buildings with very little architectural merit, and dull and uninteresting to a degree beyond the fact that they were dignified and reposeful. The Reform, Travellers and Athenæum, all together in Pall Mall, were the only club houses that could be said to possess architectural composition. The Athenæum was at a disadvantage in stucco, but it was the fashion of the time, and the building was so well kept nowadays that they could pardon the fact. It was an example of good architecture, and there was a certain homeliness and picturesqueness about the building, which was enhanced by the paint and distemper with which it was treated externally. Mr. Soames had condemned the raising of the height of the building by the addition of an extra storey. They must all regret that this had been necessary, but since there was no alternative the speaker said he failed to see how it could have been better done, and he thought they were indebted to the architect for the reserve he had shown. In a Classical design it was always difficult to raise the building with any degree of success. They would all put the Reform Club first among all the club houses in London. It seemed to him to possess all the qualities of fine architectural design, fitness for its purpose, fine proportion, and, in a very especial way, it was distinguished by a fine proportion between voids and solids, and the whole effect was an extremely imposing composition. This was one instance of work showing merit, but he felt that in many of the other club houses the architects had not made the most of their opportunities, and he had an uneasy feeling that the chance would not occur again.

Mr. MATT GARBUTT seconded the vote of thanks.

Mr. H. P. G. MAULE said the paper had not done justice to the work of the modern architect. The older clubs were nearly all confined to large rooms, but in the modern requirements there was a striking contrast in the arrangement. The sites were cramped, and the elevations suffered, being enfeebled in breadth and dignity of treatment. The planning of the modern clubs generally was extremely fine.

The PRESIDENT, putting the vote of thanks to the meeting, said the author of the paper had not dealt with his subject from an architect's point of view, for he did not take into account the difficulties of to-day over those of the last century. In conclusion, he thanked Mr. Driver, the secretary, for reading the paper in the author's absence.

VALUATION OF THE METROPOLIS.

A RETURN has been prepared from the valuation lists sent to the County Council under statute, showing the total valuation of the administrative county of London, which, subject to appeals, will come into force on April 6, 1906. The totals of the lists are as follows:—

Gross value	£52,928,707 0 0
Rateable value	43,486,436 15 0
Assessable value, *i.e.* rateable value, reduced by one-half of the rateable value of agricultural land . .	43,477,771 15 0

The increases in valuation over the figures in force on April 6, 1905, shown by the return, are:—

Gross value . .	2,490,054 0 0	or 4·94 per cent.
Rateable value . .	1,829,370 7 6	,, 4·39 ,,
Assessable value .	1,830,461 17 6	,, 4·40 ,,

The largest increases have taken place in the City of Westminster (386,078*l.*), the City of London (253,015*l.*), St. Marylebone (160,664*l.*), and Wandsworth (135,625*l.*); and the smallest in Islington (5,029*l.*) and Stoke Newington (5,859*l.*); while in St. Pancras there is a decrease of 936*l.* The total increase in assessable value is less by 322,996*l.* than that at the last quinquennial valuation, at which, however, the increase was abnormally large.

A Fund has now been opened for the founding of a Chair of Architecture at the Durham College of Science.

NOTES AND COMMENTS.

WE have several times called attention to recent practice in the Courts by which both architects and engineers are held to be liable when claims are made on account of their manner of carrying out work. It is not sufficient to plead that they acted with their best judgment and according to the usual procedure. This week at the West Riding Assizes an important case was heard before Mr. Justice BIGHAM. Mr. JOHN RICHARDSON and Mr. G. B. HARTLEY, civil engineers, of Leeds, claimed 1,345*l.* 7*s.* from the Castleford Urban District Council, being balance of account for services rendered in connection with water and sewage works. The Council paid 600*l.* into Court, but counterclaimed 2,000*l.* for damages sustained in carrying out the work. The case occupied three days, and in the end the jury found for 550*l.* for the plaintiffs, in addition to the 600*l.* lodged. Besides the reduction of fees, the jury awarded to the Council 100*l.*, on the ground that there was negligence on the part of the plaintiffs. But the result might have been different if the case had been heard by an engineer as arbitrator.

THE Paris Opera House is supposed to exemplify advanced construction, and it is usually accepted by Parisians as being fireproof throughout. It is, however, remarkable that a wooden staircase exists in the building, and, what is still more surprising, it was intended to be used by the Emperor and the monarchs who visited him occasionally. A peculiarity of the building is that on one side there is a ramp by which carriages could ascend not only to a doorway, but inside the vestibule. A staircase led to the Imperial box, a special salon and other reserved apartments. In order to save time the staircase was made of wood; it was afterwards to be superseded by one of marble. But the war prevented the alteration, and the wooden staircase has therefore remained in its position for nearly forty years. The case was brought before the Municipal Council by one of the members, who considered it was a source of danger to the costly building. The officials in charge have always taken special precautions. The edifice will be made as secure as possible, but what is necessary is to have the staircase reconstructed in stone.

ILLUSTRATIONS.

CITY OF MANCHESTER NEW FIRE STATION.—A STUDY FOR THE HOSE TOWER.

THE important group of buildings facing London Road, Fairfield Street and Whitworth Street, Manchester, will, it is expected, be completed by the end of July. The area has been appropriated to the following purposes:—

	Square Yards.
Fire department	1,438
Bank	133
Coroner's court	288
Gas-meter testing department	937
Police department	617
Courtyard in centre of buildings for drill purposes, &c.	2,050
Total	5,463

Williams Deacon's Bank, Ltd., occupies a considerable portion of the ground floor on the front facing London Road. The need for a coroner's court has often been pointed out. The gas-meter testing department also fulfils a useful purpose, and has lofty and wide rooms wherein to do its work. The police station and the horse ambulances the city cannot dispense with. It will be evident that while the larger portion is assigned to the fire brigade, the needs of other departments of municipal work have been considered.

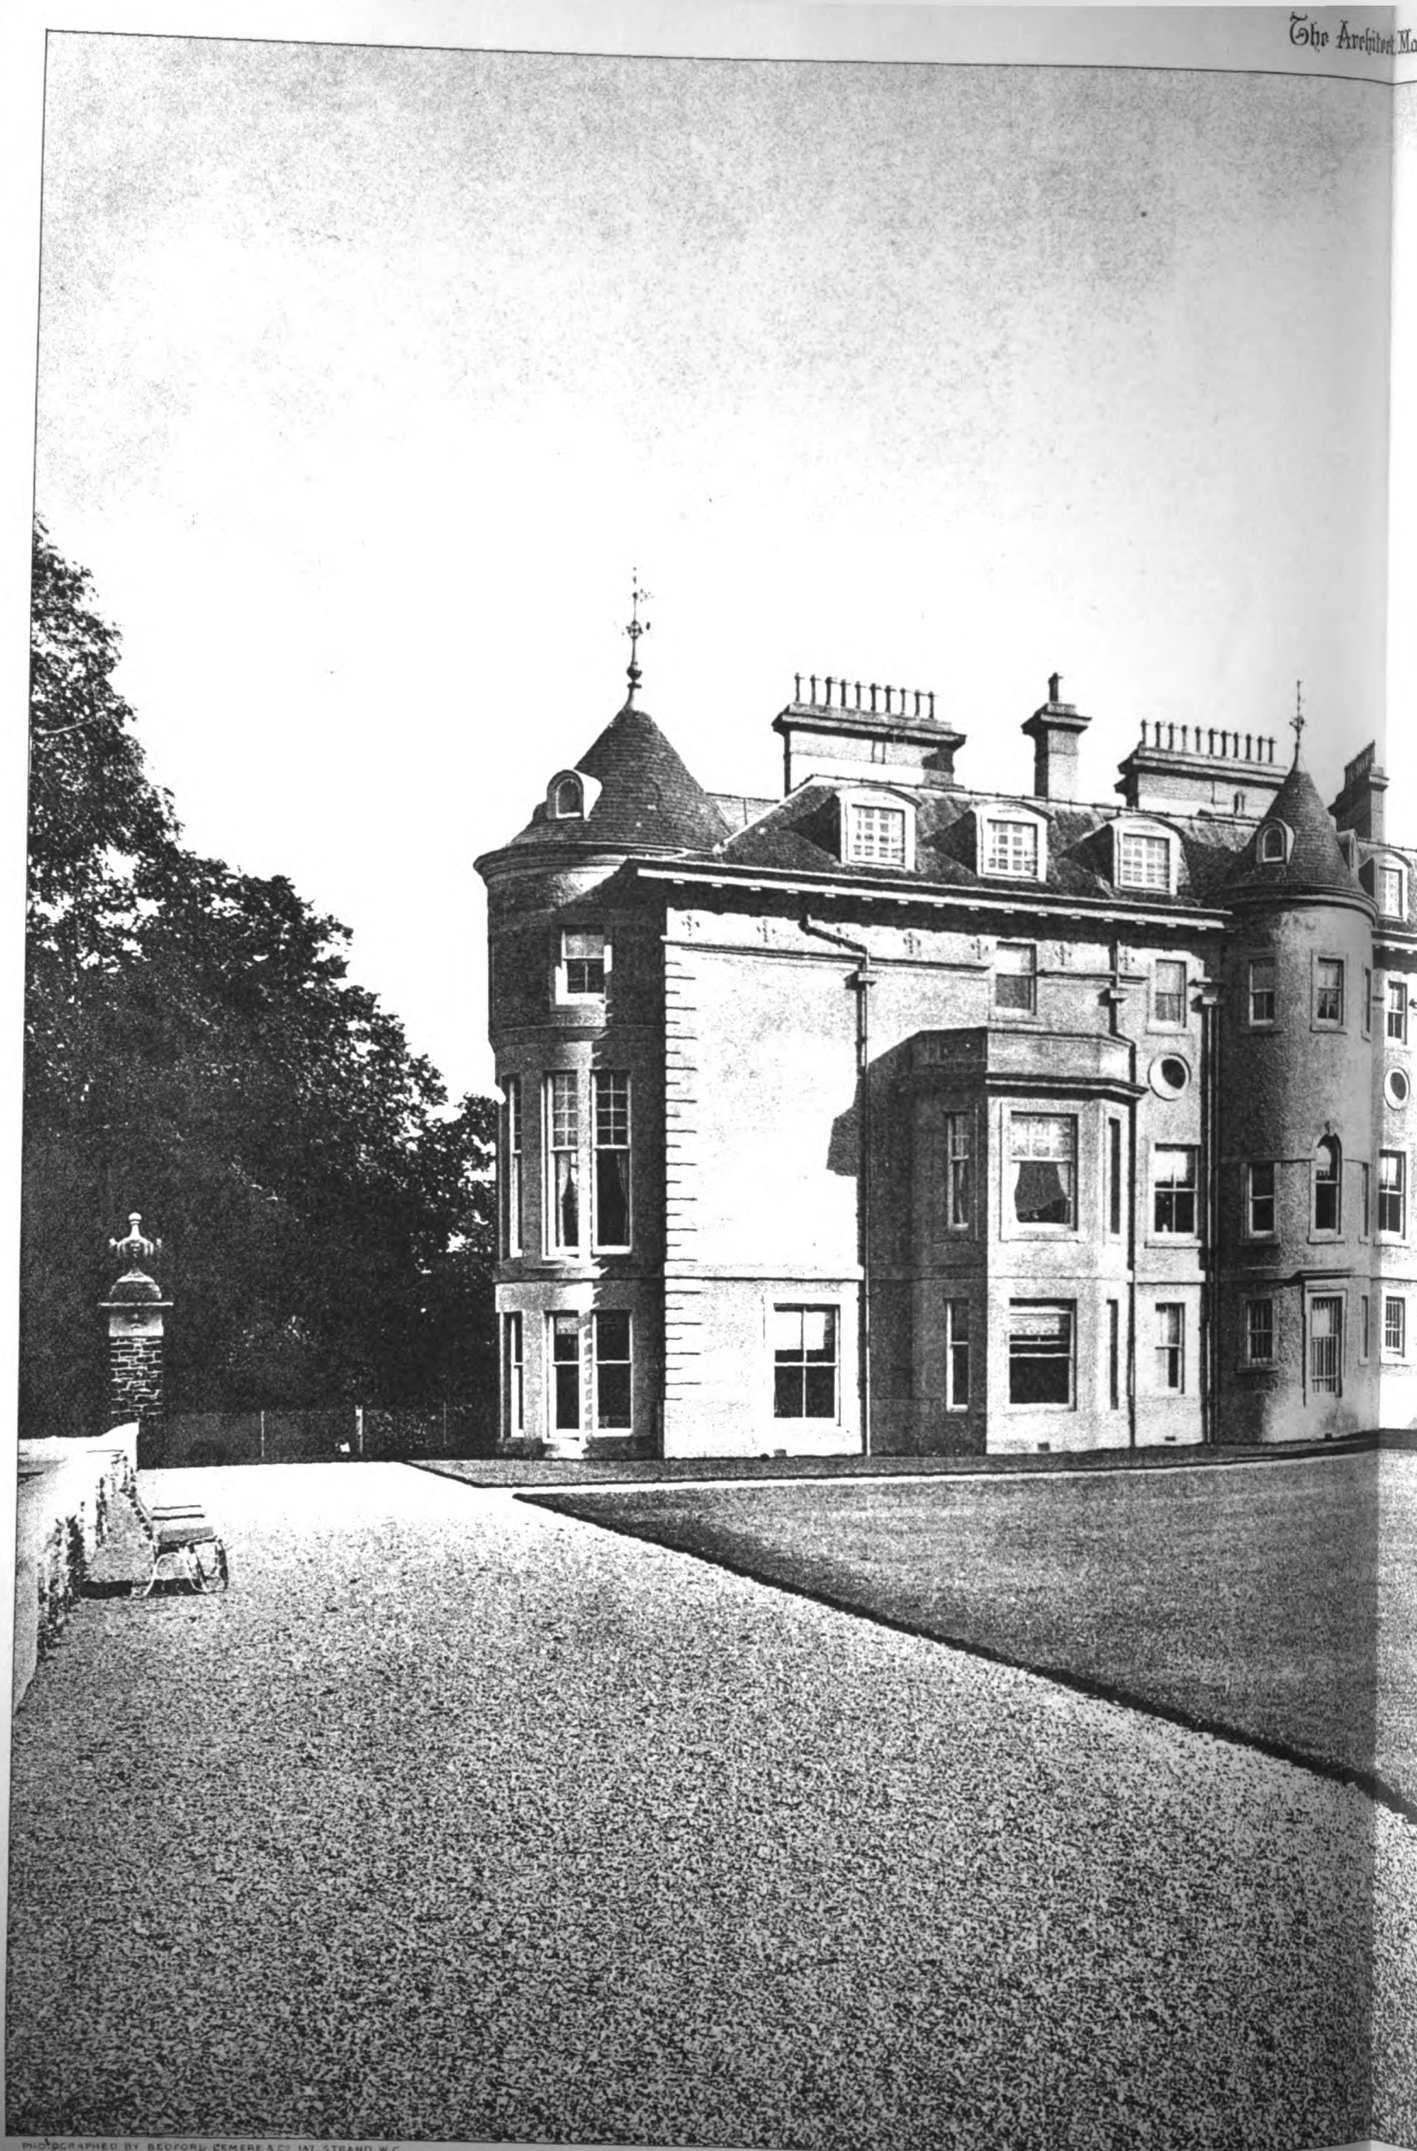
The fire brigade will occupy the whole of the building on the Fairfield Street side. There is accommodation for seven engines and twelve horses in the engine-house. There are seven bays for the seven engines. Each engine, when not in use, will stand facing the street, a gateway being provided for each. The men's quarters are above the engine-house, so that when the alarm is sounded in the night season this is what will happen:—An electric bell rings in the bedroom, which at the same time will be flooded with light. The man thus roused goes to the corner of his bedroom and slides down a pillar to the engine-house.

Over the engine-house also are the electrical operator's room, the office and living apartments of the chief officer (Mr. BAYLISS) and the hose tower. The hose tower is a prominent feature of the building, and is an essential part of a well-equipped fire station. It is used for the quick and economical drying of the hose after its use at a fire. Besides the room for the men, called the duty-room, there is on the Whitworth Street side a recreation-room. The basement affords the needful accommodation for the heating apparatus and a salvage store. On the Whitworth Street side are the mechanics' shops, smithy, paint shop and a spare stable. The entrance to the coroner's court will be from London Road. The gas-meter testing department is at the corner of London Road and Whitworth Street. It occupies more than 900 square yards of the ground area, with basement and two floors above. The police station is at the angle of Whitworth Street and Minshull Street, and has offices, seven cells, stabling for four horses, an ambulance house and six dwellings for police officers. The upper floors over the bank, coroner's court and gas-meter testing offices are to be used as dwellings for the firemen, accoutrement stores, gymnasium, laundry, hay and straw stores, and children's playground. Besides the chief, second and third officers' houses, there are thirty-six dwellings for the firemen.

In the buildings brick has been used throughout, with terra-cotta facings. The architects are Messrs. WOODHOUSE, WILLOUGHBY & LANGHAM, of Manchester. The cost of the land is set down at 25,000*l.*, the contract for the foundations at 7,720*l.*, and of the superstructure 75,000*l.*

VILLA CASTENHOLZ, INSEL OBERWERTH, COBLENZ.

A MONSTRANCE IN SILVER-GILT AND IVORY, FOR ARUNDEL CHURCH, SUSSEX.



THIS monstrance, which was designed by Mr. N. H. J. WESTLAKE, F.S.A., is intended for use in the church of St. Philip Neri at Arundel, and was a wedding present to his Grace the Duke of NORFOLK from the Catholics of British Isles. For the purpose of making some presentation and receiving subscriptions a committee was formed, and the Earl of DENBIGH kindly fulfilled the office of honorary treasurer. At the suggestion of his Grace, the present took the form described above. Mr. WESTLAKE was chosen to make the design, and Messrs. HARDMAN & POWELL to carry out the work. The monstrance is of solid silver, deeply gilt, excepting the angels supporting the central dish, which are of carved ivory. They are auxiliaries to the text inscribed on the monstrance, "Hic est panis qui de cœlo descendit." On either side of this centre, under canopies, are figures of St. JOHN THE BAPTIST, St. JOHN THE EVANGELIST, St. HENRY and St. CUNEGUNDA. On the base, in bassi-relievi, are busts of the four types of sacrifice, ABEL, ABRAHAM, MELCHIZEDEK and NOAH, with the witnesses of the Transfiguration, MOSES and ELIAS. The total height of the monstrance is about 42 inches, and its weight about 25 lbs. It is one of the largest and most important pieces of ecclesiastical plate in England, perhaps in Europe. The great monstrance of the cathedral of Cologne,* of the same type (fourteenth century), is 87 centimetres in height and not so elaborated.

FINLAYSTON, N.B.

* This is kept and shown in the Chapel of the Three Kings; it is illustrated and described in Dr. Franz Bock's "Das heilige Köln," pp. 13 to 17, plate x., fig. 39.

THE YEOMAN'S HOUSE IN ENGLAND.*

I SHALL not commence by making the customary apology for the imperfections of my paper, because I hope you will be so interested in my subject that such will be unnecessary. Before going further, however, I should like to take this opportunity of expressing my indebtedness to Mr. Batsford, the publisher of the series of volumes on old cottages and farmhouses, who has kindly lent me photographs, and to whose books I have freely referred.

Now, in speaking about architecture to-night, I want you to think of it not as a mere dry-as-dust antiquarian study of old buildings remotely connected with bygone ages, but as the outward expression of the thoughts and aspirations of our forefathers. It is so interwoven with the life and history of a people in all the great changes that nations underwent, that you will find its expression in the buildings of their time. In the Middle Ages and down to the eighteenth century architecture, or building as it is better called, was always influenced by local conditions, and the character of the work was much the same all over the country. It was really a product of evolution, growing out of the inherited knowledge of the wants the builders had to satisfy, and of the natural material at their disposal. The first need was shelter, or protection from the inclemency of the weather, and it was not until nations had arrived at a certain height of prosperity and opulence, and had leisure for the cultivation of the fine arts, that architecture, sculpture and painting can be said to exist. The original classes into which primitive mankind was divided were hunters, shepherds and agriculturists, and the buildings which each would require were characterised by their several occupations. The hunter and the fisher lived in the clefts of the caves and rocks, and the indolence which this state of life produced made them probably indifferent to greater comfort. The rock-cut temples of India and Egypt are based upon the cave dwellings. The shepherds or inhabitants of the plain, who roamed with their flocks from pasture to pasture, naturally required a species of dwelling that they could carry with them on their wanderings. This was doubtless the tent, the type of the architecture of China, whose people, like most of the Tartar races, were nomads or dwellers in tents.

Where a portion of the race fixed its abode for the purpose of agriculture, a different and more permanent dwelling was necessary. Solidity was required both for the personal comfort of the husbandman as well as for storing the fruits of the earth upon which he and his family subsisted. Hence we have the hut of which the Grecian temples are a type. From this rough subdivision we find that the first habitations of mankind required but little skill or knowledge, and merely satisfied the actual needs of the moment. It would, however, be impossible in the time at my disposal to trace the gradual evolution of the house from prehistoric times—though extremely interesting this belongs more to the domain of archæology. We know, however, that the earliest huts or dwellings in Great Britain were originally circular, built of wood interlaced with brushwood and covered with mud and straw, the top of the hut being probably thatched with reeds or such materials. The fire was in the centre of the floor, and light would be admitted through the door which served both as entrance and to let the smoke out. Many remains of these early buildings have been discovered near Glastonbury recently, and in Northern Italy and parts of Germany. At a later date houses were built of stone in imitation of these wooden ones. This single room was invariably open to the roof, and the next step towards comfort, if such it could be called, was to find an outlet for the pungent wood smoke. This led to a hole in the roof—the precursor of the chimney. In later times this opening developed into a tower or turret rising out of the roof, its sides fitted with sloping boards to break the wind, a method retained in use for many years, and which became an object of very considerable beauty in the external aspect of the building.

Up to the time of the sixteenth century it was common for the men and cattle to occupy one building, a custom that still prevails in Friesland, where all the large farmhouses shelter both the family and live stock alike. Indeed, a very large number of English farmhouses still exist in which the dwelling-home, barn and stables are combined under one and the same roof. In France to-day there are many of the old manor-houses that have changed in their customs but little since the Middle Ages, and where the labourers sleep in the stables over the stalls of cattle and horses, and there are many people in this country still living who remember how farmers' men-servants used to sleep on the hay in a gallery or loft over the cows.

The ordinary house was a very simple affair, consisting of one room, the general living and sleeping-room, with another called the "solar," either through it at one end on the same level or above it, and reached by a separate staircase. This central hall, or "house part," remained for years the principal apartment, for it was often the only room containing a fire, and down to the sixteenth century the men-servants and retainers generally slept there; indeed, "when night came, straw, rushes, heath or dried ferns were spread upon the floor, and those unprovided with beds or couches laid themselves down, each under the bench or table at which he sat." It was the keynote to the plans of houses, both great and small, in this country for centuries, and if we bear this fact in mind it is easy to trace the development of the plan through out the Middle Ages and down to the seventeenth century.

During this early period the community was more or less divided into two sections—the Church, as represented by the monasteries and abbeys, and the State by the kings, barons and nobility. Up to the Reformation, or Dissolution of the monasteries in Henry VIII.'s reign, most of the workers on the land were accommodated in convent buildings or beneath the roofs of the great landowners, whilst the numerous hospitals, or bede-houses, afforded shelter for a number more, and small individual houses were practically unknown, and such as were built have long since vanished. But when the change of ownership came at the Reformation an immense impetus was given to agriculture throughout the country, and the building of houses both great and small became a necessity, as all the former shelters and asylums had disappeared. Houses were no longer built for defence, surrounded by high walls and moats, and it is from this period (about 1550) that the greater part of the timber and stone houses and cottages in England were constructed.

Dealing with our special subject to-night—the Yeoman's House in England—we find that the architecture of the larger houses lies in a category somewhat by itself, and doubtless owes much to foreign influence and execution, so that it must be amongst the smaller and more homely buildings standing modestly by the wayside that we must look to find work conceived and carried out by native hands, and the period in which I think we shall find the most representative types will be in the years between 1580 and 1680. A yeoman as we understand it to-day was a freeholder, a man who owned and usually himself cultivated a small landed property, and thus had an interest and stake in the welfare of the country. The origin and progress of this class of the community is most interesting, but I have thought it better not to attempt to deal with it from the historical point of view, but to tell you about the houses that he lived in and the way he built them. We must recollect in those days houses were handed on from father to son and were often occupied for generations by the same families.

Perhaps we do not sufficiently realise that it is this old architecture that has made our country so picturesque and has added so largely to the quiet beauty of our villages and hamlets, for the forms and colours of old English cottages and farmhouses are almost always pleasing in themselves and in harmony with their surroundings.

Again, the geological formations of this country not only give a distinctive character to the districts which they compose, but also to the buildings themselves, and where we find the materials that nature provides used, there without doubt do we see the most beautiful architecture because it is the most appropriate.

The chief feature of building generally in the olden times was suitability to its purpose and the use that was invariably made of the local materials at hand. Sussex to-day, like its neighbouring counties, Kent and Surrey, is mainly devoted to agriculture, and though it no longer ranks as a manufacturing centre, it at one time contained the Birmingham of Mediæval England and carried on an enormous trade in iron. This trade increased rapidly throughout the Middle Ages, until in the sixteenth and seventeenth centuries the ironworks were of very great importance, for we read that in 1653 there were no less than twenty-seven separate furnaces in Sussex alone. It is indeed difficult to realise the busy human life that once peopled this sleepy district and to think that the guns which roared at the Armada and resounded at Edgehill were cast

* A paper by Mr. E. Guy Dawber, F.R.I.B.A., read at Carpenters' Hall on the 15th inst.

in Sussex. The entire Weald of Kent and Sussex was formerly covered with thick forests, and until their destruction for smelting the iron ore probably most houses were constructed chiefly of timber, and only the larger and more important ones of stone.

In Shropshire, Herefordshire and Cheshire, where large forests are known to have flourished, the timber buildings were brought to a state of perfection unrivalled in England, and all possessing their own special characteristics.

In the flint, chalk and brick districts of East Anglia we find the use of those materials produced a definite style eminently suitable for its purpose and typical of the country, and in the track of the great belt of oolite that stretches diagonally across the whole of England from the Somersetshire to the Yorkshire coasts the buildings are constructed entirely of the stone which lies everywhere within a few feet of the surface.

In the views that you will see to-night I shall endeavour to show you how much the materials of which the houses were built influenced their construction and design. Of course we must recollect that the builders had none of the difficulties to contend with that are ever present to-day. Drainage and sanitation were practically unknown as we

[From *Old Cottages and Farmhouses in the Cotswold District*, by W. Galsworthy Davie and E. Guy Dawber. B. T. Batsford, Publisher.]

understand them; water-supply and the consequent introduction of pipes inside the house, together with the complications of modern requirements, were non-existent, so that when examined in detail they are found to be simple, both in plan and arrangement. The houses were mostly placed in such positions as would shelter them from exposure to the weather, and give ready access to such roads as then existed. This, however, was by no means always the case. Apparently no attention was paid to the question of aspect or as to whether the position commanded good views. I have selected a few typical houses from different parts of the country showing the positions we find them in to-day. No doubt a great deal of the charm of these old houses is due to the fact that they were nearly always self-contained, for the first thing that strikes us is the absolute simplicity of the plans. The bulk of the larger ones have now been converted into two or more separate dwellings, and though many of these later alterations appear at the first glance to have changed the original plan, it is easy to reconstruct it. As single houses they consisted of two or three rooms on the ground floor, with one, the living room, generally larger than the others—the most usual plan being practically a continuation of the old Mediæval one, an oblong living or common room in the centre with offices or chambers at either end or forming wings; sometimes the wing was built at one end only, but more frequently the plan was symmetrical. A beautiful, though much mutilated example, still remains in the manor-house at Pattenden, Kent, which dates from the early part of the sixteenth century, having been built for the standard-bearer of Henry VIII.

Beyond the actual rooms themselves there was nothing; no store cupboards or conveniences of any kind, and everything was contained within the four outer walls. One sometimes wonders what these sturdy old yeomen would have thought of our modern craze for putting baths in cottages. It rather reminds me of the dear old lady who had one of these luxuries, and when I asked if she liked it said "she thanked God she had never had occasion to use it yet," and her near neighbour who, in answer to my similar question, said "she found it a most excellent place to keep the hens in." The smaller houses generally had but one outer door, but as they grew in size and importance two, and sometimes three doors were not unusual, and it is only since these houses have been converted into cottages that other doors and windows have been inserted such as were never found in the original buildings. In the farmhouse at Rissington in Oxfordshire this was clearly seen.

The houses were always planned one room in thickness so that they could be roofed in in a single span, and so avoid any complications with internal lead gutters and flats. When more accommodation was needed they were at first lengthened, then made L, E, or H shaped, with a central block and projecting wings, but however large the house, always retaining the single span roof; you will notice how much this limitation had to do with the design and appearance of these buildings. The stairs generally ascended in the middle of the house directly from one or other of the living rooms and frequently by the fireplace, and contained in as small a space as possible. They were often circular in plan, and in some of the oldest houses are in stone with a central post or newel similar to those in a church tower—an instance of the manner in which old traditions lingered in country places. Oak was the other material used with a series of winders round a centre post, and generally cramped and awkward to get up and down. Sometimes

these staircases were in turrets projecting from the main building, finished at the top with a conical roof, as in the farm at Hotst, in Normandy, and the château of St. Hippolyte at Canopville. Until a few years ago there was a beautiful example at Burford, in Oxfordshire, but this unfortunately has been pulled down.

The two great features of domestic architecture, more particularly in a climate like our own, are the roof and the fireplace —they represent the abstract ideas of shelter and warmth, and whether in the castle or cottage have always been given due prominence in every English home. The fireplace was the spot around which the family would cluster after the day's work in the fields or at the loom was done, and where the meals were cooked. Most of the fireplaces, those in the living rooms especially, were very large, frequently 6 feet and upwards in width; they were not high—some 4 or 5 feet—with the head formed either of stone (as at Plas Mawr, in Conway, and Boswick Hall, in Westmoreland), or spanned with a plain lintel of oak or arched in bricks. Wood was the usual fuel burnt on the hearth, and pots and kettles were hung from the hinged iron trivets fixed on one of the innermost angles. When the fireplaces were large, on one or both sides seats were often arranged just wide enough for a person to sit down comfortably. Some few inches up on each side there were places hollowed out to take the elbows, or else to stand a cup or mug on. Sometimes cupboards were fitted in, and occasionally there are small windows to light the ingle. Though their close proximity to the fire has its obvious drawbacks, yet these warm seats are much coveted corners, and in the village inns to-day in the West of England you can often see the old labourers putting up willingly with smarting eyes and general discomfort rather than shift their places. The bread oven in which the faggots were burned generally opened out of one side of the fireplace, sometimes built in the thickness of the wall or else jutting out in the form of a semicircle with a small roof over it, as at Snowshill, which is a very typical plan of a small self-contained house. The chimneys are quite one of the most important elements in the external effect of many of the houses. The liberal use of materials in their construction, the simple yet bold way in which they spring in rich clustering shafts from the ridges or gable ends, is always an attractive feature, and one that greatly enhances their beauty, as you will notice in the very beautiful house near Godalming. The variety of plan adopted is almost endless, and the utmost ingenuity seems to have been exerted in their arrangement. They are placed generally at either end of the building, or they rise in a mass from the centre of the roof and as if the old builders disliked too much uniformity. When the letter plan is adopted we notice various projections and settings forward, many without apparent reason except the love of novelty and change, as at Easebourne, near Midhurst.

In those parts of Sussex and Kent where stone was quarried many of the cottages were built of it, but here, as in other districts of England, the builders were confronted with the difficulty of carrying up the stacks above the roof line in stone. The nature of the stone was such that it did not lend itself to the customary separate shafts, such as are seen throughout the Cotswold and Northampton districts, formed of thin slabs set on edge one over the other. To build them in the ordinary stone walling would have made them too cumbrous and bulky, so before leaving the roof the stone was abandoned and brick unreservedly used as a substitute. Hence we frequently see in this part of the country the pleasing combination of the base of the stack, which generally projects from the face of the wall, being of stone, and the shafts above being in brick, as at Eashing Park, Ford Mill, near Wrotham, Penshurst, Wickhambreaux, and Bean Lodge Farm, near Petworth, and Craven Arms. Now, in the stone districts the chimneys were always placed centrally over the ridge or on the apex of the gables at either end (as at Broadway), or when the stacks were at the side of the building then on smaller roofs connecting them with the main one. The base of the chimney was invariably square until it cleared the roof, then the flues were built separately, either square or diagonally, in clusters of two, three or four, always made of slabs of stone (as at Medford House in Gloucestershire), about 3 or 4 inches thick and 8 or 10 inches deep, standing on edge and breaking joint over each other, and tied together at the top by a moulded cap of some simple section, as at the court-house at Painswick in Gloucestershire. The ingenious way in which these chimneys were managed, whether of stone or plain unmoulded bricks, always excites a feeling of admiration, for, simple as they are, they possess a breadth and sense of proportion sadly lacking in cottage chimneys of the present day.

COTTAGES AT SWANTON STREET, KENT.

[From *Old Cottages in Kent and Sussex*, by W. Galsworthy Davie and E. Guy Dawber. B. T. Batsford, Publisher.]

It was, however, in the arrangement of the roofs that these old builders excelled, always bold in outline, simple in plan and arrangement, and generally unbroken in their surface and treatment; they shelter the whole house and convey at once a kindly feeling of homeliness.

In the tiled roofs of Kent and Surrey hips perhaps are more frequently met with than gables, and hardly a roof seems complete without them, but directly we get into the districts where stone walling and mullioned windows are used gables are more noticeable.

Now, if we analyse any of these roofs in order to discover what constitutes their charm, we find that they resolve themselves into very simple forms, but the masterly way in which in almost every instance the grouping and disposal of the gables, chimneys and dormers was managed is worthy of our admiration. Dealing first with the stone buildings, the roofs were nearly always treated in the same way, having a slope of about 55 degs., and being hung with stone slates (the only material available), graduated in thickness and size from the eaves to the ridge, and crowned on the top with a stone cresting. In the one example from Painswick you will see how these stone slates are used. There we see the effect of material upon design and construction, and how these builders realised that one was dependent on the other. The nature of the stone of which the slates are made—in the Cotswolds at any rate—limits them to certain sizes, so that the stone roofs of flatter pitch covered with large and heavy slates found in Sussex and the North of England are quite unknown here.

Now, if the angle of the roofs was flattened the slates would have to be larger, otherwise they would not keep the wet out, so after finding the pitch at which they had least strain on the pins and were most weatherproof, the old slaters never varied it. The valleys are formed of the same slates, in a wide sweep with no hard line of demarcation where the roofs intersect, all laid in regular formation and ranging with the ordinary slating, as shown in Callowell Farm, near Stroud. Owing, doubtless, to the difficulty of getting lead in these country villages, the builders did without it, and their houses, as mentioned before, were always roofed in a single span, and no lead gutters or flats were needed. Hips or any cutting or mitreing of the slates were absolutely unknown in a genuine stone-roofed house, and we therefore find invariably the gables with the slates carried out over them, as at Back Edge, in Gloucestershire, or finished with a coping, as in Moor Hall, Stroud.

The old craftsmen could do almost anything with their stone slates; the clever way in which the outside overs were roofed, or over the circular outside staircases with pointed roofs, and again in the beautiful dovecots, of which so many still remain scattered about the country, is truly remarkable. The dovecot from near Cirencester is a very typical example.

In Cheshire and Lancashire and Yorkshire, and parts of Sussex and Somersetshire, where the stone slates are very large and heavy, the pitch of the roof is flattened, for you will realise it would be impossible to cover with heavy stone slates steeply sloping slides, where all the drag and strain would be on the pegs and laths (examples are given from Billingshurst, Sussex, and Corfe in Dorsetshire, and Alderley Edge in Cheshire). Doubtless some of the roofs of the houses in the south-east of England which are now covered with red tiles and have such a beautiful effect were once hung with stone, as many of the buildings are of earlier date than the roofs.

(To be concluded.)

TURNER DRAWINGS AND PAINTINGS.

ACCORDING to the report of the trustees of the National Gallery there have remained in their custody many thousands of drawings, forming part of the "Turner Bequest," which have been kept in eleven tin boxes in precisely the same state as that in which they were left by Mr. Ruskin after he had, with the approval of the National Gallery Board, selected a large number of examples for exhibition.

Early in the year these drawings underwent a specially careful examination by Mr. A. J. Finberg in the presence of the Keeper. They were disposed in about 300 parcels and classified by Mr. Ruskin in accordance with his theory of artistic value, 108 parcels being described as "entire rubbish," 124 as of "middling value," and 71 as "right in intention." For the purposes of this arrangement, and with the view of providing the best examples for exhibition, over 150 of the sketch-books, each consisting on an average of 100 pages, had been dismembered and the leaves separated.

This arrangement was not, however, found to be of any service for purposes of reference, and as Mr. Finberg's private researches showed that sufficient evidence existed for determining with considerable accuracy the chronological order of the drawings, the trustees, who had for a long time past been anxious to make more effective use of these sketches, felt that the opportunity should not be lost of engaging Mr. Finberg's services for a work which could not possibly be carried out by the staff of the Gallery unaided.

It was decided to undertake a chronological and descriptive inventory of all the unexhibited Turner sketches, and, after taking a record of Mr. Ruskin's classification by preference, to arrange the drawings in chronological order in cabinets designed for the purpose. It was found, after a month's trial, that, in order to make this rearrangement of the drawings of the greatest permanent value, it would be necessary to include in the proposed inventory the whole collection of exhibited and lent drawings belonging to the Turner Bequest, drawings which had never been systematically dated, and of which many had been wrongly described. This work, which is difficult and laborious, has already made substantial progress.

The Turner collection of paintings, placed in the custody of the National Gallery Trustees on September 25, 1856, contained, besides the pictures since hung in public exhibition rooms or in the official rooms at Trafalgar Square, or lent under the Loan Act of 1883 to provincial museums, a certain number of paintings which, on account of their unfinished or wrecked condition, it has never been thought possible to exhibit.

A more careful examination has lately led the Trustees to believe that some at least of these paintings may now be framed and take their place in the general collection. A selection has been made for this purpose, and of the paintings selected, at present twenty-two in number, many have been relined and all are in course of being surface cleaned and varnished. The following three paintings have been completed and framed, and will shortly be hung, with other examples by Turner, hitherto only shown to visitors on application, at the National Gallery of British Art:—No. 1,980, *Storm on a Rocky Coast*; No. 1,981, *Norham Castle*; No. 1,984, *Margate from the Sea*. The remaining paintings will be cleaned, framed and added to the above list as soon as possible.

TAYLOR ART SCHOLARSHIP.

THE forty-seventh annual adjudication for the Taylor Art Scholarship for Irish students was held in Dublin, when the sum of 115*l.*, arising out of Captain Taylor's bequest, was awarded in a scholarship of 50*l.*, two prizes of 15*l.* each, two prizes of 10*l.* each, and a prize of 5*l.* in classes one, two and three, and also a special prize of 10*l.* for an optional work. The judges were Mr. Nathaniel Hone, R.H.A., appointed by the Royal Dublin Society; Sir Walter Armstrong, appointed by the Governors of the National Gallery of Ireland; Mr. Nassau Blair Browne, R.H.A., appointed by the Royal Hibernian Academy. Candidates for the scholarship and prizes were required to submit for examination a work in one of the following classes:—

Class 1, for painters—A composition or subject picture in oil or water-colour, size not larger than 36 by 28 inches, and not smaller than 24 by 16 inches. The subjects for 1906 were, for figure painters, "The Toilet," and for landscape painters, "A Windy Day."

Class 2, for modellers — A statuette not exceeding 36 inches in extreme height, illustrating a given subject. The subject for 1906 was "A Dancer." They were also required to submit a study of a head, life-size, in basso-relievo.

Class 3, water-colours—A prize not exceeding 10*l.* was offered for a work in water-colour, and the subjects were, "A Landscape," "A Garden at Evening," and, figure painters, "A Serenade."

Class 4, optional work—A special prize not exceeding 10*l.* was also offered for competition, the selection of the subject in art being left entirely open to the competitor.

Twenty-four works in all were submitted in competition, and the judges unanimously recommended the following awards:—

The scholarship of 50*l.* to work No. 3, entitled "The Toilet," executed by Wm. J. Leech, a student of Concarneau, Finisterre, France; a prize of 15*l.* was awarded to work No. 17, entitled "The Toilet," executed by Miss E. M.

Digitized by Google

Le Poer Trench, a student of the Royal Academy schools, London; and a prize of 15*l.* was awarded to work No. 21, a statuette, entitled "A Dancer," executed by Albert G. Power, a student in the Dublin Metropolitan School of Art; a prize of 10*l.* was awarded to work No. 4, entitled "The Toilet," executed by Miss Dorothy Moss Elvery, a student of the Royal Hibernian Academy; a prize of 10*l.* was awarded to the work No. 18, entitled "A Garden at Evening," executed by Miss Florence J. Gillespie, a student of the Metropolitan School of Art, Dublin; and the prize of 10*l.* for an optional work, entitled "Portrait Study of a Head," was awarded to Miss Mary Swanzy, a student at Miss Manning's school, Merrion Row, Dublin; a special prize of 5*l.* was awarded to work No. 15, entitled "The Toilet," executed by Maddison B. Fisher, a student of the Royal Academy, London.

SOCIETY OF ARCHITECTS.

ON Saturday, March 24, the members of the Council of the Society of Architects assembled at the Guildhall, where they were met by Mr. Alexander Ritchie, J.P., the chairman of the city lands committee and other members of the Corporation of London, and conducted over the historic building, being afterwards entertained to luncheon by Mr. Ritchie. Subsequently the visitors and their hosts adjourned to the new sessions house, where they were joined by a large party of members of the Society and their friends, including a number of ladies, who, by the kind permission of the City authorities, were enabled to view the buildings under the best possible conditions. Among those present were the president, Mr. Albert E. Pridmore, C.C.; Mr. R. F. Vallance and Mr. G. A. T. Middleton, vice-presidents; Mr. Ellis Marsland, hon. secretary; Mr. C. McArthur Butler, secretary; and some hundred and fifty members, on whose behalf a very hearty vote of thanks was accorded to Mr. Ritchie and the Corporation of London for the permission and facilities afforded them of seeing so interesting an example of modern architecture.

SHEFFIELD SOCIETY OF ARCHITECTS.

A PAPER was read by Mr. H. L. Paterson at the last meeting of the Sheffield Society of Architects and Surveyors on "English Renaissance, 1750 to 1800." The lecturer said that this period was considered by some to be the closing one of the Renaissance, and by others the commencement of strictly modern architecture. It had been vigorously denounced by the leaders of the Gothic revival last century, and it was almost universally held to be the period of the Renaissance least worthy of study. There was, however, no doubt about the high estimation in which it was held at the time; architects and public were agreed in regarding it as the greatest architectural age since the days of Imperial Rome. The principles of that architecture as interpreted by Palladio and others were considered binding for all time, and no further development was desirable. Mediæval architecture was almost ignored, although Chambers expressed great admiration for it, without, however, taking any steps to revive it. Chambers was the most cultured exponent of the style and the most worthy of study, but his violent prejudice against Greek detracted somewhat from the value of his counsels.

The latter half of the eighteenth century was a period of great national prosperity, in spite of the wars and revolutions that involved nearly the whole of Europe. Many of our finest mansions were erected or remodelled, and much of the work was in the hands of a small number of architects. The order was essentially the basis of design in this period, and dominated not only the elevations, but the plans. To obtain a dignified external order people were willing to sacrifice internal convenience. The type of house which had already been developed, and of which Castle Howard, Fonthill and others were examples, gave place towards the end of the century to the self-contained plan of the Brothers Adam and others. Slides were shown illustrative of the different types. The treatment of interiors was next touched upon and the introduction of the Adams style of decoration illustrated.

One of the main features of this period was the great attention paid to street design, notably in the West End of London, in Edinburgh and in Bath. In Bath the development of the city, which had been largely in the hands of Wood, sen., was continued by his son. The works of Wood, jun., were then illustrated by slides which had kindly been placed at the disposal of the lecturer by Mr. Mowbray A. Green, the author of "The Eighteenth-Century Architecture of Bath." The architecture of the new town of Edinburgh was also illustrated, and it was stated that both in the planning of the city as well as in the style of architecture, Edinburgh and Bath had much in common.

The treatment of gardens was referred to, and it was stated that the landscape garden had almost entirely taken the place of the old formal garden, and that a great feature was made of the casinos, temples and ornamental bridges. At the close of the century the Greek influence was making itself felt in design, and soon outstripped in popularity the eighteenth-century style. The style of Chambers, however, continued to be used throughout the whole of the Greek revival, and even through the Gothic revival down to the present time. The lecturer concluded by claiming for the later Renaissance style generally an adaptability to almost all classes of buildings, and pointed out that whatever was the fashion in architecture, this style never lost its charm, if reasonably handled, and that it was the architecture of the greater part of the civilised world.

CHARLES MERYON.

WITHIN the past few days there has changed hands in London for the phenomenally high price of 420 guineas one of the etchings of Charles Meryon, the master of the needle who died at Charenton early in 1868, and was buried in the cemetery of the asylum. No Whistler etching even has come anywhere near that sum. The unique dry-point study "My Mother" by the butterfly genius was privately sold a year or two ago to Mr. Freer, of Detroit, for about 200*l.*, and at auction the "Ross Winans" has made as much as 136*l.* From time to time there has been a good deal of discussion as to Meryon's family, but there can be no doubt, says the *Sussex Daily News*, that his father was Charles Lewis Meryon, of Rye, who belonged to an old Huguenot stock. Dr. Meryon, of Rye, was educated at the Merchant Taylors' school and afterwards studied medicine at St. Thomas's under Henry Cline, upon whose recommendation he was, in 1810, engaged to accompany the eccentric Lady Hester Stanhope on a voyage to Syria and the East in the capacity of medical attendant. Meryon has described with the utmost minuteness Lady Hester's complicated oriental environment, her tyranny, her interminable conversation and cross-questionings, of which he was often a victim. In the third volume of the "Memoirs" is a portrait of Dr. Meryon in Bedouin dress.

Charles Meryon, the great etcher, was born in Paris in 1821, the year that the doctor was admitted to Fellowship of the College of Physicians. His mother, Pierre Narcisse Chaspoux, was a dancer at the Paris Opera House. All the artist's biographers accept the now admitted paternity of the Sussex doctor. That being so it is interesting to recall that Dr. Meryon's father, Mr. Lewis Meryon, of Rye, published about 1810 a description in verse of the contents of a stationer's shop, so that a certain amount of artistic impulse came to him from that direction. Charles went to school at Passy, was afterwards taken by his mother to the South of France, in 1837 went to the naval school at Brest, and two years later went to sea. In all he produced about 100 etched plates, of which the famous Paris set of 1851-4 is far and away the most important. He sold his etchings often for very small sums, and by 1858 the mental disease which for long had threatened became acute, but lifted again on coming in intimate contact only with a few people. It appears that his father and a maternal aunt and a cousin, Dr. Meryon, did all in their power to supply wants which the artist could be brought to confess. No doubt because of his English ancestry, there were presented to the British Museum in 1904 over 200 of his pencil drawings belonging to his sailor period, the mid-1840's.

Our immediate concern is to point out the great rise in the money value of the finest of Meryon's etchings. His masterpiece is "L'Abside de Notre-Dame de Paris," a view of the great church from the Pont de la Tournelle, with on the left the Pont aux Choux and the Hôtel Dieu. There is no modern etching more nobly planned, more exquisitely lighted, more tender and radiant and imaginatively just. Only about ten or twelve impressions of the plates in the first state, before any letters, are known. One of these was sold by Meryon for 1.50 franc (1*s.* 3*d.*), as an existing receipt testifies. That same proof changed hands in the 1890's for 125*l.* Burty, one of his firm supporters who owned a collec-

Digitized by Google

tion that would now be priceless, and compiled a catalogue of the etchings, mentions two trial proofs of the wonderful "Abside." One of these, on light green paper, which, if we mistake not, had belonged to Sir Seymour Haden, was in Bond Street in 1902, when it was sold for 300*l.*, then regarded as a preposterous figure. But time has proved that the valuation was a moderate one. An excellent first state, with Meryon's inscription to M. Charles Bradier, has recently emerged from a home collection, only to pass into another for 441*l.* America was keen to buy, but the cable came too late.

Other famous plates by Meryon, who has not ineptly been called the Chopin of the needle, are "La Galerie de Notre-Dame," a vision of sunlit pillars in the mother church at Paris, a second state of which has fetched 56 guineas at auction; the grim view of "La Morgue," second state, 86 guineas; the view of the portico of St. Etienne du Mont, 58 guineas; the "Pont au Change," which underwent so many alterations, 50 guineas; and "La Pompe de Notre-Dame," showing the fretted roof of the cathedral and the timbers of the engine-house, 40 guineas. Most wonderful of all in many respects is "Le Stryge," the monster that dominates the tower of St. Jacques. The etching has an inscription in Gothic letters :—

Insatiable Vampire, l'éternelle Luxure
Sur la Grande Cité convoite sa pâture.

The monster typifies the agony which assailed Meryon's inward being. He said :—"The monster is mine . . .; he means stupidity, cruelty, lust, hypocrisy; they have all met in that beast." It is a terribly explicit vision of the vampire brooding with gluttonous greed over "La Ville Lumière." The "Abside" is the other more enduring aspect of the city's spiritual life. In a Scottish collection are many of the exquisite original drawings made for the etchings.

ROYAL SCOTTISH ACADEMY.

WE mentioned last week that at a general assembly of the Royal Scottish Academy three Associates were elected, viz. :—Painter, Mr. R. M. G. Coventry, Glasgow; sculptor, Mr. Percy Portsmouth, Edinburgh; and architect, Mr. James Miller, Glasgow.

According to the *Scotsman* the voting for the painter Associate was :—First vote—Coventry, 13; G. Stratton-Ferrier, 5; Skeoch Cumming, 4; W. M. Frazer, 3; Fiddes Watt, 3; George Smith, 2; John Lochhead, 2; Peter Wishart, 2.

In the second vote the numbers were :—Coventry, 34; Stratton-Ferrier, 9; Cumming, 4; Frazer, 4; Watt, 3; Smith, 3; Lochhead, 3; Wishart, 2; and David Gauld, Glasgow, 2. Votes were also recorded for James Riddel, P. Downie, Glasgow; Whitelaw Hamilton, J. A Ford, Duddingston Herdman, Graham Glen, Robert Hope, Marshal Brown and A. Kay, Glasgow.

The voting for the sculptor was :—First vote—Portsmouth, 24; H. S. Gamley, Edinburgh, 17; Kellock Brown, Glasgow, 6; W. Hubert Paton, Edinburgh, 5. The second vote was—Portsmouth, 17; Gamley, 16; Brown, 6. Final vote—Portsmouth, 24; Gamley, 19.

For the architect the voting was :—First vote—Miller, 11; Keppie, Glasgow, 11; Campbell, Glasgow, 8; MacIntyre Henry, Edinburgh, 7; T. D. Rhind, Edinburgh, 5; Tarbolton, Edinburgh, 4; Hunter Crawford, Edinburgh, 4; and James Dunn, Edinburgh, 2. The second vote was—Miller, 20; Keppie, 9; Campbell, 10; Henry, 11. The third vote was—Miller, 24; Campbell, 10; Henry, 13. The final vote was—Miller, 29; Henry, 13.

The following biographies are given :—Born in Bridgeton, Mr. R. M. G. Coventry comes of a Glasgow family, and spent his early days in the not very artistic surroundings of mills and factories. As a lad he was apprenticed as a designer, but commerce had for him no attractions, and when only sixteen years of age he was already struggling for recognition in the world of art. At the age mentioned he began to contribute both landscape and figure subjects to the Glasgow Institute, the exhibitions of which were then held in the Corporation Galleries. He was also a student of the Glasgow School of Art. By the time he reached the age of twenty-one he had quitted office work and set out boldly on his artistic career. About twenty years ago he went to Paris, where he studied under Bouguereau and Fleury, and on his return to Scotland he became a regular contributor to the Glasgow Institute, and occasionally was represented at the Royal Scottish Academy. He was also elected a member of the Royal Scottish Water-Colour Society. Of his three paintings in the Glasgow Institute this year, a notably fine one is a seascape at Portsoy. He has, in water-colour especially, painted quite a number of Dutch landscapes in brilliant tints.

Mr. Portsmouth was born at Reading in 1874, and received his early art education at the Oxford University Extension College under the direction of Mr. Walter Crane. After a short stay in Paris and Brussels he went to London to study under Professor Lanteri. He has been a regular exhibitor at the Royal Scottish Academy, the Glasgow Institute of Fine Arts and the Scottish Society of Artists, of which last-named Society he is a member. He has also been an exhibitor at the Royal Academy's exhibitions. Mr. Portsmouth's chief and most recent works include his figure of "The Captive," which is shown in this year's exhibition of the Royal Scottish Academy; his life-size figure of "Mirth," which was exhibited at last year's Academy, and a frieze representing "Labour." Besides "The Captive" Mr. Portsmouth exhibits in this year's Academy a bust of Master Edmund Findlay, son of Mr. John R. Findlay, of Aberlour. His exhibits at the Glasgow Institute of Fine Arts this year include a statuette entitled "Hermo Satyr," a bust of Mr. John Spence Smith and a medallion entitled "In Memoriam." Mr. Portsmouth, whose portrait-busts have always been considered very successful, has done a great deal at the Edinburgh School of Art to foster the study of sculpture as a necessary part of art education.

Mr. James Miller, the new architect Associate, is a Perthshire man. He was educated at Perth Academy, and served his pupilage to the architectural profession with Messrs. Heaton, Perth. Subsequently he went to Edinburgh, and for part of the time there was with Mr. Hippolyte J. Blanc, R.S.A., F.R.I.B.A. Removing to Glasgow, he was engaged by the Caledonian Railway Company to carry out architectural work in connection with several of their stations, notably Gourock station and Bridge Street station, Glasgow. In 1893 Mr. Miller began practising on his own account, and since then his name has come prominently before the public as an architect of much attainment. Among the more notable buildings erected to his designs in the last few years have been the Glasgow International Exhibition of 1901 and Clydebank Municipal Buildings, and he has at present on hand the new Hydropathic at Peebles, Glasgow Royal Infirmary, large extensions of Glasgow University, a fine hotel for the Glasgow and South-Western Railway Company at Turnberry, large official buildings for the Caledonian Railway Company in Union Street, Glasgow, and an important addition to the Central Station hotel. He has also been appointed by the Cunard Steamship Company as advisory architect for the interior decoration of their latest turbine express leviathan building at Clydebank. Five years ago Mr. Miller was elected a Fellow of the Royal Institute of British Architects, and he is a member of the Glasgow Institute of Architects.

TESSERÆ.

Influence of Byzantium.

WHATEVER share the city of New Rome took in actually producing works of industrial art under her emperors, she was at least the foster-mother of those arts for all Mediæval Europe, and from her came that influence which brought about the new art of Europe, whose origins are obscure enough till they met and fused at Constantinople into a style which for centuries after was world-wide. This was natural enough. Looked upon as an European city, Byzantium was for long the only great city of Europe that was really alive and dominant. In peace and war, as a mistress or an enemy, she dealt with all the great birth countries of art and letters—nay, of human life. India, Mesopotamia, Syria, Persia, Asia Minor, Egypt, the ideas and arts of all these countries touched her and mingled with the remains of the older art of Greece, from which the academical ism of the long Romano-Greek period had not crushed out all the life, sorely as it had weighed upon it. Byzantium, then, the Byzantium of Justinian and onwards, we must look upon as the capital of the industrial arts from the sixth to the thirteenth century.

Antique Saws.

The saws of the Grecian carpenters had the same form, and were made in the like ingenious manner as ours are at present. This is fully shown by a painting still preserved among the antiquities of Herculaneum. Two genii are

Digitized by Google

represented at the end of a bench, which consists of a long table that rests upon four-footed stools. The piece of wood which is to be sawn through is secured by cramps. The saw with which the genii are at work has a perfect resemblance to our frame-saw. It consists of a square frame, having in the middle a blade, the teeth of which stand perpendicular to the plane of the frame. The piece of wood which is to be sawn extends beyond the end of the bench, and one of the workmen appears standing and the other sitting on the ground. The arms, in which the blade is fastened, have the same form as that given to them at present. In the bench are seen holes, in which the cramps that hold the timber are stuck. They are shaped like the figure seven, and the ends of them reach below the boards that form the top of it. The French call a cramp of this kind *un valet*. Montfaucon also has given the representation of two ancient saws taken from Gruter. One of them seems to be only a blade of a saw without any frame, but the other resembles a cross-cut saw. One may, however, perceive both the handles between which the blade is fastened; the wooden bar that binds them together, though the blade is delineated too near it; and about the middle of this bar, the piece of wood that tightens the cord which keeps the handles as well as the whole instrument firm. Saws which were not placed in a frame, but fastened to a handle, were described by Palladius.

Pompeiian Temples.

An essential feature in the temples of Pompeii, as distinguished from those of Greece, is to be observed in the podium, or basement, on which they were elevated. In the religious edifices of an early age no such character appears. They were placed upon two or three steps only, if steps they should be termed, when evidently not proportioned for convenience of access to the interior, but calculated rather with a view to the general effect of the whole structure. By thus raising the floor to a level with or above the eye, the whole order, from the stylobate, or continuous platform on which the columns rest, to the roof was brought at once into view. The steps, Vitruvius says, should be of an odd number, that the right foot, being planted on the first step, may also first be placed on the pavement of the temple. To enter with the left foot foremost was considered unlucky. With regard to the proportions of the interior within the porticoes, the breadth is directed to be half the length, and the cell to be a fourth part more in length than in breadth. The building is directed to stand east and west like our churches, and the statue of the presiding deity to be elevated above the altar, that the suppliants and priests might decently look up to the object of their worship. Thus an hypæthral temple would present a most splendid scene, the worshippers addressing their vows, the image apparently rising to behold them, and the building itself boldly projected on the eastern sky. It will be recollected that these are merely the rules laid down by Vitruvius. It does not follow that they were always observed.

Reynolds's Palette.

Sir Joshua's usual dead colouring was what is commonly termed black and white, a little red only being used, and no yellow in the first process. Sometimes it was lake, black and white; sometimes red lead, black and white, with vermilion occasionally; sometimes asphaltum and white, with vermilion and black; sometimes umber and white, or Vandyke brown and white, with blue and red; and sometimes lake and yellow and white without red. There were few heads which he did not glaze, either with lake and transparent yellow, with vermilion used thinly as a stain, with asphaltum or lake and asphaltum, with yellow ochre, orpiment or Naples yellow used transparently, or with black and red or blue and red as his picture might require. In most of his preparations blue or blue-black were used, and not black alone. The object of all these different modes of beginning was brilliancy and transparency of colour, which he soon discovered could not be acquired by using many colours at a time; such as were deficient in the first preparation were therefore added in the subsequent ones, but always, it must recollected, in such a manner as to allow the preparation beneath to appear more or less through what was passed over it, particularly in the half-tones. It signifies little whether a head be begun with red or with yellow, for both colours are found in some proportions in flesh, but they cannot be used together, unless by a very skilful hand, without destroying in some degree the purity of both. The red preparation passed over with yellow or the yellow one passed over with red would produce under proper management the same effect. Transparency is all that is necessary, in a greater or less degree as required, and, provided the one colour appear through the other, it is of little importance which is used first. Glazing, of course, must always be regulated by the state of the picture to which it is applied, and the transparent colour which may be proper for one could not perhaps be used with propriety in another. Sir Joshua's vehicles were mostly varnish and wax and varnish, sometimes copaiva and wax, and occasionally wax alone dissolved in turpentine and thinned with the same as required. Over these he sometimes finished in oil or copaiva, either alone or mixed with wax, and sometimes with varnish or wax and varnish as he began. He would sometimes begin with oil and finish with Venice turpentine and wax, or wax and varnish, painting hard drying substances over soft ones, and soft over hard, indiscriminately; nor did he ever dream of the consequences of doing so till the cracking of his pictures made them manifest.

Roubiliac and Johnson.

Roubiliac, the sculptor, desired of Sir Joshua that he would introduce him to Dr. Johnson at the time when the Doctor lived in Gough Square, Fleet Street. His object was to prevail on Johnson to write an epitaph for a monument on which Roubiliac was then engaged for Westminster Abbey. Sir Joshua accordingly introduced the sculptor to the Doctor, they being strangers to each other, and Johnson received them with much civility and took them up into a garret, which he considered as his library, in which, besides his books, all covered with dust, there was an old crazy deal table and a still worse and older elbow-chair having only three legs. In this chair Johnson seated himself, after having with considerable dexterity and evident practice first drawn it up against the wall, which served to support it on that side on which the leg was deficient. He then took up his pen and demanded what they wanted him to write. On this, Roubiliac, who was a true Frenchman, as may be seen by his works, began a most bombastic and ridiculous harangue on what he thought should be the kind of epitaph most proper for the purpose, all which the Doctor was to write down for him in correct language, when Johnson, who could not suffer any one to dictate to him, quickly interrupted him in an angry tone of voice, saying, "Come, come, sir, let us have no more of this bombastic, ridiculous rhodomontade, but let me know in simple language the name, character and quality of the person whose epitaph you intend me to write."

Pembroke Churches.

The Pembrokeshire type of parish church is found, as a rule, only within the English-speaking districts of the county, and no specimens are found within those districts on the shores of St. Bride's Bay. Their main features are tall and slender towers, generally diminishing as they rise, a general rudeness of masonry, and internally much vaulting, with side chapels and squints, and many holes and corners, and a general effect of cavern-like obscurity. Of these churches a more typical example cannot be found than Manorbier, near Tenby. They are very peculiar, but more in their general tone and effect than in any particular details. Unhappily the hand of the restorer has been somewhat busy among them, and it is not always easy to make out how much one is to believe of what one sees.

GENERAL.

Mr. Charles Nicolls Woolnoth, R.S.W., died last week at his residence, 3 Kelvingrove Terrace, Glasgow. Mr. Woolnoth, who had been in failing health for some time, had attained the age of ninety years. He was one of the founders of the Royal Scottish Society of Painters in Water-Colours, of which Sir Francis Powell is president, having become a member in March 1878.

Mr. T. G. Jackson, R.A., Mr. Francis Fox (the consulting engineer), Mr. J. B. Colson (the cathedral architect and surveyor) and Mr. Walter Hill (managing director of the contractors, Messrs. Thompson & Co., of Peterborough), after a consultation at Winchester Cathedral, decided to continue the present steam-pumping operation.

The Glasgow Society of Artists will hold an exhibition in November this year in the Royal Glasgow Institute's galleries. They held a very successful exhibition in the Doré Gallery, London, last year, so that it will be two years since their previous show in Glasgow.

The Headmastership of the York Art School recently became vacant, and the Corporation, ignoring the education committee's recommendation, passed a resolution appointing Mr. Windass, who was formerly a member of the teaching staff of the school, to the position, at a salary of 300*l.* The education committee, on Friday, passed a resolution declaring the Council's appointment to be *ultra vires*, and deciding to ignore it. Leave will be asked to advertise the vacancy.

The City Engineer of Norwich, in his annual report, states that, for purposes connected with sewers, the supply of electricity, gas and so forth, the streets were broken up on the average in seventy-two places during every week of 1905. The engineer makes the following comment:—"It is impossible to maintain streets in convenient and good condition where subject to such treatment, but in progressive towns there is no available way of avoiding it. The subways often proposed are quite out of the question for general use."

The Leeds and Yorkshire Architectural Society at their meeting on the 22nd inst. elected the following officers for the ensuing session:—President, Mr. H. S. Chorley, M.A. (A); vice-presidents, Messrs. P. Robinson (F) and S. D. Kitson, M.A.; hon. treasurer, Mr. C. F. Bowman; hon. librarian, Mr. F. Musto (A); hon. secretary, Mr. A. E. Kirk (A); members of Council, Messrs. W. G. Smithson (A), F. E. P. Edwards (F), C. B. Howdill (A), H. A. Chapman (A), A. R. Hill (A), and G. E. Reason (assoc. member). Mr. W. H. White read a paper on "Modern Town House Architecture."

The Institute of Engineers and Shipbuilders in Scotland at the last meeting in Glasgow considered competitive designs for the new premises to be erected at the corner of Elmbank Street and Elmbank Crescent. Fifty-one designs were sent in. The plan by Mr. John B. Wilson, 92 Bath Street, Glasgow, was accepted. The design of Messrs. Mitchell & Whitelaw, Glasgow, was placed second, and received a premium of 76*l.*; that of Mr. H. E. Clifford, Glasgow, third, with a premium of 50*l.*; and that of Mr. W. F. M'Gibbon, Glasgow, fourth, with a premium of 25*l.* The building as designed by Mr. Wilson is estimated to cost, when complete, about 25,000*l.*

An Exhibition of works by members of the French National Society of Fine Arts will be held in the Château of Bagatelle shortly. No work will be received which was produced later than 1896. A third of the receipts will be given to the Municipality of Paris for the purchase of works of art.

The Borough Surveyor of Chelsea, by direction of the works committee of the Council, has submitted a scheme for the extension of the Chelsea Embankment west of Battersea Bridge by 400 or 500 yards. The committee recommend the Council to transmit a copy of the plan to the London County Council, and to again urge that body to arrange for the carrying out of the scheme as a metropolitan improvement.

A Privy Council announcement in the *London Gazette* states that petitions have been presented to the King in Council by the Marquis of Bute and others, praying for the grant of charters for the creation of a national museum for Wales and of a national library for Wales. His Majesty has referred the petitions to a committee of the Lords of the Council, and all petitions for or against such grants should be sent to the Privy Council Office on or before April 23.

Mr. D. G. Hogarth has in preparation for the Trustees of the British Museum a monograph on the exploration of the site of the Temple of Artemis, at Ephesus. Mr. Hogarth has been in charge of the explorations at this place which have been carried on on behalf of the Trustees during the past two seasons.

The Council of the Surveyors' Institution have accepted an invitation from the Warwick and Worcester provincial committee to hold their next country meeting at Birmingham on May 24 and 25. Visits are being organised to Warwick, Stratford-on-Avon, Kenilworth and Worcester.

The Project to erect a statue of Thomas Carlyle in Edinburgh has been abandoned owing to an insufficiency of contributions. It is proposed to fix a brass tablet in St. Giles's Cathedral.

A Scheme has been prepared for the reconstruction of the Grammar school of Newark, which was founded by Archdeacon Thomas Magnus of York in the fourteenth century. The cost is estimated at 10,000*l.*

Mr. Albert E. Bullock, A.R.I.B.A., has opened offices at 5 John Street, Bedford Row, London, W.C.

We are informed that the partnership existing between Mr. William A. Pite, F.R.I.B.A., and Mr. R. S. Balfour has been dissolved as and from February 24 last.

An Arts and Crafts Exhibition is to be held at Alderley Edge on four days in the first week of May, with the object of offering "some tangible inducement to all classes, especially the younger portion of the population, to cultivate some useful, artistic or interesting hobby as an employment for winter evenings." Prizes amounting to 100*l.* are offered in 152 classes.

Mr. J. C. McConachie, a Glasgow artist, was found dead in his studio in Bath Street, Glasgow, on Monday. There was a cut on his right arm and another on his right ankle.

A Committee of the Birmingham Corporation recommend that the successor to the late Mr. Price as city surveyor and engineer should not be paid less than 1,250*l.* per annum. Candidates are to be sought by advertisement.

The New Buildings for the Cork Young Men's Association were opened on Monday. Arrangements have been made in the planning to allow of the annual synod of the diocese and other work being transacted there. The architects are Messrs. W. H. Hill & Son.

Mr. Herbert Jones, F.S.A., president of the Greenwich Antiquarian Society, is superintending the excavations now being made in Greenwich Park with the view of adding to the discoveries of Roman remains which have been made there from time to time.

The Collection of twenty-two pictures by Corot formed by the late Mr. Staats Forbes will be exhibited at the Leicester Galleries, Leicester Square, for a few weeks from Saturday, March 31, when it will be dispersed. The exhibition will include pictures by the other painters of the Barbizon School.

The Leeds Corporation have applied for authority to sanction the borrowing of 300,000*l.* for street improvements. It appears that 141,370*l.* of the amount has been already expended without any authority.

A House of Lords Committee have approved of the Bill which authorises the Manchester Ship Canal Company to seek for minerals beneath the Manchester Ship Canal.

A Proposal has been made which is likely to be accepted, that engineering students of the University of Birmingham should go through a course of accounting in the commercial department.

The Spring Exhibition at the Whitechapel Art Gallery, which illustrates "Georgian England," was opened on Wednesday, the 28th inst., and will close on May 9. Admittance is free. Among the special points of interest may be mentioned a large number of pictures by Hogarth, Zoffany, Gainsborough, several by Reynolds, Brown, Ruskin, Hoppner, &c.

An Appeal is being made for funds for the restoration of the ancient church of St. John the Baptist, Coventry. There is urgent need of a thorough restoration of the exterior, the stone used for its repair in 1877-9, by Sir Gilbert Scott, having proved peculiarly sensitive to weather and climatic conditions. The church, which is one of the most perfect specimens of Late Decorated and Early Perpendicular architecture, dates from 1350. Messrs. Bucknall & Comper, architects, Westminster, and Messrs. Thompson & Sons, contractors, of Peterborough, after a careful examination came to the opinion that a thorough restoration of the exterior of the church is necessary, at an estimated cost of about 4,500*l.*

The Church of St. Michael, Burleigh Street, Strand, which was designed by Mr. James Savage in 1833, was sold by auction on Tuesday for 20,500*l.* A condition of purchase was that the remains of the building should be taken down and removed by the purchaser. The site was described as a most important one, having frontages of about 142 feet, occupying an area of 4,450 square feet.

The Norwich Town Council have resolved that the salary of Mr. A. E. Collins, city engineer, be advanced from 800*l.* by annual increments to 900*l.*, that official to devote his whole time to the duties of his office, his private practice, both direct and indirect, to be absolutely discontinued, except that he should be at liberty to advise the Port and Haven Commissioners. It was also provided that, subject to the consent of the general purposes committee, he be allowed to give expert assistance to other municipalities, the fees so received to be paid into the borough funds.

The Architect.

THE WEEK.

It was supposed that when the Council of the Society of Arts, after devoting much time to the project, withdrew from further consideration of an amalgamation with the London Institution there was an end to the negotiations. But on Monday there was a meeting of the Institution, when it was proposed:—"That any proprietor preferring to withdraw from the scheme shall receive an amount to be fixed by arbitration in discharge of his rights and interest in such share." It was stated that proprietors who approved of an amalgamation should be allowed some liberty. An amendment was moved to the effect that a qualified architect should be instructed by the managers to prepare, at his own expense and risk, plans for the better utilisation of the present site, and that until a scheme for the reconstruction of the Institution had been submitted to the proprietors, the consideration of the proposal for amalgamating with the Society of Arts should be adjourned. Although the amendment was declared by the chairman to be informal and was not accepted, it should not be overlooked as evidence that men of high standing in the City are willing to employ an architect on important duties without any payment of fees. That state of mind will not convince reasonable people about the competence of the opposition to deal with the project. The meeting separated without coming to a conclusion respecting the question of withdrawing.

On Tuesday the London County Council (General Powers) Bill was approved by a committee of the House of Commons. The Council already possessed power to acquire monuments and to purchase and maintain buildings of historic or architectural interest. It was discovered, however, when Mr. Thornycroft's group *Boadicea* was presented that they were unable to expend money to supply a base. In 1904 the Whitechapel Art Gallery, which is supposed to have cost 16,000*l.*, was offered to the Council and could not be accepted because there was no power to acquire and maintain such buildings. The City Corporation, which is easily alarmed at any progressive step of the County Council, wished to be exempted from contributing to the acquisition of such property. The reason offered was that the City possessed already a museum and library and a collection of pictures. The committee were, however, unable to grant the desired exemption. It is surprising that the Corporation should not have more public spirit. Years ago many interesting buildings within the City might have been rescued from destruction if the Corporation were disposed to anticipate the proposals of the County Council.

If the study of Irish archæology receives more attention than formerly the credit must be given in a large measure to German scholars. O'Donovan, who was the greatest of the Irish philologists, never hesitated to admit his inferiority to the Brothers Grimm, who had made the Celtic language interesting to students in most European countries. It is an advantage not only to students, but to Irishmen, to have it demonstrated that in the arts and sciences they were not isolated, and that the products which are known as Celtic bore some relation to what was found not only in Europe but in Asia. That relationship was for a long time dependent on fanciful theories like those of Vallancey and Betham. But when objects can be presented which have characteristics in common, then some certainty is given to deductions. It was, for instance, a loss to Ireland when the gold objects were removed from the British Museum to Dublin, for it is not to be expected that foreign investigators will cross the Irish Channel in order to see them. In the British Museum they could be compared with similar objects. The case was not, however, properly explained. The Irish people, having gained, are now eager for further victories, and they have applied for the ancient Irish bells, which are in the museum, on the grounds that they are of no value to the institution and of no interest to the British public. It does not require many days in the British Museum to become convinced that there are visitors to the collections who are not natives of Great Britain. Foreigners possess a claim to have the archæology of the islands exemplified, and it would be absurd to inform them that they must make another voyage in order to see such objects. Happily for a time there is a true scholar who has the management of Irish affairs, and he is not to be bamboozled by efforts to represent the Irish as eager students of antiquity. Mr. Bryce has said:—"I am informed that the ancient Irish bells in the British Museum are regarded by the trustees as possessing, in relation to the native art of Britain and other countries, a very decided interest for students generally. The British Museum aims at being a Museum of general archæology, and for the purposes of archæological study in the widest sense, the trustees endeavour to make their collections as representative as possible." If Mr. Bryce had been in office when the gold ornaments case was heard, there is no doubt they would still be found in Bloomsbury.

There is no country in Europe in which so much attention is given to postage stamps as in France. Several changes have been made, and the arrangement by which penny or 10 centimes postage is to be recognised throughout France has caused a revision of the stamp at present in use. It represents a woman with a Phrygian cap sowing seed. French critics, including artists, have discovered that it is incorrect. There is a sunrise in the background on the right, but the figure appears to be lighted from the left; and, moreover, in spite of the sun's rays, the whole background is dark, and the stamp might be a reproduction of a bas-relief. The late postal Minister before his retirement from office had a consultation with high officials and with M. Roty, the artist, and M. Mouchon, the engraver, whose names are allowed to appear on the stamp. It has been decided to alter the position of the sun Henceforth it will appear on the left of the sower, and the rays will produce their logical effect, for the whole of the background will be lighted and the figure of the woman will also gain by illumination. As in the more expensive stamps, the words "République Française" will stand below, and the word "Postes" will be introduced in a corner. The altered stamp comes into use on April 16, and is more effective than its predecessor.

If superstition prevailed in the Quartier Latin the failure of the great fountain at the top of the Boulevard St. Michel would be considered as ominous. Of all the fountains in Paris it was probably the most admired, although it was one of the relics of Napoleon III., for it only dates from 1860. No doubt its position is not advantageous, for it suggests that the end wall of an ordinary house was transformed into a fountain, which appears to be merely an unusual wall decoration. But able sculptors produced the figures, the principal being the work of Duret. Several months ago the water ceased to flow, and it is needless to say that countless protests were at once sent to the authorities. Those who felt aggrieved by the withdrawal of a familiar sight and sound were not informed about the cause or the reparation. We may imagine that as the works of the underground railway were to be carried in front of the fountain the municipal engineers waited to see the effect of the excavations. The fountain has been enclosed by a hoarding. But all who pass by can again hear the small cascade flowing into the basin. It may therefore be assumed that when the railway is completed the hydraulic machinery will be effectively in action.

THE HOUSES OF PARLIAMENT.

IF the members elected to the new Parliament continue to attend with as much assiduity as they have done since the Session opened, it must be expected that the necessity for enlarging the House of Commons will be again urged. Such an undertaking is possible to a limited extent. When, however, Barry designed the building the circumstances which now appear to be impending were not anticipated. The House of Commons was then supposed to be, above all things, the finest club in Europe. It was not believed that a time would come when members would be paid fixed salaries, and were in return to attend the sittings and committee-rooms during regular hours. In the future it must rarely happen that a difficulty will arise of gathering a sufficient number of members to form a "House." For the majority of them it will not be enough as hitherto to have it stated at the end of a session how often they voted. Paid members must approximate to officials, and, whether they are useful or otherwise, will have to spend some hours daily awaiting an opportunity to speak or vote. That was not the kind of assembly which had to be provided for seventy years ago, and the architect cannot be blamed if the Houses of Parliament recall ancient rather than modern requirements. It may therefore be not uninteresting to recall the circumstances which led to the erection of the great group of buildings.

A contemporary chronicler, in recording the destruction of the old building in 1834, wrote as follows:—"Both Houses of Parliament were burnt to the ground on the night of October 16, and it is said to be the intention of Government to rebuild them on the same spot. Perhaps this may be desirable on account of the offices in the neighbourhood, but we must confess we should have preferred a more open and elevated site. Were it not that we should regret to see the space intended to be left open at Charing Cross covered with buildings, we should have pointed to it as a suitable situation. A large and lofty quadrangular building there might easily be made to contain both Houses of Parliament, with all the offices and other appendages necessarily connected with them." This statement is interesting, for it indicates a belief that the site at Westminster was not adapted to the necessities of a modern Parliament house. The Thames in those days was offensive, and it necessarily formed the limit on one side. Westminster Hall, the Law Courts, Westminster Abbey and School restricted the site on the north, and all the space open for extension was on the west in the direction of Millbank, and did not offer an attractive prospect. But old associations were too powerful, and it was supposed to be necessary to have a close connection between the building where laws were to be enacted and the courts where they were to be interpreted.

On the night of the fire Charles Barry, who was then in his thirty-ninth year, was one of the spectators. According to his son's account:—

> Mr. Barry was returning from Brighton on the coach, when a red glare on the London side of the horizon showed that a great fire had begun. Eager questions elicited the news that the Houses of Parliament had caught fire, and that all attempts to stop the conflagration were unavailing. No sooner had the coach reached the office than he hurried to the spot and remained there all night. All London was out, absorbed in the grandeur and terror of the sight. The destruction was so far complete that preservation or restoration was out of the question; the erection of a new building was inevitable, on a scale and with an opportunity for the exercise of architectural genius hitherto unexampled in England. The thought of this great opportunity, and the conception of designs for the future, mingled in Mr. Barry's mind, as in the minds of many other spectators, with those more obviously suggested by the spectacle itself.

It seemed not unlikely that Sir Robert Smirke would secure the commission. He was in the confidence of the Government, and he had to prepare the temporary buildings for the use of the Lords and Commons. That gave him a hold on the situation which he knew how to turn to his own advantage. Sir Edward Cust, who suspected the intentions of the authorities, issued a pamphlet addressed to Sir Robert Peel on the expediency of a better system of control over buildings erected at public expense and on the rebuilding of the Houses of Parliament. In the course of it he said:—"The last plan adopted by the Government was, I believe, to call in council a certain number of the sages of taste. The public is, I believe, still in ignorance of the method adopted in the selection of the architect. As usual, to use a vulgar phrase, 'a tub was thrown out to the whale,' and as in the case of Buckingham House, the country was informed they were only going to enlarge an old building; so another old building was to be patched up and altered at a trifling cost, and on the top of the scheme the Minister found an architect ready to his hand without it being known correctly at whose door the responsibility of the choice remained." The words evidently mean that Smirke was to be accepted as the architect for the new building. Sir Edward Cust recommended that finance alone should be left to the Woods and Forests, who had the control of the buildings, and that five gentlemen should be appointed to arrange about the style, the conditions of the competition and the selection of the architect. His suggestion was adopted. In June 1835 instructions were issued which prescribed that the style of the buildings was to be either Gothic or Elizabethan. The designs were to be sent in before January 20, 1836.

It is needless to say the style or styles recommended did not secure approval by all the architects of the time. There were few who could be considered as having given much attention to Gothic. Charles Fowler, while expressing satisfaction that the official system of appointing one architect had been abandoned, still considered from so unexpected a proposal that a Gothic design had been already prepared for the building. As to the style, he declared that the intended structure could not aspire to become more than a third-rate character, from its vicinity to two such commanding edifices as the Hall and the Abbey. A. W. Hakewill said the Classic style was so identified with the progress of refinement and civilisation, there could be no doubt it was most suited to the intellectual character peculiar to the subject. Benjamin Ferrey, who had some claim to be accepted as an authority on the other side, declared that if Grecian architecture claims nature as her prototype, it is not asserted with less truth that Gothic architecture is founded upon the same charm and principle, to which is added an increased portion of mathematical skill, combined with an endless variety of beauty in its ornaments, of which the germ may be found in the botanical works of nature only.

Pugin was, however, the architect whose devotion to Gothic was at the time most remarked. In the course of a pamphlet which he wrote in reply to Hakewill he said:—

> A feeling of admiration and respect for the noble works of our forefathers has arisen which I trust and believe will never be suppressed. It has been discovered that, in lieu of borrowing our architecture from foreign climes, we possess buildings whose character is more suited to our country and climate, and that, much as Classic beauty may be admired in the countries where those styles flourish, still to sacrifice the varied and applicable styles which were employed in our country during the Middle Ages for the dry and monotonous temples of Athens, shorn of their principal characteristics of gigantic size and simplicity, to render them at all fit for present purposes, is a folly that is every day growing more glaring; and as errors, when perceived, give hope that they will be amended, I trust fully that Anglo-Greek will shortly cease to exist, except in the buildings erected during the last few years, whose slight constructions give great hopes of their speedy decay—a result most fervently wished for by yours most truly.

There were ninety-seven competitors. The com-

Digitized by Google

missioners appointed to make a selection were Mr. Hanbury Tracy, Sir E. Cust, Mr. Thomas Liddell and Mr. George Vivian. On the last day of February, 1836, the award was published, and the first premium went to Charles Barry. The estimated cost, after allowing for old materials, was put down as 693,104*l.*, with 129,000*l.* for an embankment, and the works were expected to be completed in six years.

Pugin's name did not appear among the competitors, although some architects had anticipated that he must have succeeded. His biographer says he then committed the great mistake of his professional life. It is believed that he aided Mr. Gillespie Graham in a design which was not among those premiated, although it is said to have been strikingly Mediæval in treatment.

The decision was not accepted with unanimity. The advocates of the Classic style continued to insist on a change. Many of the unsuccessful competitors held an exhibition of their designs, and on the strength of it the designers announced that the public did not endorse the award of the judges. The case was brought before the House of Commons by Joseph Hume, the advocate of economy, who endeavoured to excite alarm about the contemplated expenditure. But Sir Robert Peel was able to convince the House of the care which had been taken to bring about a satisfactory result. Little time was lost before the works were commenced, and then it may be said that Barry's real troubles began, for he had to deal not with one client, but with several independent authorities, none of whom appear to have had precise notions of what should be done, but who posed as supreme in art and construction.

Barry must soon have realised that more accommodation was needed. The House of Commons is, under the new conditions, too confined for the large number of members who will have to be present. But there are other needs, and it would be an advantage if some, if not all, of the ministerial work was transacted close to the Houses. In Barry's day it was not contemplated to bring offices to Great George Street and Charles Street. Realising that the removal of the law courts would be advantageous to the palace he had erected, he proposed not only to erect committee-rooms and commission-rooms on the site, but to carry new buildings along Bridge Street to the Clock Tower. The entrance to Palace Yard would be at the angle, and he proposed to have there a gate tower. In other words, the Parliamentary buildings would be continued from the Victoria Tower to the Clock Tower, and there would be an exterior and interior group, the effect of which would surpass the Houses of Parliament as now seen. The arrangement would also have the advantage of allowing of a view which would be more impressive than one from the Thames or from the opposite embankment. In 1855 there was much discontent with Barry's building, arising mainly from imaginary shortcomings, and the proposals which he then brought forward did not receive the attention they deserved.

THE REPORT OF THE ROYAL COMMISSION ON TRADE DISPUTES.

By W. S. Holdsworth, D.C.L.

II.

In this paper we shall consider the recommendations of the Commissioners upon the subject of picketing, and upon the law of conspiracy as it affects trade unions.

The present law upon the subject of picketing is contained in Section 7 of the Conspiracy and Protection of Property Act, 1875. Shortly stated, its effect is as follows:—Any person who, with a view to compel any other person to do or to abstain from doing anything which that person has a legal right to do or abstain from doing, does certain acts, is liable on summary conviction to fine or imprisonment. The acts enumerated are violence or intimidation directed to the person himself, his wife or children; persistently following him about from place to place; hiding tools or hindering him in the use of them; watching or besetting the house where he resides or carries on his work; and following him about the streets in a disorderly way. There is a proviso that attending at the house where a person resides or works merely to obtain or to communicate information is not a watching or besetting within the meaning of the Act. This section renders watching and besetting for any purpose other than that of obtaining and communicating information an offence. It therefore renders watching and besetting for the purpose of peacefully persuading or, in other words, picketing, an offence. It has sometimes been said that the Courts have punished workmen for peacefully persuading. The Commissioners point out that this is a mistake. "No workman has ever been punished under this Act for merely peacefully persuading. What he has been punished for is watching or besetting a house, &c., with the view of peacefully persuading—a different matter." The Trades Disputes Bill of 1904 (*The Architect*, June 17 and 24, 1904) attempted to legalise peaceful picketing. We said in commenting on that Bill that peaceful picketing was really a contradiction in terms. So say the Commissioners. "The evidence on this matter laid before us is on this point really overwhelming, and is evidence which the trade unions have made no attempt to contradict. What it comes to is this, that *watching and besetting* for the purpose of peaceably persuading is really a contradiction in terms. The truth is that picketing, however conducted, when it consists of watching and besetting the house, &c. . . . is always and of necessity in the nature of an annoyance to the person picketed. As such, it must savour of compulsion, and it cannot be doubted that because it is found to compel that, trade unions systematically resort to it." These views are sound and clear, and we might expect that the Commissioners would make some definite proposal that the arm of the law should be strengthened against such practices, especially having regard to the fact that the proportion of unionist workmen to non-unionists is about one in ten. Instead of that, the Commissioners propose to strike out the watching and besetting clause of the Act of 1875, and to substitute for it a clause making it an offence to "act in such a manner as to cause a reasonable apprehension in the mind of any person that violence will be used to him or his wife or family, or damage be done to his property." We cannot think that this recommendation is consistent with what the Commissioners themselves state as to the character of the evidence offered upon this subject. What is wanted is the sharp and short process of summary conviction directed to the actual evil—watching and besetting. This process is the only process competent to strike at the evil, and it is clear that it can be much more easily struck at by retaining the existing clause, than by substituting for it a clause of a more vague and general character, under which it will clearly be more difficult to convict. The views of Sir Godfrey Lushington as to the evils of picketing are the views of the majority of the Commissioners, but his conclusions are more logical. "Picketing," he says, "is a form of industrial conscription, and in organising it, trade unions act as if they represented not only their own members, but the entire body of workers, and had authority to enforce regulations to which all were bound to conform. I am of opinion that picketing is an abuse for which a remedy is urgently required, and that the personal freedom of workmen needs not less protection than hitherto, but more. I therefore recommend that the existing prohibition of watching and besetting be retained, and that the proviso permitting it for the sole purpose of giving and receiving information be repealed."

We pass now to the difficult subject of conspiracy. Upon this subject the Commissioners recommend that it should be enacted that "an agreement or combina-

Digitized by Google

tion of two or more persons to do or procure to be done any act in contemplation or furtherance of a trade dispute shall not be the ground of a civil action unless the agreement or combination is indictable as a conspiracy, notwithstanding the terms of the Conspiracy and Protection of Property Act, 1895." The effect of this recommendation is to enact for the offence of conspiracy considered as a civil wrong what the Act of 1895 enacted for conspiracy considered as a crime. In effect it overrules the law as laid down in the case of Quinn *v.* Leathem. The substantial reason for this recommendation is the extreme obscurity of the law as it at present stands. The law as to conspiracy to injure is so indefinite that it is no guide to workmen as to what acts may and what acts may not be done during a strike. Indeed, most lawyers find it hard to advise as to what acts will and what acts will not constitute an actionable conspiracy. Does any combination to do acts which are not themselves torts, with an intent to harm others, amount to such a conspiracy? What will amount to an intent to harm others? Is there any, and if so what, justification for such acts? Will self-interest be such a justification? None of these points can be answered with certainty. Hence, if a lawyer is asked whether it is actionable to organise a strike against non-unionists, or to persuade a workman to strike, or to persuade a strike in sympathy with a strike already in progress, he can give no clear answer. "The upshot of the whole is that the law of conspiracy to injure as recognised in Quinn *v.* Leathem places it in the power of a judge and jury, if in their discretion they should so think fit, to treat any joint conduct whatever as actionable, and, except so far as barred by the Act of 1875, criminal." We cannot but agree that a law so vague is pre-eminently unfitted to be a guide to the conduct of trade disputes. We should note, however, that this change in the law would leave trade unionists subject to the ordinary law of tort; and it should be remembered that persuasion to break a contract is a tort. It would also leave them amenable to the law if they infringed Section 7 of the Conspiracy and Protection of Property Act. If it was desired to prohibit any other acts, such acts could be added to those already prohibited by Section 7. "The prohibition would thus be enacted after discussion on the merits, and being recorded in a statute, would be intelligible to workmen and their advisers." Obscurity in a law is always bad; but when that obscure law is supposed to be a guide to ignorant men at a time when their passions are excited, and when non-compliance with it may entail heavy consequences, it is better that it should not exist. Obedience to the law is the lesson which trade unionists most need to learn. Their natural instinct to set themselves above it will only be increased if the law is so obscure that it cannot be learned. But it should be noted that this only makes it the more necessary that Section 7 of the Act of 1875 should be made not less but more definite. We agree that the doctrine of conspiracy, as applied to trade disputes, should be swept away. We think that it follows that nothing should be done to impair the efficiency of Section 7, which will then be the chief protection against illegal acts. This, in our opinion, adds another and a most formidable reason against the proposal of the Commissioners to modify that section, which we have discussed above. For it should be remembered that the process of summary jurisdiction provided by that section is the only process which is really fitted to deal promptly with offences of this kind. The ordinary process of indictment is too slow, and an action is useless when the defendant has no means wherewith to compensate the injured party.

From this summary of the more important features of this report it will be seen that the report itself and the cases and statutes there cited and explained merit careful study of all those interested in this important question. They present us with a history of the gradual emancipation of the workman and the trade union. The great problem which the State must face is the problem of co-ordinating this new power with the existing organisation of the State, in such a way that its reasonable activities on behalf of the working man shall not deprive other persons and bodies of the liberty to which they are equally entitled. When a class has been kept too long in a condition of undue subservience, the swing of the pendulum is apt to result in giving them that undue liberty which the inexperience of the recently emancipated usually demands. We cannot blind ourselves to the fact that many trade unionists aim at securing an undue liberty—a liberty to infringe the equal rights of others. They remind us of those Protestants who immediately began to persecute all who could not agree with them as soon as they had gained liberty of conscience for themselves. Like them they are inclined to rely upon strength rather than upon reason. Especially we must not forget, though perhaps it is an unpopular doctrine nowadays, that the liberty of the employer is in some ways more important to the community than the liberty of the working man. After all, employers are the generals of the forces of industry, and to hamper the activity of the general by a series of restrictions which tend to promote merely the comfort of the private soldier may well result in the loss of the whole army. Australia should be somewhat of an object lesson to us. Employers are already taxed heavily enough for objects which benefit the working man. If the aims of the extreme party among the trade unionists be realised, they will also be deprived of that control over their business which is essential to its successful organisation. The trade unions may find out too late that by grasping at too much they have lost all. The State may find out too late that by conceding too much to the importunity of a class it has destroyed the trade, and with the trade, the greatness of the country.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Mr. Leonard Stokes, vice-president, in the chair.

Two papers were contributed by Messrs. W. Aumonier and A. W. Martyn on

Wood-Carving.

Mr. Aumonier in his paper dealt principally with the treatment proper to wood-carving, and referred to the various ways of applying carving in architectural decorations. If the wood-carver, he said, can succeed in making these points of real interest in the scheme, and by a right understanding of the power of light and shade help the architect to bring his whole design into harmony, and if he impart into the work some subtle touches that will help to bring mystery and life into it, in however small a degree, he has done something to relieve the appalling monotony of machine-worked moulding and correctly planed boards—he has done something to justify the hope that he may be regarded as a brother artist working in sympathy with the architect towards a common end. Going into details of the carver's art in relation to architecture and treating of panel-work, the lecturer said that very fine effects can be obtained by the actual treatment of the work as light and shade, by putting some parts very low on to the ground and keeping others high. Even a bad design may be made to look tolerable by the way the work is, in the language of the craft, "thrown about," and a really fine design may have no interest if carved with no sense of relief or proper variety of surface. A design should never be too elaborate or intricate in character. The lecturer expressed his strong personal sympathy in favour of solid panels carved with a considerable amount of relief, some parts being high and others very low and dying delicately into the ground and combining with it. He felt, however, that in these days of a distinct, and to some architects disquieting, revival of the Grinling Gibbons sort of work, one could not ignore altogether the sumptuous effects arrived at by swags, &c., boldly applied on to the surface of plain panels. By this process rich and strongly decorative effects may be obtained which, perhaps, could not be conveniently accomplished by any other means. Styles or

Digitized by Google

rails forming part of the frames of carved panels should be treated very delicately and carved into the solid wood itself, so as not to lose the feeling of strength properly belonging to framing of any sort. Columns, if carved, should be treated in the same flat, solid manner as recommended for styles. Perforated work should be kept very flat on the surface. As regards mouldings, architectural decoration might be often improved by giving more thought to the suitable treatment of carved mouldings—for instance, keeping some of them very delicate in effect and some much stronger as a whole; while some may be delicate in parts and much stronger in others, always dividing the strength and delicacy to run in line with the edge of the moulding. The lecturer showed by means of diagrams various ways of treating enriched mouldings. Caps to columns or pilasters should never be overcrowded, but should show the bell plainly, thus revealing the strength of the column going right up to the abacus. They should be very lightly carved, and the volutes may be freely cut through in all directions, plainly disclosing the bell underneath them. As to carving generally, the lecturer deprecated all mechanical means of getting effect. He pleaded for its own treatment, that of real carved or cut wood, cut with sharp tools and alive with living, nervous cuts all over both subject and ground, making one harmonious whole. No part of the ground should ever be absolutely smooth like a planed board—no part of the surface of the carving itself ever robbed of all expression by the brutal use of glass paper or fish skin—all parts of the work should teem with the joy of life and effort which the carver felt in doing it. It should look as if wrought by a man.

Mr. A. W. Martyn briefly sketched the history of wood-carving from early times down to the present day, deducing the fact that the best work in all periods has been inspired by religious enthusiasm. How are we, he asked, to inspire enthusiasm, and will the expression of such enthusiasm elevate the public taste so that we shall not have such a character for the next fifty years as we have had in the past? To inspire enthusiasm one must have contagious enthusiasm oneself; had we a wood-carver—or, say, an architect—with the enthusiasm for his work that a man like General Booth has, we should find a marked improvement in all branches of architectural art. The lecturer emphasised the point that it is the architect who makes the carver. The architect must know what he wants, and must be able to inspire his carver with his requirements; he must work with him as a fellow artist, leading him on to produce that which is in his (the architect's) mind. The lecturer cited Grinling Gibbons as an example of an artist in wood who when left to himself simply became a clever expert with his tools: his work lacked architectural harmony, it was wood-carving pure and simple, without direction—witness the altar-piece at St. James's Church, Piccadilly. On the other hand, much of the same artist's work in St. Paul's Cathedral, though not nearly so well carved or so dexterous, has control; it has architectural harmony, and is part of the architecture, and, what is more, part of the architect. As regards the architect's knowledge of carving, intimacy with good work is essential; and a carver to give the best results must have a fair knowledge of architecture—*i.e.* the carver should know as much of architecture as the architect should of carving. Contagious enthusiasm cannot be within the power of all, but intimacy with one's subject and sympathy between the artists can be secured by every architect, and will to some extent remedy the deficiency in the lack of enthusiasm. Necessarily enthusiasm must be properly directed, must be placed at the back of knowledge to encourage and direct. But how is this knowledge to be secured in the fullest degree? Though real, useful, living knowledge is being given to students at some of the schools of art, we have no central leading authority to found or carry on any given school of carving. The school of Gibbons was created by his personal force in his work, which was lifted right away from its immediate surroundings to a height carving had not reached for 200 years. Since his time carving has steadily depreciated. We must now look for some artist to lead us along the line of progress; if it cannot be done alone, it may be by united efforts. Unless we can hand down to the younger generation some of the knowledge we have gained through the years of experience, so that the threads of our knowledge may be carried on indefinitely, we cannot make such progress as history has painted for us in the past. The old schools of painting were more or less continuous, the pupil often rising above the standard of his master, and so by continued growth the fullest development took place. The lecturer expressed a wish that it were possible to found such a school for carving. A London master, he said, had given twenty years' hard service, and had probably done more good in this direction than almost all the others combined. This work ought to be carried forward, and should receive the assistance and sympathy of architects. The lecturer suggested that as religious fervour was lacking, another spur should be found to help us along. Perhaps the best was ambition; at present ambition in a carver was almost dead. A gold medal might be founded on the lines of the royal gold medal for architecture, and presented annually, or even triennially, as an award of merit to the individual who had done something to raise the standard of his art, be it in mural decoration, stained glass, plasterwork, wood-carving, or any other branch of architectural work; the recognition should be public, so that the award should carry with it the good opinion of the art-loving public. But the opportunity must be created for continued study; there should be a central school directed by men of knowledge. By looking at the past one was able to judge of the future, so that in all probability the architectural profession must be looked to to raise the standard of work. The architect is the master, the carver the servant; but a direct and living sympathy must at all times exist between them if the best results are to be obtained. The lecturer referred to a little difficulty carvers continually meet with in connection with architects' sketches of carving. An architect will mark on his drawing the word "carving," and his assistant, often a junior, will roughly sketch what he thinks is required; and the carver is invariably affected by whatever is shown, no matter how rough. This is an important point; whatever is shown on the drawing should be strictly indicative of what the architect desires. A carver often produces a clever piece of carving by the inspiration of a clever sketch supplied by the architect.

Mr. Geo. Hubbard, proposing a vote of thanks to the authors of the two papers, said the subject of the lecture was essentially one of the high arts, and it became increasingly difficult to criticise those arts. As the leading architects had just been telling them, they could not criticise art, and he began to realise what was meant by that when he looked at some of the photographs around the room. He referred more particularly to one which showed a good deal of carving executed by Grinling Gibbons, which was originally in the chapel of Winchester College. Many years ago a leading architect had instructions to carry out certain works in that chapel, and when he saw the carving he did not consider it quite appropriate; at all events, said the speaker, the architect seemed to consider his own Gothic was much more suitable. The carving, therefore, was turned out whether it was appropriate or not for the chapel, and placed in the room of a house near Winchester. As a humble architect, the speaker said he would like to say that well as the carving looked in the room photographed, it might have been still handsomer in the position which Grinling Gibbons intended it to occupy. One of the characteristics of Grinling Gibbons's work was that he invariably neither enlarged nor diminished the size of the foliage, fruit or flowers he was depicting in his work, and he so arranged his carving that the fruit or flowers could be picked from where it hung by a person standing on the floor. The lecturers had explained how the best effects could be obtained, but there was a great deal more in wood-carving than just the effect that was attempted to be gained from the artistic point of view. There was a certain sentiment, and it was the duty of the carver to represent that sentiment. Architecture and carving were but representations of sentiment, quite apart from artistic effect. As the lecturers had pointed out, it was for the architect to instruct the carver in the work he was to carry through; it was therefore for the architect to explain the sentiment he wished to be found in the carving, and he should be able to convey that sentiment to the carver. It was thanks to lecturers such as they had just heard coming down to their meetings that architects could appreciate how they might assist in raising the standard of carved work.

Miss Eleanor Rowe, who seconded the vote of thanks, said she agreed with the points Mr. Aumonier had made in his paper about the treatment of rounds and mouldings and pierced carvings. With regard to Grinling Gibbons's work, the speaker said she would be sorry if there was a revival of it, although carvers could learn much from the original examples. There was a want of harmony in the work when a whole room was seen decorated in that way. In conclusion, the speaker commended the suggestion that the

Digitized by Google

Institute should offer a gold medal as an award of merit for art and craftwork, and the possibility of gaining such a prize would be a great encouragement to all carvers.

Mr. W. H. ATKIN BERRY said there was scarcely a word in Mr. Martyn's paper that would not appeal to the warmest sympathies of all who heard it. The paper had spoken of that undefinable thing, spirit in work, and had protested against the commercial spirit in art, that commercial spirit which was the bane of all that they as architects tried to achieve. Mr. Martyn said that architects made the carver. It might be so, but the speaker thought the architect was often in the hands of the carver, for he could make or mar the architecture by the carving. The paper had also alluded to the enthusiasm that was necessary. They all knew that enthusiasm was a potent force if it had scope and encouragement. Very often, however, they as architects deplored the lack of that encouragement. They were not masters of the situation, for they were in the hands of those who had to pay for the work executed, and often when the architect desired to employ the best talent, he was prevented from doing so by the want of enthusiasm on the part of his clients. Therefore, the architect could not be held responsible for any lack of encouragement to art as represented by carved work.

Mr. H. INIGO TRIGGS said he had always felt that Inigo Jones did an enormous amount of work towards the development of English wood-carving. In All Souls College at Oxford he had seen the original sketches the architect had made for carving there. Certainly Inigo Jones did more than write the word "carving" on his drawings. The speaker said he had understood that the carver had then a free hand in his work, but on examining the drawings it was astonishing to see the amount of detail that Inigo Jones had put into them. Sometimes it was said Wren started the English school of carving, but in the light of facts the speaker believed Inigo Jones exercised an earlier influence on the art.

Mr. J. D. CRACE said he agreed with Mr. Martyn that Grinling Gibbons became valuable to architects at the time he came under the direction of Wren. Gibbons's work subjected to such restraint and influence was valuable to the building.

The CHAIRMAN put the vote of thanks to the meeting, and the two lecturers having replied, the evening terminated.

RHIND LECTURES.

THE Rhind Lectures in Archæology for 1906 are to be delivered by Dr. F. Haverfield, Hon. F.S.A.Scot., of Christ Church, Oxford, the subject being "Roman Britain."

Dr. Haverfield devoted his opening lecture, says the *Scotsman*, to an explanation of the general character of a Roman province, such as Britain. He observed that it might sound a truism to say that all historical and archæological facts must be explained in harmony with their environments. Yet the truism was often ignored. We recognised, indeed, that a new find, be it large or small, or a fort or a fibula, a dwelling-house or a coin, could not be properly criticised without a knowledge of the circumstances in which it was discovered and the other objects discovered with it. We did not so readily recognise another sort of environment. This was the whole historical framework within which our new find lay. This framework provided us with a number of antecedent necessities and probabilities which we could neglect only at our peril. Suppose, for instance, we were told that a Roman fort had been found on a hill-top where no ordinary Roman fort could naturally have stood, or that an Italian fibula of the sixth century B.C. had occurred among remains of the Imperial period, or that a Roman villa had been unearthed in the north of England or the south of Scotland. In such and many other cases we should need to reflect that antecedent knowledge opposed the tale. It might be that our antecedent knowledge was wrong and required adjustment. It might be also that an abnormal accident had confronted us. But it might also be that our fort was not a real fort, or our fibula was not a true relic of antiquity, or our villa no country house, but an officers' casino. In any case, we must compare our new find with our general knowledge and correct the one by the other. This was the reason why he had thought it well to commence a course of lectures on Roman Britain by the preliminary consideration of what a Roman province generally was—what elements we might expect to find in it, what kind of civilisation, what manner of military occupation. We were apt, in dealing with the subject of Britain, to be influenced by other considerations—by our school recollections of Cæsar and Tacitus, or by our notions of our own Indian empire.

What, then, was a Roman province? We could sketch its chief features in a few words. It was an area of conquered territory outside of Italy ruled by a governor supreme both as civil judge and military commander. The Government, however, was in reality the least important element in the province. It was small in number—the governor himself and a staff, a few financial officials and in some cases, but not in all, a body of troops. These represented the Imperial authority. But they were not necessarily Romans in the sense of being Italian born or resident in Italy. The number of Italian officials in any province must have varied, but it could never have been great. It might often have amounted to two or three dozen. The rest of the officials and troops might have been, and indeed probably were, provincials, and the bulk of them might never have seen Italy. Moreover, this official body did not really govern. It only supervised. The real rule lay with the local authorities. These might vary. But we could discern three units, all of which occurred commonly. First, the town organised on the Italian municipal system, and established with a special charter and special privileges, and a territory around it. Secondly, the Imperial domain, managed by Imperial finance officers. And thirdly, the great area of native local organisations, differing in every different district—in the one cantons, in the other native towns, both ruled by the native nobles or magistrates. In the Roman Empire Home Rule was applied freely and fully. These were the elements of the province. But provinces differed. Those of the Eastern Empire were Greek or Oriental lands, full of ancient civilisations. There the Empire was little more than a military occupation. But in the West the populations were akin to the Latin, and were also uncivilised. They were capable of receiving not only Roman rule, but also Roman culture, and they actually received it. Here we touched the true work of the Empire—the Romanisation of the western provinces. It was within the limits of this Romanisation that we must attempt to fix our views of Roman Britain.

Let them examine the conditions more closely. The races of the West were white, by origin probably akin to the Italian, and capable of assimilation. We had not to deal, as we might in Roman Egypt, or to-day in British India, with subject populations sundered for ever from their rulers by a physiological abyss. Nor had we to deal as we might in Finland or Bosnia or Poland to-day with a civilised race conscious of its own identity, sullenly resenting the dominion of another kindred race. The result was that the western provinces became Roman in a very real sense. They spoke and thought and lived as Romans. The outward fabric of their lives and the linguistic fabric of their thoughts were alike Italian. We could not in these provinces speak of a "departure of the Romans" as we might in India to-day. The departure of the Romans would have meant the departure of the provincials themselves: a civilisation which was a mixture of Hellenic traditions with Roman ideas spread over all the western provinces, and covered them with a uniform culture. In this culture there was no originality—only conventional imitation. It was, at its worst, mere automatic copying. But two elements contributed differentiation between one province and another. Nationality was perhaps indestructible. Certainly it was capable of surviving in strange and secret forms when political independence had long ceased. In the Empire it lasted not in opposition to the Roman civilisation, but in union with it. It brought into the provincial culture native gods and native elements. These were not conceived as national and anti-Roman, but coloured the Romanisation; and often one felt that after all the old nationality was not dead, but was capable of a sort of resurrection if only events favoured it strongly enough.

The lecture was illustrated with lantern views of Roman African buildings in Timgad, Thysdrus, &c.; Roman Gallic buildings in Nimes, St. Rémy, Luynes, Reims, &c.; Roman Gallic sculpture in Nimeguen and Lens; and monuments representing native religious worships in Roman Africa and Gaul.

Dr. Haverfield in his second lecture treated of the history of the conquest of Britain. He said if it was one glory of the Roman Empire that it used its peace well in Romanising its subjects, it was scarcely a less glory that it knew how to obtain that peace by guarding its frontiers and by scientific fortification. The early Empire gave little

Digitized by Google

sign of such an achievement. The first Emperor Augustus contented himself with an inadequate army—mainly for financial reasons—and was in consequence driven to various political compromises. But he laid the foundations of the Imperial military system. This system rested on certain fixed principles. First, tactically the army was a heavy infantry force. It contained cavalry regiments; but its foot soldiers were more numerous and more important, and, except in chance frontier fights, decided the issue of battle far more often than the mounted men or archers. Secondly, it was a long-service army. Men were recruited for twenty or twenty-five years. At the end they received bounties or grants of land or homes in provincial municipalities, with the Roman political franchise, supposing they did not already possess it. Thirdly, it was a garrison army. Fourthly, it was a fixed or permanent army. Its units were kept for years, and indeed for centuries, together in the same quarters. Regiment did not relieve regiment according to some regular rotation.

Fifthly, it was posted almost entirely on the frontiers or in disturbed districts. In Gaul, for instance, there were practically no troops. One regiment, rather gendarmerie than regular troops, kept order in the great commercial capital at Lyons. All the remaining troops were concentrated in small or large permanent forts along the German frontier of the Rhine valley. In fact, the Romans adopted the policy which we had recently introduced in India. Till two or three years ago our garrisons were scattered over the land from the Hindoo Koosh to Cape Comorin. Now they were being gathered up into the point of danger, the frontier which faced unquiet hillmen and the chances of Russian invaders. In addition to these general characteristics the regular army was divided into two sharply distinguished grades. If we excluded the favoured prætorians and various local militias as exceptional in one direction or the other, we were left with two kinds of troops, known as legions and auxiliaries. We habitually used the term "legions" as if it were synonymous with the whole army. That was not the case. In many districts of military occupation, as, for example, in Northern Britain, legionaries only appeared at crises when campaigns had to be carried through, serious invasions repelled, or extensive fortifications erected. The rest of the work was done there by the auxiliaries who were recruited from the subjects, not the citizens of Rome, from provincial hill tribes and natural warriors.

In an army of this description, that was intended for permanent garrison work, a special interest attached to the fortifications, the permanent homes of the troops. They had seen that the troops were principally of two kinds. They should find that, with the exceptions due to every rule, the forts were equally of two kinds. One class was the legionary fortress of some 50 acres, accommodating an entire legion with its servants, &c. The other was the auxiliary fort, varying in size from 3 to 8 acres, according, they might suppose, to the regiment for which it was first constructed. For obviously a totally different space would be needed for a foot regiment of 500 and a horse regiment of 1,000. In general one fort went to one regiment, but there were also smaller block-houses, and sometimes larger forts of 10 or 15 acres. These two classes of forts were in general so posted that the legionary fortresses formed strategic centres on or near the frontiers, while the auxiliary forts actually lined the boundary, defended important points along roads, and coerced difficult hill tribes. Few specimens of the legionary fortresses had yet been excavated. Of the three instances in Britain only the outlines were known, but of the auxiliary forts numerous specimens were existing.

In the third lecture, it was said that Julius Cæsar had profoundly affected British education by supplying a text-book for beginners. He did far less to influence early British history. His famous invasions were not conquests. They were punitive raids intended to teach the Britons that Rome was formidable. Still, two results followed his work. The suzerainty which he established over the south-east was, like most suzerainties, a mere name. But it contained a germ of the idea of conquest, and the actual conquest of northern Gaul which he did effect brought Britain into closer relations with the Empire, and helped to civilise and even to Romanise it. After Cæsar followed nearly 100 years' inaction. The conquest was definitely undertaken only in 43 by Claudius. The reasons for it were disputed. Two that were often given seemed inadequate. The mineral wealth of the land, mostly lead and iron, was too little to promote land-grabbing. The Druids were no longer a danger, if they had ever been, to the peace of the Gaul. More probably we might assign it to the coincidence of two facts. First, before 43, the friend of Rome and leading chief, Cunobelin (Cymbeline in Shakespeare), had died, and his sons were anti-Roman. At the same moment there developed in Rome itself a forward policy. In several regions we found annexations, conversions of suzerainties into definite provinces, and the like, which showed that about 41-6 the ministers of Claudius were both able and aggressive.

The earlier history of the conquest could not be traced in detail. But we could see that by 47 the Romans had overrun all the south and south-east and Midlands—that was, all the lowland region, which offered no natural obstacle to conquest. It appeared, further, that the conquest was made by three forces acting independently though in concert. The troops landed in the three ports of early Kent—Dover, Lymne and Richborough—moved on London and thence on Colchester, capital of the house of Cunobelin. Thence they advanced in three divisions. The second legion, under Vespasian, went along the region south of the Thames so far as Exeter. The ninth legion moved up the east coast to Lincoln and the Humber. The twenty-fourth and twentieth formed the centre, and went north-west towards Shrewsbury and Chester. Then, probably, were laid out the great Roman roads of the English Midlands, which run west, north-west and north from London and Colchester. So far the Roman course had been easy; now difficulties hemmed it in. In front were the hills of Wales and of northern England, tangled, precipitous, impenetrable, and inhabited by fierce warriors. Behind were the conquered Britons of the lowlands, some of them doubtless friendly to their conquerors, but many of them reflecting, as conquered peoples did, on the evils of conquest. These evils were not overcome for thirty years. It was not till 80 that the Britons began to accept Roman civilisation gladly, and that the hills of Wales and north England were conquered.

Then the advance into Scotland began. This advance, under Agricola (about 80-5 A.D.), was, he thought, temporary in its character and devoid of serious results. They had various small clues to indicate that it principally proceeded up the west coast from Chester to Carlisle and Birrenswark, and they knew that it left its traces on the line between Forth and Clyde. Domitian stopped the advance. His Government, like the central Government of other Empires at other times, interfered with what they would call colonial freedom of advance and cried halt. It was an unusual word in Roman government, and it was interesting to notice that it was precisely a weak emperor who cried it. Of the forty years between 85 and 125 they knew next to nothing. But we could see that Agricola had not done his work thoroughly. Somewhere about 120 or 115 came a rising of the conquered hill tribes. They had not been immortalised in poetry like their predecessors in the Lowlands, Boadicea and her Iceni ans. But they annihilated a legion, drew Hadrian himself to Britain and caused the erection of the Hadrian wall. That was not the end of the tale. Early in the reign of Pius Antoninus the wall of Antonine was built (142). Late in the reign of Antoninus (158) there was a revolt of the Brigantes, which spread from Peak to Cheviot and left its usual mark alike at Birrens and near Buxton. But practically the erection of the wall of Hadrian marked the establishment of a definite frontier. The lecturer then showed a number of slides illustrating portions of the wall, its forts, vallum, turrets, &c. He pointed out that at first it had been built by Hadrian in turf, and reconstructed by Severus in stone. Further slides were shown illustrating points at which two periods of building could be detected.

The Report of the general examining board of the Scottish Ordained Surveyors states that two preliminary examinations took place last year. Twelve candidates were presented, and of these six passed in all subjects, four failed in one subject and two failed in two subjects. In addition to the candidates who passed the examination four apprentices were allowed exemption in one or more subjects on production of the leaving certificate or other equivalent certificate. Two diets of the final examination were held. At the April examination one candidate came forward and failed in both divisions. At the October diet one candidate failed in the first division, and another passed in the second division. Attention is drawn to the insufficient preparation shown by the candidates in the subjects of land surveying and levelling.

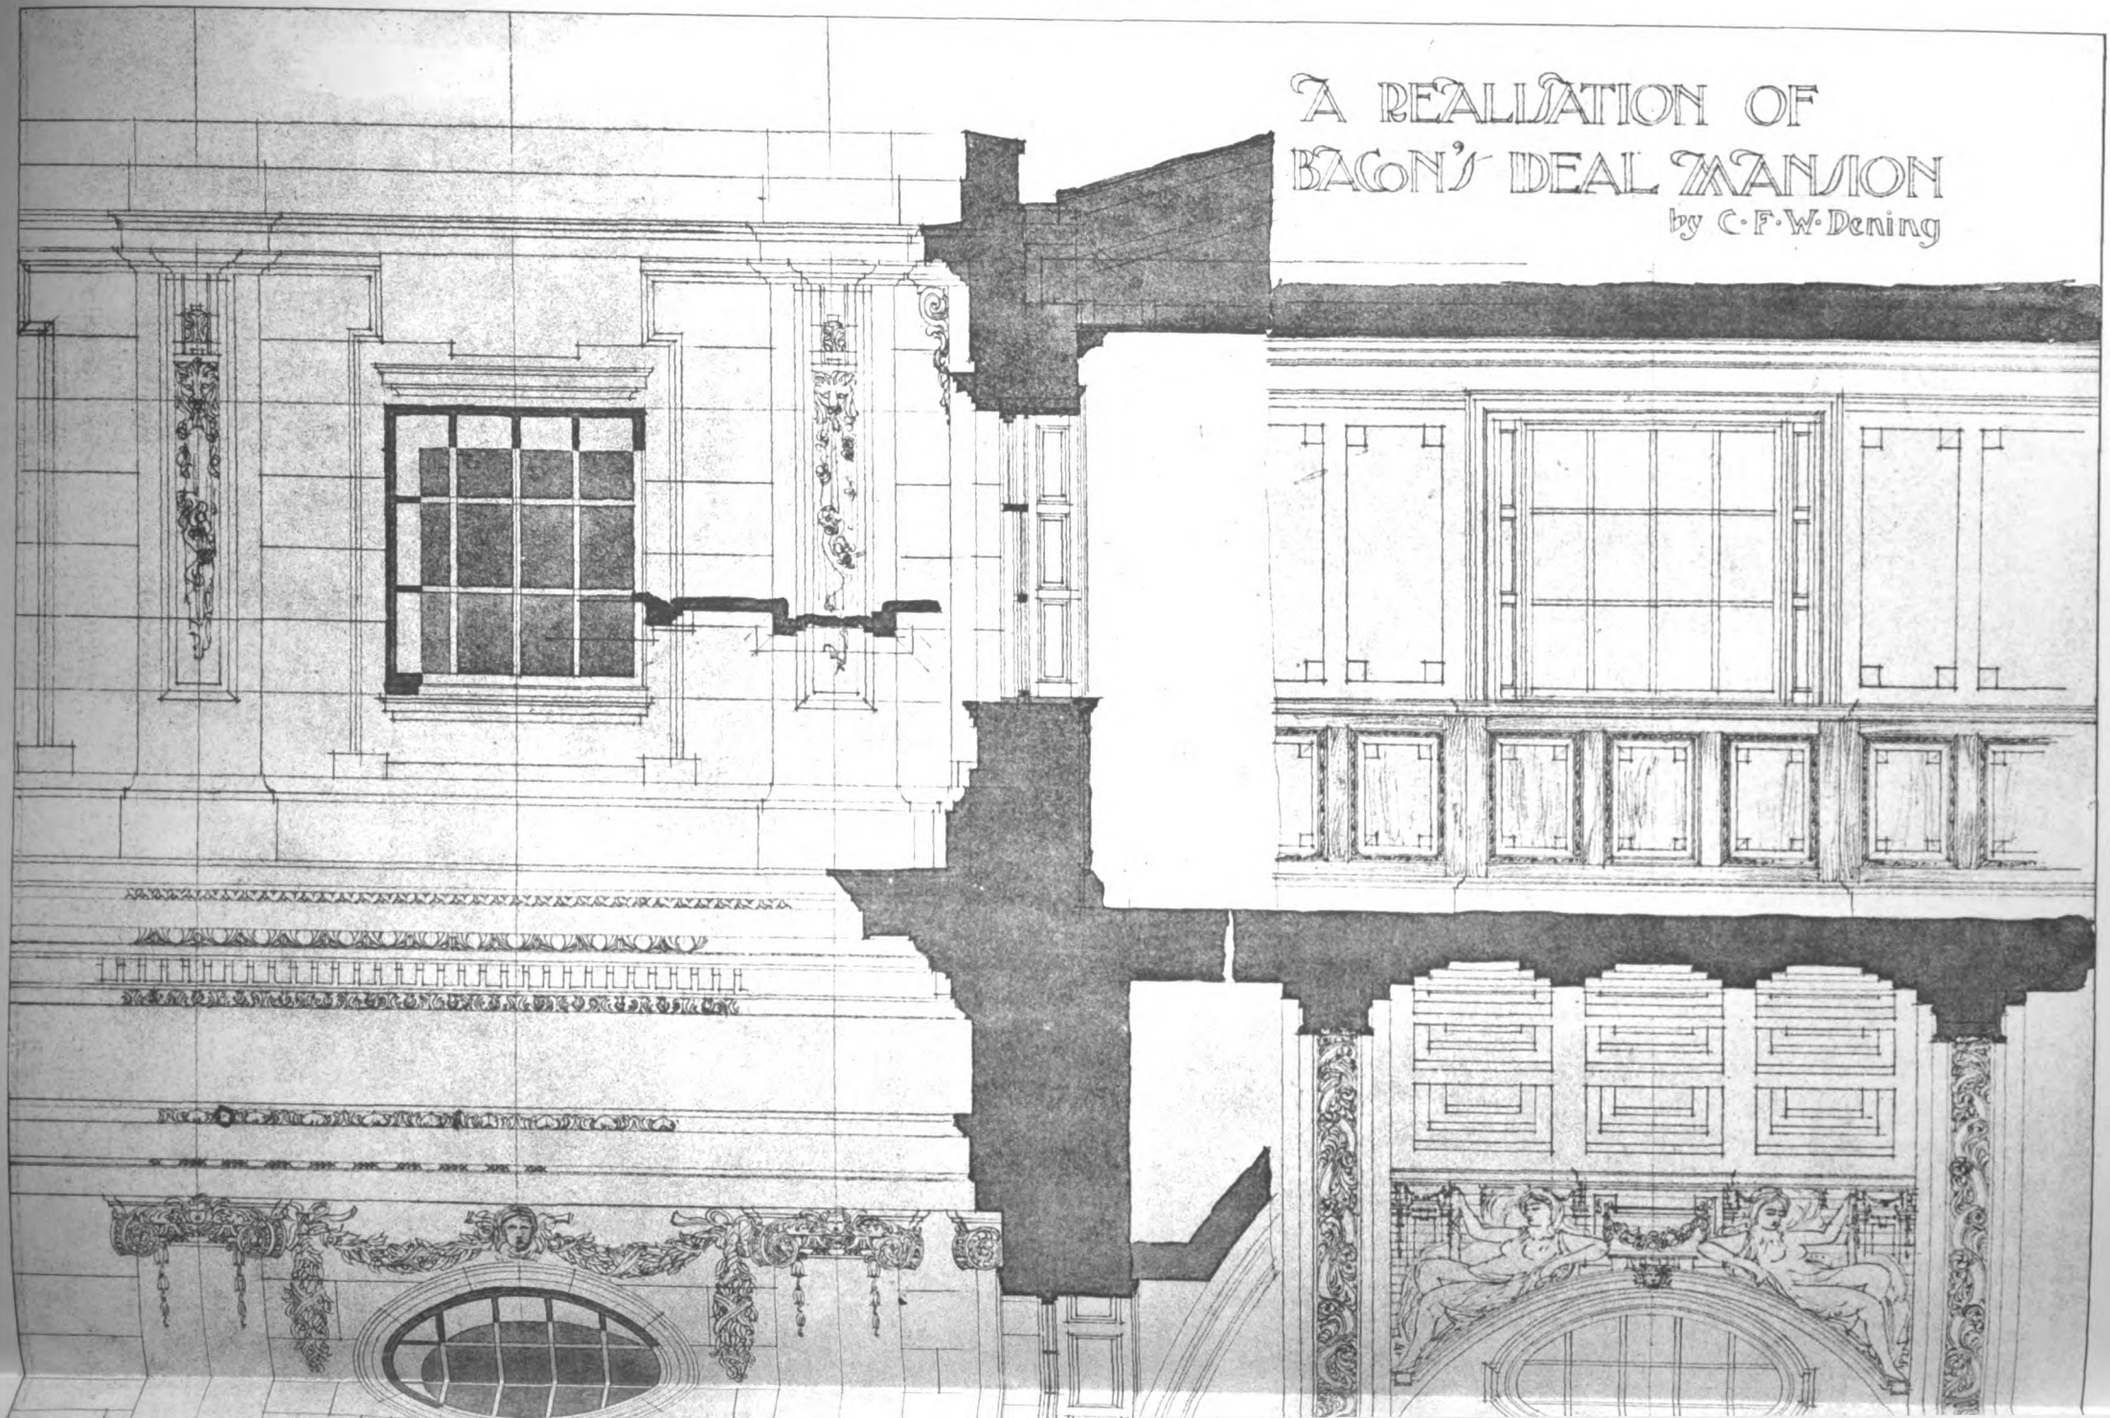
NOTES AND COMMENTS.

THE French, as everyone knows, are sticklers for classification. The Government have had lately to consider an important question of that kind. It relates to the Grand and Petit Trianon, two palaces which are familiar to all visitors to Versailles. The names are derived from Triarnum, which was the name of the parish. LOUIS XIV. had built there, from the designs of MANSART, a house of refuge for himself to which he could retire when bored by State ceremonies. The question which lately had to be decided was whether the Trianons were to be considered as palaces or as museums. The majority of visitors would be likely to say that the difference was of no greater importance than that between Tweedledum and Tweedledee. It only requires the stroke of a pen for a royal palace or a noble's château to become a museum. In fact, it may be said that France has ceased to have palaces. That was the view taken of the matter by those who were called upon to investigate, for they have decided that henceforth the Trianons which hitherto formed a palace are to be recognised as museums and nothing more. The royal founder of the two, we may assume, will not be much troubled by the change, and it will make not the least difference to the humblest visitor. One department gains the responsibility which another has lost.

THE maxims of "Poor Richard" about the advantages of thrift, which are the best known of the writings of BENJAMIN FRANKLIN, have given an erroneous notion of the character of a great statesman. The United States owe their independence mainly to WASHINGTON and to FRANKLIN. One was a country gentleman who employed his leisure as a land surveyor. The other, after a short period in his father's chandlery, became apprentice to his brother as a printer. As a compositor he worked for two years in London. On his return to America he purchased a small newspaper. When he was elected to Congress he proposed a system of colonial defence which was approved by his countrymen, but was rejected by the English representative officials. He was then appointed as agent to London, and his mission was on the whole successful. He was opposed to the French holding Canada and advocated war, but when it was proposed to ask his fellow colonists to pay part of the 73,000,000*l.* expended on the war with France he was one of the first to object. He obtained the repeal of the obnoxious Stamp Act, by which the money was to be raised. At a subsequent period he failed in his opposition to the proposals to levy duties on tea and paper. When the war which followed began he was one of the five who drew up the Declaration of Independence. Afterwards he went as agent to Paris to solicit the support of LOUIS XVI., and took up his quarters in Passy, in a house which is still standing. The French did not remember that one time he was opposed to them. They were attracted by his discoveries in electricity, and his quakerism in dress and manner fascinated people who were becoming wearied with the courtly splendour which they believed was impoverishing them. More portraits of FRANKLIN were to be seen in Paris than of the king. In 1778 he was able to negotiate the treaty by which the States were recognised as an independent nation, while until the close of the war with England he persuaded France to advance large sums to its protégés. FRANKLIN'S reputation remains unstained; the French Government and the Municipality of Paris were therefore right in accepting Mr. HARJES'S offer of a replica of the statue of FRANKLIN by JOHN BOYLE, which stands in Philadelphia. The memorial is to be inaugurated on the 20th inst. The site is near the Trocadéro Museum, and will be in a line with the street which bears the name of the man who was the first ambassador from the United States to France. On the pedestal, which was designed by Mr. CHARLES KNIGHT, are inscribed MIRABEAU'S words:—"Le génie qui affranchit l'Amérique et versa sur l'Europe des torrents de lumière. Le sage que deux mondes réclament."

PEOPLE often point to the resemblance between the Madeleine and the Palais-Bourbon, or the Chamber of Deputies, as evidence of the tact which is exercised in laying out long thoroughfares in Paris. The spectator can see that the view is terminated at both ends by a Classic building, each having a pediment and several columns to support it. For a long time the Palais-Bourbon has been supposed to be too small, and from time to time we hear that it is about to be reconstructed. It appears that one of the latest proposals is to remove the Classic façade, while another idea is to bring it nearer to the quay. If once taken down we may assume that it will never be set up, for it will be replaced by something in a later style. In that case, as the French are strong in logic, there is little doubt that the front of the Madeleine would be transformed in order to agree with the secular front. Of course, Frenchmen must have their revolutions, and it may be wiser to operate on buildings than on citizens.

DOMENICO VENEZIANO was, if we believe VASARI, a victim to the progress of painting. He worked with ANDREA DEL CASTAGNO in Florence, and discovered the secret of oil-painting, which in the early part of the fifteenth century was eagerly sought. CASTAGNO was said to have murdered him. Recent investigation has demonstrated that there is no ground for the calumny. VENEZIANO is on other accounts an interesting painter, but nothing is known about the date of his birth or his training. He appears to have worked in several of the Italian cities. A fresco of his which was exposed to the weather for centuries came into the possession of the Earl of CRAWFORD AND BALCARRES. According to the report of the trustees of the National Gallery, this picture was transferred from the wall to canvas in Italy in 1851 and presented to the collection in 1886. Over a year ago, however, it was found that the state of the picture threatened its immediate destruction, and it was hoped that the mischief might be arrested by relining. But the pigment was falling from the plaster ground in such a way that relining, which would affect only the adherence of the ground to the canvas backing, was useless, and the very reluctant recourse was had to the process of transferring the picture itself to canvas, and this was not altogether successful. Without extensive repainting it would hardly be intelligible to the ordinary visitor. When it is remembered how few are the paintings which can be ascribed to the painter, the loss of the fresco is to be regretted.



IN Germany, as in all countries where militarism is supreme, questions of degree, precedence, order, &c., assume an importance which can hardly be realised in Great Britain. That fact explains the anger which lately prevailed in the Society of Berlin Architects over the arrangement of names on a tablet. A new theatre has just been completed in Düsseldorf, and, as often occurs of late years, a tablet was set up in which the names of the builders took precedence of the name of the architect, Herr SEHRING. He brought the case before the Society, when, as we have said, the members became angry over what they considered was an insult to the profession. It was resolved that a deputation of the Society should interview the chairman of the company owning the theatre. It has been decided that a new tablet is to be set up in the vestibule, and in it the architect's name will come before the names of the contractors. Berlin architects must be happy when they have no greater grievances to encounter.

WOOLWICH TOWN HALL: COMMITTEE SUITE OF ROOMS.

WE have already published a view of the exterior of the town hall, which is near a group of other public buildings in Woolwich. We now give a plate showing the suite of committee-rooms which occupy one end of the building on the first floor. The central committee-room is a domed apartment 34 feet long by 22 feet wide, and is divided from the two adjoining committee-rooms by movable screens, by the raising of which a reception-room is formed, 60 feet long by 30 feet wide, suitable for mayoral and other functions. The wall panelling and the columned screens are in wainscot oak, and the ceiling is enriched with modelled plasterwork. The windows overlooking Wellington Street are filled with stained glass. The inscription under the central window is as follows:—"Here at Eltham Palace in Epiphany-tide of 1364, King EDWARD III. entertained with great splendour three noble kings, viz. JOHN of France, DAVID BRUCE of Scotland and WALDEMAR of Denmark." The window in the room on the left commemorates Sir THOMAS MORE, Lord Chancellor under HENRY VIII., who was executed in 1535. His daughter MARGARET was his devoted companion in adversity and his favourite child. She rebuilt Well Hall, Eltham, in 1568. The inscriptions are:—"Sir THOMAS MORE, author of 'Utopia,' friend of ERASMUS and HOLBEIN, lived as Lord Chancellor of England at Eltham. He excelled in

sacred learning and was courageous of the truth, suffering death at the hands of his King." "MARGARET, a pious and learned woman, the beloved daughter of Sir THOMAS MORE and wife of WILLIAM ROPER, of Well Hall, Eltham, was the cheer and comfort of her father during his imprisonment, as his letters testify to this day." In the right window are shown the portraits of the Master Shipwright of Woolwich, PHINEAS PETT, and SAMUEL PEPYS, who occupied a residence at Woolwich. According to the inscriptions, "PHINEAS PETT, the first Master of the Shipwrights' Company, designed and built many great ships at Woolwich for the King's Navy. Being maliciously accused of incompetency in building the 'Prince Royal,' he was tried by his Royal Master, King JAMES himself, who graciously acquitted him." "SAMUEL PEPYS, the famous diarist, who for some time lived in Woolwich, was a most helpful official at the Admiralty during a critical period in our Navy's history." The mayor's reception-room adjoins the committee-rooms, and is 30 feet by 20 feet. It is panelled in oak and has a columned oak window-screen which, with the doorways, is enriched with carving in the manner of GRINLING GIBBONS. The window is dedicated to Sir MARTIN BOWES, Lord Mayor of London in 1545, who lived in Woolwich. The architect of the building is Mr. A. BRUMWELL THOMAS.

CATHEDRAL SERIES.—TRURO: WEST FRONT.—SOUTH PORCH.

A REALISATION OF BACON'S IDEAL MANSION.

THE design which we publish to-day is based upon the principles of "a perfect palace" as laid down by BACON in his essay on building. The whole plan is 400 feet from front to back, grouped around an outward and inward court. The first or principal floor shows the general arrangement of the "two several sides." "A side for the banquet, as is spoken of in the Book of ESTHER, and a side for the household. The one for feasts and triumphs and the other for dwelling." The banquet side occupies the front and return to the left of the principal entrance, and consists of the banqueting-hall, sculpture and picture galleries, and beyond, surrounding the inward court, the privy galleries and an infirmary, "if the prince or any special person should be sick." To the left is the hall and chapel, with the summer and winter parlours and reception and retiring-rooms. A feature has been made of the grand staircase, which is semicircular on plan; and great attention has been paid to the central axial line enabling long and pleasing vistas to be obtained. The dignity and impressions of a palatial residence suggested the Renaissance style being adopted. The drawings were submitted in the recent competition at the Royal Institute of British Architects for the Soane medallion, by Mr. C. F. W. DENING, Bristol.

ROMNEY AND PETWORTH.

A SHORT time ago, in connection with the resurrected Turners, attention was drawn to the great landscapist's close association with Petworth. Among the art treasures of Petworth House, and one of the chief of them as far as money worth is concerned, says the *Sussex Daily News*, is a family group by the eighteenth-century portraitist, George Romney, who "divided the town" with Reynolds, when Johnson and Garrick, Gainsborough and many another "immortal" were moving figures in the life of the time. Hayley, whose home was at Eartham, and who wrote the "Life" of Romney, which has of late years become an object of quest among book-collectors, tells us that for long prior to 1795 it had been an object of Romney's ambition to place some work of his in the princely mansion of Petworth. Lord Egremont resolved to employ him on a large family picture. Not only so, but he determined to indulge his wish to execute the work in his favourite painting-room at Eartham. For this purpose Romney visited Sussex in the autumn of 1795. The issue was the famous Egremont family piece, No. 381 in the catalogue of pictures in Petworth House, showing a lady, in the character of Titania, with her four children as fairies, shooting at bats with bows and arrows. The reclining lady is on the Petworth catalogue said to be Elizabeth, Countess of Egremont, and the children, Colonel Wyndham, General Wyndham, Lady Burrell and Mrs. King. Probably the 250 guineas paid to Romney for this group is one of the highest sums he ever received for a single canvas. In early days, about 1767, he got 7 guineas for a three-quarter portrait, 30 by 25 inches, which rose by various stages to 35 guineas in 1793. His highest price for an ordinary full-length, 93 inches by 57 inches, was 150 guineas. By 1772, however, he was earning 1,200*l.* a year; by 1785 thrice as much. As an indication of how enormously pictures by him have risen in money worth during the last few decades, it may be said that his celebrated portrait of Lady Hamilton as Nature, which changed hands for 50 guineas in 1816, has recently gone out of this country for not far short of 20,000*l.*

It is understood that it was Sir Walter Armstrong, director of the National Gallery of Ireland, who identified as a study for the picture at Petworth a canvas which was picked up somewhere in the neighbourhood of Midhurst and now forms part of the admirable collection of Mrs. Bischoffsheim. One of the chief differences between the Petworth picture and the study for it is that the lady in the latter is not a portrait but a fancy figure. Hayley gives us an interesting account of the group and Lord Egremont's approval of it. In a letter to his son, written on October 4, 1795, Hayley says:—

"Pray tell our dear Romney, with my love to him, that his fair friend of Petworth spoke yesterday in the most pleasing terms of the family picture, with a lively solicitude for its being happily finished, and in such a manner as to suit the convenience and gratify the feelings of the artist in every respect."

Again:—

"His (Romney's) spirits were elevated by the applauded completion of his magnificent picture, the family at Petworth, which was now finished in the painting-room at Eartham, as the party attended him very graciously for the purpose. . . . Towards the end of September the trio of friends enjoyed a sort of triumphal delight in seeing the production of Romney's pencil, which he had so fervently wished to place as a monument of his genius in the mansion of Petworth, suspended there with splendid effect and the most friendly applause."

As to the identity of the lady in the picture, though several writers have assumed she was Lady Egremont, there was no Lady or Countess of Egremont when the portrait group was painted, nor was the nobleman who commissioned Romney ever married.

The "find" near Midhurst of a study for the famous picture recalls how rather more than half a century ago a Mr. Tomlinson, of Whitehaven, at an unimportant sale of household effects, gave under 2*l.* for a picture of a little girl carrying a doll, and her brother, toy gun in hand, with which were thrown in two full lengths of a man and a woman, now attributed to Tilly Kettle. Mr. Tomlinson, who was an ardent collector of all kinds of things, contended throughout that the group of the boy and girl was by Romney. It is said that many offers of considerable amounts were made to him, but he always refused to sell. On December 3, 1904, the picture came up for the verdict of the auction-room in London, and made no less than 6,500 guineas, the other two full-lengths, perhaps not by Tilly Kettle at all, bringing the amount up to 7,082*l.* 15*s.* This was a fairly good return for an outlay of less than two sovereigns.

Again and again during the last few years pictures for which Romney himself received only a few pounds have made thousands. His "record" in the sale-rooms stands at 10,500 guineas, paid in 1896 for the famous group of Viscountess Clifden and Lady Spencer, 56½ inches by 72½ inches, for which he himself received 80 guineas, in 1791, or so. That picture is now worth a great deal more. The same sum was paid in 1902 for "Miss Sarah Rodbard," another of Romney's 80-guinea canvases. Then in 1900 "Charlotte Pierse," 63 inches by 47 inches, fetched 7,000 guineas (original price 60 guineas); "Mrs. Dorothy Crespigny," 50 inches by 40 inches, 5,600 guineas in 1901 (original price 40 guineas); while "Lady Hamilton as Circe," 93 inches by 58 inches, jumped from 14½ guineas in 1807 to 3,850 guineas in 1890. Lady Hamilton—Romney's "Divine Lady," the "sun of his hemisphere"—was again and again painted by him in all kinds of attitudes and impersonating all kinds of characters embodying all kinds of qualities. The discovered study for the Petworth picture is to be seen in "Georgian England" exhibition at the Whitechapel Art Gallery.

THE YEOMAN'S HOUSE IN ENGLAND.*

(Concluded from last week.)

TILES were not generally used in England until the seventeenth century, owing to the scarcity of coal and the difficulty of burning them. For the same reason bricks were not employed extensively for building before Henry VIII.'s reign, though, of course, the art of brick-making, so commonly used by the Romans, was never lost in England. Formerly bricks were much thinner than they are at present, and there was little to distinguish them from tiles. The old red tiles we find on the roofs of these buildings are thicker and more unevenly burnt than our modern ones of to-day; they were, of course, all made by hand, and the holes for the pegs or nails were not so accurately placed, and being hung on oak riven laths instead of sawn straight ones, the irregularity of the tiling and the texture of the surface produces a softness and delicate play of light and shade that is very pleasing. This effect can be seen on the roof of the cottage at Mayfield. Thatched roofs, which are probably a survival of the earliest form of roof covering, are frequently met with, and here the hip treatment is even more prevalent than with the tiled ones. I have some examples from Brook Thorpe and Leonard Stanley, all in Gloucestershire, and showing the traditional gables. There is no doubt that these old houses gather a great deal of their charm and simple picturesqueness from the fact that the roofs are so unbroken in their surface and treatment, and though the little use to which the space inside was devoted and the apparent wastefulness of their construction would appal the modern builder, yet it is this evident disregard of economy that makes them so effective.

Quite apart from anything else, a roof of high pitch gives a character and dignity to the building it covers which is distinctly pleasing. The roofs of all these old houses are so satisfactory as they seem to grow naturally from the walls below, and whether of stone, tile or thatch, being of the local materials makes them seem part of the actual landscape. The cottages at Bearsted in Kent, Lower Bush and Elmstone all show this, and I also show you an example from Normandy.

At this point a few words may not be out of place with regard to these timber-built houses. Broadly speaking, as they resemble each other to a certain degree in plan and elevation, so they do in their construction, which is simple in the extreme, and, though doubtless well known to architects, some account of it may be of interest to those who have not analysed the ingenious method of their framing.

The plan was first set out, and a base or foundation wall built, generally of brick or stone, high enough to keep the wood all well above the ground, as at Boughton, in Kent. Into this cill-piece heavy storey posts of timber were fixed upright about 7 or 8 feet apart, those at the angles being larger and formed of the butt of a tree placed root upwards, with the top part curving diagonally outwards to carry the angle-posts of the upper storey, as shown in the view of Stone Hill Farm, Chiddingly, where also the typical Sussex stone slates can be seen. Upon these main posts beams were laid across the building, projecting forward some 18 inches in front of the framing below; into these beams others were connected longitudinally, and to these again the floor joists were tenoned, projecting the same distance as the main beams. The framing of the upper storey then followed that of the ground floor, excepting that the plate or cill was now laid on the ends of the overhanging timbers. In the sixteenth century the ends of the joists were often covered with a richly moulded (and carved, as at Lenham) fascia; but later this was abandoned, and the ends of the joists were merely rounded off.

The projecting storeys of these timber houses, which with their quaint and decorated fronts and many gables are so beautiful, were not born of a mere freak or an artist's fancy. They were copied from the town houses, and these overhanging stones were intended for use, namely, to give shelter from the sun or rain to the stalls and books and to the goods displayed in the streets; and though there was no actual need in the country for such projections, the custom was adopted until it became almost traditional.

The house in its first stage was a mere timber skeleton or "carcass," as it was then called, and until the framing was well advanced had to be stayed or propped up from the outside—the slots to receive these stays are still showing in the larger timbers of many of the houses. The spaces between these main uprights were then filled with windows or timber framing, the latter generally about 8 or 9 inches apart, the closeness of the timbering being an indication of early work, and it was not until later that they were set further apart and curved and shaped braces introduced.

Though the general character and appearance of these Kent and Sussex houses bears some resemblance to those of Shropshire and Cheshire and the West of England, the elaborate panels, filled with curved braces and cusping, so typical of the latter districts, are seldom seen in Kent, though there is a somewhat isolated example at Mayfield, in Sussex. These were contrived by using the bent and twisted pieces of wood obtained from the smaller branches and fitting them into the panels formed of the upright and cross rails. It has been suggested that the prevalence of this kind of ornament was due to the shape the trees assumed from the force of the wind which is so frequent in the West of England, and which bent and distorted the trees and so supplied many more crooked than straight branches. I have some typical examples from Little Moreton Hall, Cheshire.

These houses were chiefly built of oak, which generally shrinks, and as their construction depends in great measure upon the security of their mortises and tenons, when the joints shrank apart or decayed and the buildings settled they were, in order to keep out the weather, either plastered all over on the outside, hung with tiles or covered with deal boarding—indeed, very many of the tile-hung houses one sees throughout Sussex are the old sixteenth-century timber-framed ones in a new shell, as at Goudhurst, in Kent. The windows, as a rule, in the timber houses were small, with moulded frames and mullions and filled with lead lattice glazing. Sometimes they were treated as oriels, swung forward on richly-moulded sills supported by cut and shaped brackets. An effective arrangement was to place a bay window carried out on the first floor only, as at Chiddingstone, but more frequently taken up from the ground and under a gable which projected forward and overhung it, as at Beckley. The large boards and finials to these gables were always decoratively treated and many still remain. At first they were merely stout boards cusped or shaped at the edges and later ornamented with perforated tracery and carving, as at Eynsford and Cranbrook; a beautiful example is still to be seen in the High Street at Burford, in Oxfordshire.

Turning again to the stone districts we find the walls of the houses always built of stone never less than 18 inches and often considerably more than 2 feet in thickness; they are built of either rubble in thin layers, or in deeper courses of dressed stone, or in larger blocks of dressed stone, the character of the walling depending in great measure upon the way in which the stone comes from the quarry. In Wales and Westmoreland the nature of the stone is reflected in the walling, as at Plas Mawr and Ambleside.

In the seventeenth century the employment of the stone lintel was universal, and one is struck by the almost entire absence of the arch in these buildings—externally the openings were never made wider than the stone would carry, and stout oak beams were laid across the door and window opening inside.

The four-centred door head out of one stone is the commonest treatment, at first steep in outline as at Laverton, then shallower, until eventually it became the flat lintel. Occasionally the doorways were sheltered with a projecting hood on moulded brackets as at Chalford Hill, but in the stone districts a point to be noticed is the absence of porches so common in the timbered houses.

Now the doorway, or entrance, has always been the centre of attraction, and that upon which the best workmanship is most often found, for if there be no ornament anywhere else it is generally here that some effort was made. It was always in the doorways, fireplaces and memorial tombs in the churches that the old builders tried to exercise their ingenuity and originality, and where you will notice the influence of change of style and fashion, as at the Warren Farm. The proportion of the doorway also greatly affects its character, a wide and low opening conveying a sense of welcome and comfort that is seldom obtained by a tall and narrow one. In the timber houses the porch was always made an interesting feature, and the examples from Luntley, Shropshire, Handforth Hall and Cheadle, and the old school-house at Webley, are very typical and characteristic.

The windows, again, were always stone mullioned, filled with lead-latticed panes and wrought-iron casements, and

* A paper by Mr. E. Guy Dawber, F.R.I.B.A., read at Carpenters' Hall on the 15th ult.

Digitized by Google

whether in stone or wood were nearly always treated in the same way, 12 to 16 inches wide between the mullions, and in the small houses we are dealing with seldom more than one light high. The number of lights in nearly every instance diminishes in each succeeding storey. On the ground floor the windows have four or sometimes six lights, with a heavier central mullion, the next storey will have three and in the gable will be two. It was the invariable practice to lessen the number of lights as the windows ascend into the gables. The reason for this may have been owing to the dearness of glass in the sixteenth and seventeenth centuries, which in these small houses would doubtless govern the size of the windows, those in the living rooms being generally the largest. Indeed, the smaller the window, as a rule, the older the house. Before the time of Henry VIII. glass windows were rare except in churches and important houses, and when it eventually became cheaper the fashion arose of making the windows as numerous and large as possible.

The symmetrical disposition and squareness of the plans and the way in which they were roofed enabled the windows to be easily arranged to come centrally under a gable in every case (as at Tocknells and Whittington), a treatment also met with in the timber and brick built houses.

In the stone houses the windows are always placed on the outer face of the wall, so that inside the deep recess gives that delightful sense of comfort and warmth only obtainable when thick walls are used. Bay windows are not of very frequent occurrence in these small houses, but in the towns and villages they were sometimes used with very happy effect, as at Duddington, in Northants. Where the frontage to the street was very narrow, the entrance was placed in the centre with a bay window on either side, terminating in gables above, as at the Swan inn at Lechlade in Wilts, and at Campden in Gloucestershire, where we find an almost similar treatment, but without the bay windows. No description of the windows would be complete without speaking of the dormers, the most characteristic feature of these stone houses. Their origin, which is very simple, arose in the following manner :—The buildings were generally roofed about 12 or 15 feet above the ground, or some 4 feet above the bedroom floor. This did not give sufficient height for the windows to be placed under the eaves, and as the bedrooms were always constructed partly in the roof, it was necessary to carry up the side wall and form smaller gables with windows in them, which thus became dormers, as at Saintbury. The lead-latticed glazing of all these houses forms quite an integral part of their construction, and the mullioned window without its accompanying small panes of glass is but a sorry sight.

In the early houses we find the panes based upon a variation of the diamond and the square, sometimes very small and intricate, but always such as the village glazier could cut and put together. Towards the close of the seventeenth century the rectangular oblong panes became very popular and continued down to the end of the eighteenth century with but little change. The leading of the small panes of glass enabled the texture of the masonry walls to be carried, as it were, through the windows without a break, getting a continuity of surface that is very pleasing and which these old builders thoroughly appreciated, as at Broadway. The mistake so often made to-day is in glazing windows with a single sheet of glass, producing a cold effect inside and breaking up the exterior with cavernous spots of black and emphasising the openings in a manner which was never intended. In these houses the rooms were generally about 7 or 8 feet high, or even less, for so long as a man of average height could walk about without knocking his head against the ceiling every one was satisfied.

In many of the houses one or more of the rooms have the open-beamed ceilings richly moulded and sometimes carved, but as time went on this delightful treatment died out and square beams and joists were used, to be finally superseded by the plain plaster ceilings. The main beams were often placed in the rooms without the least regard to the position of the windows and fireplaces over which they happened to come; indeed, to this may be attributed the loss of so many old houses by fire, for the modern grates burning coal put into the old openings set fire to the beams built into the chimneys.

Occasionally we find the ceilings richly modelled in plaster, with finely panelled rooms and decorated fireplaces, but, as a rule, in the houses we have been dealing with they are not frequent. The workmanship of everything, however plain and simple, inside the houses was thoroughly honest and good. It seemed to be an axiom that every house, irrespective of its size, should contain some work of interest and charm, and whether in the wrought-iron hinges to the doors or fasteners to the casement windows, the individuality of the craftsman shows itself and stamps his work with vitality and interest.

In these yeomen's houses the work was all done by local men with native home-grown material. They were compelled to rely upon their own natural resources, and, as their intercourse with the outside world was limited, the builders for years handed on the same methods until eventually they became almost traditional. But although all these houses were built on well-recognised principles, yet we may traverse England from end to end and not find two houses exactly alike, and it is this infinite diversity of form and variety of treatment that makes these houses stand out so pre-eminently as a phase of domestic architecture.

If we turn to the house at Aston Subedge, in Gloucestershire, we find it consists of one simple parallelogram—the main doorway in the centre with two rooms immediately to the right and left of it, and staircase by the chimney in the middle of the house. The house is now used as the village school, and its interior is altered by partitions, but the original plan is reflected in the elevation, which shows a roof unbroken from end to end, with the exception of the two dormers over the entrance doorway and the window beside it.

The farmhouse at Willersey has a somewhat similar plan with a series of windows carried up as dormers into the roof above, all thoroughly well balanced and giving to the exterior a clue to the arrangement of the rooms within; the heights and widths of the windows and the disposal of the gables leave nothing to be desired, and the whole composition, free from any striving after effect, is an example of simple direct building and a lesson in the sensible use of material.

In these cosmopolitan days the use of railways and easy means of transit have almost obliterated the older crafts, and the advent of bricks and mortar, cheap foreign timber, blue slates and corrugated iron is very rapidly driving the local materials and methods of building out of use. This cannot be sufficiently deplored, for, apart from its effect upon the employment of labour, it is a matter of serious import that the old handicrafts that made this country so pre-eminently beautiful are dying out. The total lack of encouragement given to workers in these simple trades and the introduction of methods of building quite at variance with those indigenous to the country, combined with the enforcement of restrictive building by-laws, are bound in the course of a few years to have a disastrous effect, even if they have not done so already.

In the districts with which we have been dealing it is now a rare occurrence to find new houses built with local materials and in the old manner, and, if they are so, it is chiefly by people who have at heart the old traditions and dislike new and strange innovations.

Again, the building by-laws which have been in use for many years past have been responsible for the decline of much local building and tradition. In the districts where these restrictions are in force not one of the houses which I have shown you would be allowed to be built to-day, for in some way or other they all transgress the regulations laid down by our wiseacres.

By-laws for towns and cities and crowded districts are essential as safeguards for the welfare of the general community, but that a man who builds a house to-day away in the country should not be allowed if he wishes to put thatch on his roof, should be compelled to make his rooms so high and his windows so large that no fire can warm them, should have to use only certain materials and only in certain ways, is a grandmotherly interference with the liberty of the individual, for which there can be no possible excuse.

We are apt to forget that it is in these villages that our country life is written, and that the sturdy yeomen who built these houses and quarried the stone and cut the timber with their own hands formed a national and distinct style of architecture.

And, in conclusion, is it out of place to raise a plea on behalf of these eloquent though silent witnesses to the craftsmanship of our village ancestors, and to urge that those who have the care or reparation of old cottages and farmhouses should treat them with a gentle hand and more tender regard? Unfortunately, many are being swept away, and the dwellings of our forefathers, so closely inter-

Digitized by Google

woven with the life and history of the country, and possessing such an intensely human interest, are being rapidly destroyed in some cases to make way for what can be regarded as but doubtful improvements.

Go where we will and contemplate any old building untouched by the hand of the restorer, and it is impossible not to be impressed by its beauty and subtle charm—the mullioned windows and latticed panes, the roofs a kaleidoscope of varied colours, the venerable walls covered with lichens, the absence of any meretricious or unnecessary ornament and the wonderful feeling of homeliness that pervades every feature—all combine to produce the essence of simple and beautiful architecture.

I would not suggest that, merely for the sake of their antiquity or picturesqueness, unhealthy or insanitary houses should be retained, but I would most strongly urge that where it is possible to save them we should hesitate before breaking any of the few remaining links that bind the villages and country towns of to-day with the interests and associations of the past.

On the motion of Viscount Dillon, who presided on the occasion, a hearty vote of thanks was accorded to Mr. E. Guy Dawber for his excellent lecture and series of beautiful views, which would be an encouragement to study the domestic architecture of our country, and to the Master and Wardens of the Carpenters' Company for the use of the hall. A vote of thanks was also tendered to Viscount Dillon for taking the chair.

ART IN PAINTING AND PHOTOGRAPHY.*

A SHORT time ago I received a newspaper cutting from a friend of mine, who knew I was to have the pleasure of addressing you this evening on the subjects of painting and photography. The paragraph it contained was evidently part of a correspondence being conducted in the paper on what were considered to be the rival claims of painting and photography as the exponents of art. The discussion apparently had taken the turn of weighing the claims of the two exponents, who figured in the letter under the title of "The Man with a Conception" and "The Camera Man." As the argument progressed, and the *pros* and *cons* were given, one read of the ultimate triumph of "The Camera Man" and of the eventual downfall to ignominy of "The Man with a Conception," who would no doubt, it was politely intimated, "finally disappear."

Reference to a matter of comparatively such small importance as this letter may appear to be slight foundation for a paper concerning our subject, but there is, unfortunately, a good deal being said and printed of a like nature in connection with it, which is only of a mischief-breeding character, that can be for no good, and frequently drags men of repute into an idle argument which they presently regret having embarked upon. Now I submit that all such discussions are irrelevant, and are but a waste of time, for it is foolish to spend energy in disputing who is going to do a thing best while the time so employed might be given to the subject itself. The study of art is the object of both fraternities, and whether the man devoted to that object elects to work with the palette or the camera, he must remember that he is engaged upon the study of a serious and beautiful subject, and realise the fact that its followers have far more to gain by working in unity than they could every achieve by disputing on the way. If the art of futurity is to be produced by the camera, well and good; let us be thankful to know that the future will contain art. But if such be the case, that the camera be the instrument of it, it will still require to be handled by a man with conception, for, as we know, art is found only in the personality of the individual and does not depend upon any special apparatus. In the meantime let all followers of art assist each other, for it is a profession which enjoys the dignity of standing by itself, in this kingdom, without assistance, and with not too much of encouragement, for the spirit of the age is a commercial one, and the public moneys are utilised by the State for the construction of huge engines of war for the protection and development of this spirit, leaving the gentler arts of peace to shift for themselves.

Art itself at the present day, or, perhaps, rather pictorial art, is in a somewhat eruptive condition, and it might be advantageous for us to give a short time to its consideration. Periodically, for all time, the art of painting has been subject to the vigorous action taken by groups of strong men who have felt called upon to assert their independent views, and to act in concert in supporting them. These groups of men have always been so vital in their work, and have so tenaciously adhered to their aims, that in course of time they attain to the dignity of being entitled "schools." The particular individuality of each of these schools is always associated with the emphatic insistence upon one or other of the canons of art at the expense of the remainder, either forcible dwelling upon the quality of detail alone, or tone, colour, light and shade, or general effect. There are those among us who can remember the appearance of schools affecting all these features, back to the "pre-Raphaelite" body, whose passion was excessive detail. These movements are generally well timed, and indeed may be considered to be the natural outcome of their age, the calling attention to some weak point in the art of the period; and even if, in the enthusiasm of the quest, its votaries outstrip the bounds of moderation, the gain to the common cause is great.

The movement of the present day we are all familiar with, under the title of "Impressionism." Impressionism differs from the schools that have preceded it in the fact that it makes no effort in the direction of adding to the existing practice of painting. On the contrary, it subtracts a good deal from it. It contents itself with a memorandum of the effect, and avoids the risk of contending with other qualities. The principal notes are struck, and left, without any graduation or attempt at delicacy or detail; the resulting effort, regarded as a picture, stops short just where difficulty begins—that of showing knowledge and management in the more subtle passages of the painter's art. The canvases are really beginnings of pictures, left in the state which has been known from all time among painters as the "laying in" stage. The facility of execution which this class of work offers the painter is necessarily effective decoratively; and a certain number of imitators, captivated by its facility and novelty, are following the lead given, as other men have followed other leads—mistaking a part for the whole—and they will have the misfortune of leaving no art legacy behind them. But the sobering influence of time in all these cases is the healer, and though in the course of nature the dying out of the school of the day makes room for that of the next, the good which is found in them is duly gathered by and incorporated into the beautiful things we know as art. So those of us who aspire to know of art in its larger sense must put ourselves outside the influences of these factions as sole teachers and turn to the truly great achievements of the past. As form is undoubtedly the greatest and strongest element in art, so is the sculpture of ancient Greece the finest art the world has ever seen or may see. What has been lost to us in the destruction of the paintings of this period we shall never know, but we have the masterpieces of the Italian, Spanish and Dutch schools for our guides. The great elements of the work of these masters appeal alike to the painter and photographer; the same lessons in strenuous constructive lines, masses of light and shade and harmony of colour.

Apart from these giants in art of the past, we have more modern painters, men of our own time and country, whose work is worthy of ranking with the highest. It is not the fashion just now to dilate upon the work of those three great painters of our English school, George Mason, Frederick Walker and Sir John Millais, but their position is an undying one, and to them mainly the modern art of this country owes its glorious heritage of colour, which not long since made English art respected throughout the world. This legacy has been neglected of late years, and has suffered from the imitations of foreign methods, which have unfortunately tainted the inspirations of many men whose pride it should have been to uphold the reputation of what can almost be considered a trust left in their charge. Let us strive at all events to be original, not alone in a national sense, but as applied to the individual. No man yet obtained the respect of his fellows by founding himself upon another. It is so easy a thing and so poor a thing to be an echo.

Modern photography has every reason to be warmly congratulated upon the great strides it has made, not only in matters pertaining to its scientific side, but also in the more important one of artistic quality. In the pictures of landscape we have a simple rendering of nature without any desire to dress it up or prettify it, which is most healthful. The coming to the front of this appreciation of simple dignified subject matter is a striking feature in the advance of late years. Landscape photography of this order is the outcome of the most careful study, for the inexorable lines

* A paper by Mr. J. C. Dollman, A.R.W.S., read before the Society of Arts on the 7th ult.

Digitized by Google

of nature cannot be moved, and any incongruity can only be circumvented by discriminating choice of the point of sight. Sometimes this has not been overcome, because, apparently, it could not be overcome while retaining some important feature necessary to the picture. The difficulty of control of the subject is, doubtless, the stumbling-block in the way of landscape photography; but when we remember that these very many fine things have been produced under hampering restriction, the prospect of what might be possible in directions where the artist had greater facilities is of the utmost interest. The representations we have of studies of the sea are very impressive, particularly those which are not too sharp in their definition, and where the sense of movement has not been checked by a metallic crispness. In these we can estimate the beauty of the drawing seen in tumbling water and the character and form of the masses of flying spray. Some of these breaking seas are splendid things. Many of the scenes showing the effect of evening are pleasing enough, though the prevailing tendency is to indulge somewhat too freely in indistinctness of focus, or some granular process is employed in the making of the prints, which invests the entire picture with the same quality. Nature always has a decisive note somewhere, of more or less emphasis. The work done in the direction of interiors is, with the facilities offered by the use of modern apparatus, most perfect as a record of the image before it. The figure subjects that one sees are fewer in number than the landscapes, but are perhaps the more attractive in one sense, for the photographer has greater responsibility here in his personal conception and arrangement of them, and his capacity as an artist is more directly brought before us. Many of these subjects are excellent, and some contain aims of a high order which would seem to forecast the future of photography. For this is the direction in which the art ought to be strong enough to assert itself, where it can dominate its subject and invest it with the creative.

In the commercial world photography is playing a strong part for the publishers, and in the direction of illustrated journalism there is no doubt that it is doing a useful thing. I think that we must all admit that the *bona fide* character of a photographic picture, which illustrates a topical subject, is one of far greater interest than the one of idealised treatment which we were familiar with in the past. We are bound to respect such pictures as fact, as true representations of the incidents depicted, which is exactly what is wanted for the purpose. We want in such cases to know what the incident was like, not what another man thought it was like. These matters, however, do not pertain to art, though there is one phase of such photographic work which has done an immense service to the world, and that is, it has enabled those who live thousands of miles away to have a complete image of people and countries they may never hope to see personally. Photography has practically brought to every country a true picture of all others. To science, as well as art, this is a great gift, not to mention the unspeakable interest to many thousands of families who are scattered widely apart. This is the great feather in the cap of photography.

One of the reasons of the greatness of art in the past is found in the fact that people lived in times when they were surrounded by the beautiful to a far greater extent than at the present day, and they became so familiar with it that a high standard of appreciation was reached not only by the exponents of art, but by the public itself. In Greece the human figure was, of course, the dominant influence, in Italy the fine personality and grandeur of costume, in Holland and Spain the characteristic and the picturesque. Modern life cannot permit these surroundings, but the representations of such things hanging upon the wall, as painted by the great men of those times, produced an instructive influence which should be found in all establishments devoted to art. I am, unfortunately, rather ignorant of the methods of education which prevail among photographic societies, and my knowledge of photography of to-day is founded to a great extent upon the exhibitions of pictures that are seen annually on view in London. The scientific side of the subject evidently is well provided for, but one often wonders whether there is a course of training in art pursued in the societies independently of the use of the camera itself. The student in painting is for some years occupied in schools of art or the studios of painters learning not only his craftsmanship, but educating his taste and forming his standard of beauty in the study of the fine examples of art he finds placed before him. The importance of this can be hardly over-estimated. A man's cultured taste is not born with him. He, of course, may be born with a gift for art, but that gift is profitless unless it is educated and developed. Art is a most serious as well as a most beautiful study, and the student not only has to master the executive of his profession, whether with the palette or with the camera, but he has to learn to compare and mature his judgment to be able to select, for selection is the great principle of art. A landscape-painter who has been drilled in the schools can apply the principles he has mastered there to the real work of his life—landscape-painting—equally well with the man who intends to paint the figure. This would appear to be a vital element in the education of a student who is aspiring to produce works of art with the camera, for he, unlike the painter, has not the power of alteration or elimination when once the photographic plate is exposed. He therefore has to use the keenest judgment and taste in the preparation of his subject beforehand, which must necessarily be a most difficult thing to do, and will test his knowledge of art in a high degree. I am, of course, here alluding to the treatment of the figure subject, for with landscape the power of creation does not lend itself so freely to photography, and beyond the choice of point of sight and the waiting for the appearance of a satisfactory effect upon the scene, the scope afforded to the photographer for the exercise of the creative is limited by the intractability of his subject.

I do not know whether there exists such an institution as a photographic school for students to study from the living model, but such a school must undoubtedly prove of much value; and in the study of the works of masters, by grouping human figures with an exact fidelity to resemblance, pose, lighting, and detail to the original picture, under the tuition of a photographer who was a master of the art side of the matter, an opportunity of a most instructive nature would be found. If this idea should be new it may possibly not produce a favourable impression, for few innovations do. Personally, I believe that the greatest things that photography is going to do in the future will be associated with the figure; for, in connection with that, the photographer will have the best opportunity of developing and showing his creative power in art, and it is this very quality of the creative which is the charm. When we remember the exquisite modelling of flesh and the tenderness of tone which a good photograph can give, it seems a great loss that these qualities are not made available to the full extent. A student trained in art, working with fastidious care in selecting his model, and in conducting the whole operations, would, I am persuaded, if he was a man with an imagination, produce some photographic pictures which would cause a sensation. The actor's is an art—how much greater to make a figure so perfectly play a part that the resulting study should be received as a great picture. Beautiful as quantities of the landscapes are which are seen in photographic exhibitions, they are the art imitative compared with the results which are possible in this direction at the hands of the right man. If the day should come when a man with the conception and insight of our painter, G. F. Watts, and who combines that power with a photographic executive of the greatness of Mrs. Margaret Cameron's, the world will then see for the first time what it is possible for photography to achieve.

But the pursuit of pure art is a thorny path to tread, and if a poor man essays to venture his fate in this direction he must do so prepared to lead a life of stern self-denial and extreme patience. Even then he may have to contend not only with vicissitude, but with actual want; for recognition even of a truly distinguished man comes sometimes so late in life as to be valueless to him. A sadder case of this kind it is difficult to quote than the Frenchman, J. F. Millet, the painter of "The Angelus." As there may be some present who are not acquainted with the struggle this eminent man had, perhaps a few facts from his life may be enlightening. The extracts are from Millet's life by his friend Sensier, which is to be found in Vol. XX. of *Scribner's Monthly*. Sensier relates how Millet, though leading the simple life of a peasant, could barely obtain the necessaries of life for his family, and this was mainly done by his painting signboards for a few francs each, struggling to pay off his debts to the local tradesmen for their daily food. "Amidst these miseries," says Sensier, "his head always ill, and disquiet and fear always following him, Millet painted his most beautiful works—'The Gleaners,' 'The Angelus' and 'Waiting.'"

"The Angelus" was painted in 1859, and sent to Paris,

Digitized by Google

where it lay two months without an offer being made for it. This year he writes to Sensier :—

"It is frightful to be stripped naked before such people, not so much for one's pride, which of course suffers, as because it is impossible to get what we need. We have wood for only one or two days, and we do not know how to get it, as they will not give it to us without money. I am suffering and sad. Forgive me for telling you these things. I do not pretend to be more unfortunate than a lot of other people, but each feels his own pain. . . . I am working on the drawings of Alfred Feydeau, whose money I beg you to send as soon as you get it, for the children cannot be without a fire. Try, my dear Sensier, to coin some money with my pictures; sell them at any price, but send me one hundred francs, fifty, or even thirty."

Thirty francs—twenty-five shillings.

This was the year he painted "The Angelus." He died, as Sensier says, "killed before his time by the endless battles in which his strength could not but fail." This is, I am afraid, very gloomy reading, but it is far from counting as the solitary instance of the world's greatest treasures being wrung from suffering humanity. It is an account which does not apparently encourage a novice to try his fortune in the same direction. But to such a man as this work was more important than life, and the world reaps the benefit, however much it may commiserate the sufferings of his family and himself.

I should like to make a few remarks upon one or two subjects, as a painter, though the subject-matter is more or less photographic. The first of these is what is called "Instantaneous Photography." Some time ago we had a visit paid to this country by a lecturer whose wonderful photographs of moving animals immediately arrested the attention of artists of all kinds. If the lecturer had contented himself with his own department, the photographic analysis of the movement of animals, all would have been well, but he demonstrated by single records of action, that is to say, the action that is found in the 1-500th part of a second, that the movement shown in the pictures of animals by Landseer, by Rosa Bonheur and others was incorrect. This is another example of mistaking a part for the whole. It is the object of art, in representing movement, to communicate to the senses of the spectator the sensation of movement as it appears to the human eye, and not as it appears to a photographic lens worked by a shutter at 1-500th part of a second. For instance, if a cart-wheel, revolving quickly, is photographed by such a quick apparatus the resulting picture conveys the idea of a wheel at rest, for every spoke and detail is sharply defined. But contrast with this the conventional way of drawing a wheel revolving, a circle with a few irregular radiating lines proceeding from its centre, and you at once get the sentiment of motion. This is art. The other is mechanics. When the series of pictures was shown one at a time the quaint and extraordinary action of the horses provoked the audiences to amusement; yet when they were shown in quick rotation in the biograph, and gave in their combination the suggestion of action which the human eye can appreciate, the applause of the spectators testified their pleasure. This is to be said of all representations of movement by art—that they shall convey only to the eye what the eye is limited to seeing. Analytical demonstration beyond this steps out of the domain of art into that of science. It is the duty of art to represent the typical and not the exceptional. Please do not gather from this that I am not alive to the intense interest which subjects taken with the hand camera always possess. The photographs so taken must certainly appeal to every lover of nature—if they have had enough exposure.

Another subject I should like to dwell upon is the photographic portrait, taken direct, on a fairly large scale. These portraits sometimes have a certain quality about them which prevents them being accepted as successful likenesses, although the expression is admitted to be natural and the features individually faithful in identity. Now I would submit the opinion that this is the result of the camera being brought too close to the subject, and therefore exaggerating the perspective view of the face. While the human vision consists as it does of the combined images of the two eyes, the vision of the camera depends upon its single lens; and though a perfectly satisfactory image can be obtained at a certain distance by the two human eyes, because from their different positions they are able to look more or less round the sides of an object, the camera lens has but one point of sight, and from the same distance would yield a very different image, because it does not see round the sides of the object. This leads to undue prominence being given to the nose and front planes of the face. As an illustration of what is meant let us suppose a view taken of the front face of a human head as a model, so close to it that the ears would not be seen by the photographic lens, as they would lie behind the projecting cheeks of the face. The two human eyes at the same distance from the face of the model would see a portion of the ears, because from their two points of sight they would see round the cheeks of the model to some extent. The point of sight therefore for the photographic lens to be placed, to obtain the same view as that of human vision, is at the apex of the cone of rays which includes the visual angles of the two human eyes. The stereoscopic camera, with its twin lenses placed apart as human eyes are, would obtain the same view of the model as the human vision—that is to say, the combination of its two pictures would give the same view. This illustration is, of course, a much exaggerated one, but portraiture is such a subtle thing that the slightest variation in the proportion of the features is to be guarded against as a disturbing influence, and this difference between the human vision and what we may call that of the camera should be remembered at all points of sight.

The other subject I will touch upon before concluding is that of diffused light seen in the interiors of buildings. Photographers have a wholesome dread of the quality which is called "halation," and while it certainly is an eyesore to see the tracery of a window obliterated by a flood of bright light, I really think it is quite as uncomfortable to have the detail of a window sharply picked out like the working drawing of an architect. The effect of diffused light about the interior of a cathedral is a most poetic element, and is one which some of our great interior painters have seized upon to construct their pictures with. Perhaps a medium course between the two extremes would be the safest one to adopt. At all events, if the photographer wants to make a picture, and not a portrait, of an interior, let him avail himself of this opportunity of obtaining such beautiful gradation of tone as the occasion offers.

It is this very quality of luminous haze that was so largely employed by Turner in the beautiful sunset scenes of his, in which he deliberately introduced the sun itself, and made magnificent use of the play of light upon the atmosphere, in managing the effect of his picture. It is well to speak of this great man Turner as an "Impressionist," for that he most certainly was in the fullest sense, for he conveyed not only a most gorgeous impression of the effect of the scene represented, but also the detailed impression of the most infinite number of subtle gradations in the beautiful tones of distances, from the delicate film of the extreme horizon to the strong and full-blooded modelling of the foreground of his picture.

I have tried to discuss our subject by a high standard, which is the only one possible to take with the question of art, and it is the standard that all serious aspirants have to abide by in our profession.

It is a beautiful profession, and is, to a great extent, like virtue, its own reward. All that we, the members of it, can do, in its furtherance, is to strive to hold the mirror up to nature; to tell the truth, the whole truth, and nothing but the truth.

Correspondence

The Liverpool Reredos.

Sir,—In an article in *The Architect* of March 23 on the proposed reredos at Liverpool, the comments on the comparatively late dates of the Ascension as a subject in Christian art, and its unfitness for a reredos, especially in sculpture, appear to have a solid foundation. The reredos itself is, however, a comparatively modern ornament, especially in England, and the Crucifixion in a reredos is by no means common here. At the moment I do not remember if in the Jesse Tree at Christchurch, Hants, one of the most beautiful reredoses we have, the Crucifixion is inserted. The only example I can specially remember is at Winchester.

The proper place for the crucifix is, of course, the rood screen, or the entrance to the chancel, excepting the small one on the altar.

To a certain extent the Bishop of Liverpool is right. The Church is triumphant, and as art emerged from its

Digitized by Google

swaddling clothes, even in the catacombs Our Lord in Majesty, seated or standing, is a dominant subject. We may take, as examples, that in the catacombs of SS. Peter and Marcellinus, of the sixth century, in which Our Lord is sitting, and those in the cemetery of Generosa and in SS. John and Paul, in which He is standing. Even in the earlier paintings of the Crucifixion at the back of altars Our Lord is vested in the colobium with the laticlava, reigning from the Cross; to wit, those in the cemetery St. Valentine, SS. John and Paul, and in S. Maria Antiqua. On the other hand, the bishop appears to have overlooked the fact that since Christianity has conquered and the Church has reigned, the Crucifixion has been nearly always placed at the entrance to the sanctuary, as well as in it, on the altar.

Perhaps, however, the very object of placing the Crucifixion on the altar or behind it, to signify that the Eucharistic sacrifice is a continuation of the Sacrifice on the Cross, is really the point of the objection after all.

But why sculptured reredoses, those awful collectors of dust and dirt, especially in smoky localities?—Yours,

W.

GENERAL.

Mr. John Belcher, P.R.I.B.A., has selected, at the request of the St. Pancras Borough Council, for a limited competition for new central library the following architects:—Mr. Maurice B. Adams, Mr. J. S. Gibson, Messrs. Mallows & Cross, Messrs. Russell & Cooper, Messrs. Wills & Anderson and Mr. E. Wimperis.

Mr. William Boulton, C.E., late burgh surveyor of Aberdeen, died on Monday. Mr. Boulton, who retired in 1892 after twenty-two years' service to the Corporation, was in his eighty-sixth year.

The Forty-sixth Annual Dinner of King's College will be held at the Hôtel Cecil on Monday, May 7. Mr. Justice Grantham will take the chair.

Mr. Ernest Runtz read a paper last week before the South Wales Architectural Society at Cardiff on "Hostelries, Ancient and Modern."

The Egyptian Government have granted to the Liverpool Institute of Archæology, through the hon. secretary, Mr. J. Garstang, a concession to make excavations on the famous site of Abydos, in Upper Egypt. There has been a considerable amount of rivalry among scientific explorers who were also desirous of excavating there.

The Society of German Engineers, the Verein Deutscher Ingenieure, will hold a congress in Berlin from June 10 to June 14 to commemorate its jubilee. The present membership is more than 20,000.

Mr. Asquith, in a printed reply to Mr. Napier, M.P., says that His Majesty's Government regrets that there is no prospect of the extension of the National Gallery, asked for by the trustees of that gallery, being carried out in the approaching financial year, as it has not been possible to make provision for it in the Estimates. The question will be further considered in the course of the ensuing financial year.

The London County Council decided on Tuesday that the new park at Denmark Hill, which is about to be laid out, should be called "Ruskin Park," in view of the fact that John Ruskin lived in the immediate vicinity.

The St. Petersburg Society of Civil Engineers have received instructions about the preparation of designs for a building in which the Duma—the visionary council—is to legislate for the Empire.

Mr. W. R. H. Chipperfield, town surveyor of Ladysmith, and formerly surveyor and engineer to the Atherstone District Council, has died in Ladysmith. While out riding he was thrown from his horse, and sustained internal injuries to which he succumbed. During the time he held the appointment at Ladysmith Mr. Chipperfield carried out extensive schemes of sewerage and water supply.

The Abbey Church at Nuneaton, which was erected in 1160 and has since the Reformation fallen into ruins, is to be rebuilt at a cost of 14,000*l*. The new structure will be built as far as possible on the foundations of the old.

The Photographic Survey of Sussex, which has been established nearly two years, has dealt with thirty-nine sections (each measuring three miles by two miles), and has 685 photographs. It is desired to extend the work over the entire county.

A Special General Meeting of the Royal Institute of British Architects was held on the 3rd inst., when it was unanimously resolved that the general principles of the report and recommendations of the registration committee, dated March 20, 1906, be adopted and the details referred to the Council for further consideration and report to the general body. It was also resolved that the Council be requested to take the necessary steps, when the scheme is perfected and approved by the general body, to apply to His Majesty the King for a revised or supplemental charter and to prepare and present a Bill to Parliament.

The Greenwich Antiquarian Society have opened a fund to be devoted to carrying out the explorations in Greenwich Park. It is desired to determine if possible definitely the line of Watling Street, and to ascertain the object and perhaps the approximate date of the earthworks near the Vanbrugh park gate. These earthworks are marked in the Ordnance Survey of 1871.

The Court of Common Council have decided "that, having regard to the great popularity of the loan exhibitions in the Guildhall Art Gallery, it be referred to the library committee to consider and report as to the desirability of holding a loan exhibition of pictures in the Art Gallery in the summer of 1907, and the probable cost thereof."

The Huncoat (Lancashire) Parish Council has resolved to remove the village stocks into a prominent position, "in memory of the good old days when people were put in them."

The Committee of Selection of the Royal Academy for the present year consists of Mr. Ernest Crofts, Mr. Frank Dicksee, Mr. T. G. Jackson, Mr. David Murray, Mr. W. W. Ouless, Sir W. B. Richmond, Mr. J. S. Sargent, Mr. J. M. Swan, Mr. Hamo Thornycroft and Mr. W. F. Yeames, with the President as Chairman. The hangers will be the Keeper, Mr. Ernest Crofts, Mr. David Murray, Mr. John M. Swan, Mr. Ouless, Mr. Sargent and Sir W. B. Richmond.

The Council of the Royal Manchester Institution last week made the awards in the Heywood prize competitions in the Municipal School of Art for the sessions 1903-4 and 1904-5. For 1903-4 three sets of drawings were submitted, the subject being "The Decoration of a Ceiling to a Public Library." One prize of 10*l*. 10s. was awarded to Mr. Daly. For 1904-5 numerous sets of drawings and designs were submitted for "A Design for an Entrance-hall of a Large Secondary School." Prizes were awarded to Mr. R. Wallwork for a decorative scheme (10*l*. 10s.) and to Mr. J. Bluhm for an architectural scheme (10*l*. 10s.). It was reported that Miss Jessie Dawe, who recently gained the travelling studentship of 50 guineas offered by the Council, had begun her studies in Paris.

The Liverpool Architectural Society will hold their annual general meeting on the 11th inst. The Council have nominated Mr. Edmund Kirby as president; Mr. E. P. Hinde and Mr. A. Thornely as vice-presidents, and Mr. G. W. Fraser and Mr. E. C. Aldridge as honorary secretaries.

The Aberdeen Architectural Association held their first annual meeting on the 31st ult. Mr. G. J. Irvine, who was re-elected president, afterwards held a social gathering. There was on view a collection of architectural drawings lent for the occasion,

Mr. W. St. John Hope states that he believes that King John's treasure, which is believed to have included the Crown jewels, lost nearly 700 years ago, lies near Sutton Bridge, Lincolnshire. To help him in forming a correct idea Mr. Hope has worked out the tides right back to the day on which the occurrence took place, and also traced every step of King John. He suggests that shafts might be sunk to find the treasure.

The London County Council offer annually two prizes of the value of 15*l*. each, two of 10*l*. each and two of 5*l*. each for carefully executed drawings of buildings, churches, and of artistic objects in museums. They have received the report of the judges on the last competition, and are of opinion that the works submitted are not of a sufficiently high standard to justify the award of the two prizes of 15*l*. The four other prizes have been won by lady students at the Camden School of Art and the Camberwell School of Arts and Crafts.

A Paper, entitled "Technical Education in Architecture and the Building Trades," will be read by Mr. H. Davies, head of the Architectural and Building Trades Department, Northern Polytechnic, before the building section of the Association of Teachers in Technical Institutes on the 7th inst., at the Regent Street Polytechnic, W.C. All teachers of building and architectural subjects are invited.

The Architect.

THE WEEK.

Monday last was the centenary of the birth of Isambard Kingdom Brunel, who was undoubtedly one of the greatest engineers of the nineteenth century. He was born in Portsmouth, where his father was engaged in the carrying out the block machinery at the dockyard. As the son of a Frenchman, he spent from his fourteenth to his sixteenth year in Paris. In his seventeenth year he became assistant to his father, who was preparing preliminary plans for the construction of the Thames Tunnel. During the progress of the works he was resident engineer. His first work on his own account was the preparation of plans for a suspension bridge at Clifton. They were never realised, but the Hungerford Suspension Bridge, which he designed in 1842, was afterwards transferred to Clifton. When railway construction occupied more attention than any other kind of speculation, Brunel was fortunate in obtaining the appointment of chief engineer to the Great Western Railway Company. He adopted the broad gauge of 7 feet. There could be no question of the advantages it offered to travellers; but it was expensive, and in order to put an end to the isolation of their system the Great Western Company were compelled to adopt the narrow gauge. Brunel had a love of largeness in all things, and his *Great Western* steamship surpassed in size and power any vessel which was then afloat. His *Great Britain* steamer was still larger, and his *Great Eastern* exceeded both in its dimensions. It was in connection with the launching of the last that he was struck down by paralysis, from which he never recovered. He took recreation in kite flying, and one of his greatest pleasures was to lie on his back on his own property with a large cigar in his mouth watching the motion of a giant kite in the air. He also found pleasure in watching the growth of his tea plant. But he was always ready to employ his genius for the benefit of his country. This was shown by his zeal during the war with Russia in 1854-5.

An appeal has been made by the Society of Antiquaries to ecclesiastical authorities respecting the preservation of church plate. What is sought is to prevent the sale of plate which might be considered of no practical use, such as:—(1) Pieces of plate or other articles of a domestic character, not especially made, nor perhaps particularly well fitted, for the service of the church; (2) chalices, patens, flagons, or plate generally, made especially for ecclesiastical use, but now, for reasons of change of fashion, or from the articles themselves being worn out, no longer desired to be used. One instance of the risks which threaten ancient plate may be cited:—A church in Knightsbridge, lately removed, had among its plate a communion cup presented by Archbishop Laud. The new church built on another site is deemed to need some addition, and it is proposed to sell the communion cup to help in defraying the cost. A London dealer has offered 500 guineas for the cup, which itself presents no unusual features, and the high value is of course due to its historical associations alone. No public museum in this country is in a position to lay out so large a sum on such a purchase; the cup, therefore, will pass into private hands, not improbably out of England. It is pointed out that the property really belongs to the parishioners, and that the vicars and churchwardens are only temporarily in charge of it. Sales cannot take place unless there is a faculty in each case. And fortunately some Chancellors are opposed to parting with church property in any form. An excellent example has been set by the vicar and churchwardens of North Mimms, Herts, who have deposited in the British Museum an interesting but fragile amber tankard belonging to the church.

The late Sir Wyke Bayliss, who died suddenly on the 5th inst., in his seventy-first year, if not a great painter, deserves grateful remembrance from architects for the persistent zeal with which he represented buildings, and especially those of a Gothic type. His father was an engineer who afterwards devoted himself to teaching military and geometrical drawing. It was therefore to be expected that young Bayliss should at an early age have become acquainted with the production of geometrical representations, which some authorities consider to be the basis of the Fine Arts. He studied in the classes of Applied Art in Somerset House and Marlborough House, and afterwards became a student of the Royal Academy. He had also a short experience in an architect's office. He exhibited a view of "La Sainte Chapelle" at the Royal Academy in 1865, and two views of Trèves and Strasburg in 1879; but the majority of his works were seen at the exhibitions of the Royal Society of British Artists, which he joined in 1865. In 1888 he was elected president, and he seemed to be better adapted for the office than the mercurial Whistler, who held the position for a year. He was a writer as well as a painter, and among his books were "The Witness of Art," "The Higher Life in Art," "The Likeness of Christ Rex Regum," "The Enchanted Island" and "Five Great Painters of the Victorian Era." They were somewhat mystical; but what else was to be expected from a man who spent so much of his time in churches? Like David Roberts, he was always glad to suggest the performance of ecclesiastical functions in his buildings; and he often succeeded in representing rich vestments, coloured light and clouds of incense. As well as we can remember, he never attempted the representation of buildings which were not connected with Christianity.

It is satisfactory to learn that the works of reparation at Winchester will not require an outlay of 100,000*l.* as was reported. According to the Dean 30,000*l.* will be adequate to meet all expenses. It is believed, however, that the whole of the east end will have to be taken down, when the stones will be numbered and replaced. The difficulty with the foundations is caused by a bed of peat which lies over the gravel. If the material alone had to be removed the task would not be extraordinarily onerous. But inasmuch as the water continues to rise through the gravel the difficulties are magnified. It is believed that divers will be able to remove the peat, and then a bed of cement will be laid upon the gravel. When the underpinning is completed the building will be more stable than it was in Norman days, for it will stand for the first time on a solid foundation. All danger to visitors has been removed by the extent of scaffolding and shoring, and it is fortunate that the energetic measures have insured the stability of the cathedral.

The French publication, *L'Art*, has since 1901 adopted the practice of presenting admirable engravings and etchings as supplementary to those which appear in each number of the journal. Some English works have been comprised among them, such as Stanfield's "Tilbury Fort," Reynolds's "Lavinia Bingham," and Lavery's "Lawn-Tennis Party." But all subscribers to the excellent periodical may not have space available to hang those plates (some of which are large) or portfolios to contain them. It has therefore been arranged to issue *L'Art* under two conditions. The subscription for the monthly publication will henceforth be 25 francs in France and within the Postal Union, while for the numbers and the six additional plates the charge will be 50 francs. It is only necessary to glance at a single number in order to realise the value of *L'Art*, both for artists and lovers of art. Messrs. Hachette & Co. are the London agents.

POUSSIN v. LEMERCIER.

TOWARDS the end of 1642 a picture was produced in Paris which caused some commotion among artists. The title, in an abridged form, was *Time Delivering Truth from the Yoke of Hate and Envy*. In reality it was an act of vengeance on the part of Nicolas Poussin, the great painter, against Jacques Lemercier, who was at the time no less prominent as an architect. The picture still exists, and Barry considered it and the *Calumny* by Apelles, described by Lucian, as the only legitimate examples of allegory in painting.

A barren plain was shown by Poussin on which was erected a wretched barn or grange. It was supposed to be a sample of Lemercier's architectural work, and he was represented as the Queen of Stupidity, smiling with satisfaction and having for throne the back of the Flemish painter, Jacques Fouquières. One arm was around the neck of the long-eared artist, and beneath her feet were symbols of the arts. Fouquières appeared to be proud of his subjection, and he was adorned with a gold chain and a medal, on which his initials were engraved. Near the pair was a winged figure engaged in tearing architectural designs, including one by Poussin. Hercules, in the form of Poussin, was seen entering; his eyes were supposed to emit flashes of lightning, in his hands were thunderbolts. Looking on was Envy, that is to say, Simon Vouet the painter, who, realising the danger of his friends, attacked Hercules, tearing his cheek and lacerating his arm. Simon was more terrible than Medusa, and if it were not for a pair of protecting deities who were portraits of M. des Noyers, a minister of State, and M. de Chantelou, of the Department of Buildings, Poussin-Hercules would have a bad time during the encounter. They crown him with a great wreath of laurels, which for an artist's inward bruises is better than parmaceti.

Poussin at the time was nearly fifty years of age, and he was supposed to be foremost as "the painter of reason." But, with all his reason and stoicism, he could not be patient under what he imagined to be a wrong. He had prepared forty designs for a series of paintings in grisaille representing the *Labours of Hercules*, which were to be painted on the plaster walls of a gallery which Henri IV. had constructed and which was to unite the Louvre with the Tuileries. When he arrived in Paris from Rome he found that Lemercier, the architect, had arranged panelling to accommodate ninety-six views of French landscapes by Fouquières. Poussin was "premier peintre du roi," and as such had the first claim to the commission. His rights could not be denied. He prepared a plan for alterations in the gallery, and, as was to be expected, the landscapes by the Flemish artist had to succumb to the *Labours of Hercules*. That was interfering with Lemercier as well as with Fouquières.

The architect was not obliged to receive direction from a painter, however eminent. He held the appointment of "architecte du roi" from 1618, and in 1642 he had had the experience of a quarter of a century in the office. Painters and sculptors had worked under him. In 1624 he was entrusted with the continuation of Pierre Lescot's work at the Louvre, and was scrupulously loyal to his predecessor's plans. This was no easy task, for Richelieu insisted on having a royal palace which should contain at least four times the area of the buildings proposed by Lescot. Lemercier had also, prior to 1642, designed for the great cardinal the palace now known as the Palais-Royal. The college of the Sorbonne, which was demolished a few years ago, was one of his works, as well as the church, which fortunately still exists and in which Richelieu was buried. At a later time he designed the church of St. Roch. He was recognised as the greatest architect of his time. He also gained the reputation of being considerate towards the artists and workmen who co-operated with him. Although he carried out so many noble buildings, Lemercier was a poor man when he died, for his most valuable property was his library, which was sold for 10,000 crowns. Poussin, like painters in general, has found more champions among writers than the architect. But from the evidence which has survived there are no grounds to warrant the belief that Lemercier in any way exceeded his authority or was unfair towards the painter. There was mismanagement in giving a commission both to Fouquières and to Poussin, but the architect was not responsible for the blunder. When the circumstances of the time are considered and the number of officials who contrived to hold on to the Louvre, the wonder is that many more painters were not ordered to decorate the gallery.

The stand made by the French painters on behalf of Fouquières also suggests which side was in the right. He was a Fleming, and the class of work he produced was only rarely employed in wall decoration. Now Simon Vouet, who led the opposition to Poussin's alteration of the gallery, was the principal representative of native art in France. There was much of the old craftsman in him, and if a patron wanted a painting or a score of paintings in the Italian manner, he would promptly execute the order like any *imagier* in Paris. He had painted a portrait of the Grand Turk in Constantinople, and he worked so long in Rome that he was able to have himself entitled a prince, but he never aspired to rivalry with the great Italians. For all we know he may have considered, like Mr. Ruskin, that Poussin, in spite of the supposed classicism of his paintings, possessed peculiarities which were weaknesses "induced in a highly intellectual and inventive mind by being fed on medals, books and bassi-relievi instead of nature, and by want of any deep sensibility." It is allowable for an artist to exercise criticism on another artist's works and method. Men like Poussin, however, esteem themselves as exempted from whatever is applicable to ordinary men, and Simon Vouet's efforts to insure fair play were interpreted as envy of the lowest kind. What made the opposition appear more base to Poussin was its success. His patron M. des Noyers, the minister, suggested to the painter the wisdom of returning to Rome.

The long epistle which Poussin wrote to Des Noyers gives his version of the affair. He commences by expressing the desire that one could see what was passing in the minds of men, for it was very difficult otherwise to judge of the capacity of those who practised the sciences and arts. Annibal Carracci and Domenichino were made to suffer from envious rivals, and Poussin classed himself with them in their misfortunes. He then complains that Des Noyers, who should have been his protector and who gave him the occasion to be calumniated, should listen to the lies of enemies. Some were hopeful of gain, others hoped to obtain pictures by Poussin, all who condemned the works commenced in the gallery were ignorant or malicious. They failed to observe how he had avoided the defects and monstrosities which were found in the work of the "Mercier," and the disagreeable heaviness, coldness, melancholy dryness of the landscapes. Those on the ceiling suggested its collapse. The architect found himself controlled by the consoles, which were along the cornice, and which were not uniform in number on the two sides. The division of space was therefore irregular. It should be known there was a difference between aspect and prospect, the latter being an office of the reason and depending on the eye, the visual ray and the distance of the eye from the object. The prospect in the gallery was unsatisfactory. Poussin said if he had known the conditions of the place and were consulted he would not have recommended that the work should be undertaken. The men who could assist were few in number; it would necessarily occupy a long period and the cost would be excessive. After all the outlay the gallery would still be no more than a passage. In conclusion, Poussin maintained he had served the king by producing a series which was more agreeable and beautiful, better distributed, more varied and less expensive than the land-

Digitized by Google

scapes, but he was willing to cede his position to those who were more capable, but who were hitherto unknown. The old artists were not shy in relating their own merits, and Poussin was not an exception.

Poussin returned to Rome, and there remained until his death in 1675. Des Noyers having again accepted office wished to have the painter in Paris, but he declined. His experience was not favourable to the depending on the favour of courtiers. It is considered by some critics that his most successful works were produced after his abandonment of France. Poussin's reputation did not suffer by the gallery incident, nor were all architects inimical to him because he opposed Lemercier. Le Notre, among others, obtained orders for pictures by Poussin. Englishmen were also among his patrons. When Victor Cousin left his metaphysics for a short holiday in England he was amazed at the number of Poussin's works which he found. He had in lectures spoken of the *Seven Sacraments*, but he was pained to discover afterwards that France had only engravings of them of the kind he used, and to see the originals one must go to England. He therefore rebuked the French Government which allowed works to cross the channel which should have been retained at any cost as productions of the philosopher of painting, the Racine of Art, and which were collected with a religious care by Richelieu and Mazarin.

It is possible to explain the difference between Poussin and Lemercier on less sordid grounds than the apprehension of a loss by the painter. By the old system of the Renaissance the competence of painters, sculptors and goldsmiths to construct buildings was assumed. When we find a young man like Raphael entrusted with the great work at St. Peter's we can realise to what lengths credulity was carried. The architects were also supposed to be able to paint and carve, but somehow fewer opportunities were allowed to them. In France a different system came into operation. The office of the architect was defined. Yet it is easy to understand that a painter who had lived in Rome, and who was highly esteemed, like Poussin, would ignore the change, and would imagine that he was to have as free a hand in the gallery of the Louvre as was allowed to Michel Angelo in the Papal chapel. The affair was therefore as much a contest between two systems of decorating a building as between a painter and an architect.

The grand gallery was not worth a dispute. Henri IV., we believe, had it constructed as an aid to his own security, for he anticipated assassination, and was desirous to have a covered way along which he could fly in safety from one palace to another. It had a length of 1,332 French feet and a width of 36 feet. It was thus more than a quarter of a mile in length, and as there was no need for decoration the building was left for over thirty years with plain walls. When Lemercier was ordered to complete the gallery, he sought after a kind of decoration which would be adapted to large compartments. Landscapes boldly painted and divided by massive framing or borders did not seem to be out of place. Poussin was able to have a trial made of his figure pieces, but as well as can be made out he soon grew tired of the undertaking. Fouquières also was unable to complete his landscapes. The gallery was not much used, and afterwards a series of plans in relief of the fortified cities of France were placed in it. After some years the reliefs were removed. Louis XIV. did not care for the Louvre, and the roof of the grand gallery was in such a state that the series of big battlepieces representing the victories of Alexander the Great which had been deposited there suffered from the rain. At the beginning of the eighteenth century it was proposed to turn the gallery into a library. But it proved to be too narrow for the large bookcases and tables required for the examination of plans. When the Infanta of Spain came to Paris in 1752 the gallery was converted into quarters for her attendants. At a subsequent date it was again used for models of fortified places. Before the Revolution it was proposed to be utilised for a museum. Under Napoleon the project was carried out on a larger scale. The gallery was altered under the direction of Percier and Fontaine, and now it is difficult to realise its original appearance. Like most of the other parts of the old Louvre it has a history, some of the incidents of which we have endeavoured to relate.

THE TRADES UNIONS AND TRADE DISPUTES BILLS.

By W. S. Holdsworth, D.C.L.

THE report of the recent Commission on trade disputes, which we have discussed in *The Architect* (March 30, April 6), suggested various amendments in the law relating to trades unions and trade disputes. It was to be expected, therefore, that some new legislation upon the subject would be introduced. The Bill which was originally supported by the present Government substantially followed the recommendations of the majority of that Commission. It proposed to do for the law of conspiracy, regarded as a civil wrong, what was done for the law of conspiracy regarded as a criminal offence by the Conspiracy and Protection of Property Act, 1875, by enacting that an act, if done by a combination of two or more persons in furtherance of a trade dispute, should not be actionable, unless the act, if done by one person, would have amounted to a tort. It legalised peaceful picketing. It legalised acts which interfered with the trade, business or employment of another, or with a man's right to dispose of his labour or his capital as he pleased, if such acts were done in contemplation or furtherance of a trade dispute. It provided that trade union funds should not be liable for wrongful acts committed by the agents of the trade union, unless the act was committed by the committee of the union, or by some person acting under their authority; and it was provided that a person should not be deemed to have acted under the authority of the committee if the act was expressly prohibited by the committee or expressly repudiated by it as soon as such act was brought to its knowledge. This Bill, therefore, followed out the recommendations of the majority of the Commission in so far that it maintained the authority of the Taff Vale decision. As we have said, these recommendations, and therefore the Bill founded upon them, were too favourable to the trade unions, if regard is paid to the evidence offered to the Commission and to the principles recognised by the Commissioners as the basis of their recommendations.

But the Labour party were not satisfied even with these proposals. They held aloof from the Commission—conscious, perhaps, that their aims and desires would not bear the light of a judicial analysis; and it is common knowledge that the present Government have capitulated to their demands. The Bill supported by them, which presumably the Government will now apply its majority to carry, differs from the Bill originally proposed by the Government in the fact that it reverses the Taff Vale decision. One clause of the Bill provides that "an action shall not be brought against a trade union . . . for the recovery of damage sustained by any person or persons by reason of the action of a member or members of such trade union;" and this proposal is sanctioned by the Government in the face of the finding of the Commission, that if trade union funds were thus exempted from the law, trade unions would be the only associations exempt from liability for wrongs committed or authorised by them; and that if the existing law did not recognise such liability, it ought to be changed so that such liability should be recognised.

When proposals are made in a Bill which is sanctioned by the Government, opinions may differ as to their expediency; but it is generally possible to find

Digitized by Google

some reasonable grounds for bringing them forward, if the matter is looked at from the point of view of the proposer. We have tried from all points of view to find some reasonable grounds for the proposals made by this Bill to reverse the Taff Vale decision; but we have been unable to discover any motive other than the desire which is common to all, including the child and the savage, to be at liberty to have one's own way, regardless alike of expediency and justice. Those who make these proposals are loud in their protestations that they desire only equal justice for all, and that they wish for no preferential treatment; but while making these protestations they are engaged in bringing in a Bill which will place trade unions in a position of freedom from the law which no other individual or association enjoys. The only attempt we have seen to justify such proposals is the use of the supposed analogy between the organisation of the learned professions and the organisations of the workmen in their trade unions. The members of the learned professions, it is said, have a monopoly of the exercise of their particular profession --why should not the trade union have a monopoly of the labour market? The answer to this is that there is no analogy whatever between the objects of the organisation of the learned professions and the objects of the organisation of a trade union. The organisation of the learned professions is established with a view to protect the public by requiring from the candidate for membership some evidence of fitness, and by maintaining rules of professional honour which shall conduce to the honest exercise of the profession. The organisation of the trade union is established not with a view to benefiting the public by making the workman a competent workman, but with a view simply of getting for him as large a wage as the employer can pay. Their objects are to benefit their members, not to benefit the public. No one who thinks for a minute can fail to see the fallacy of such an analogy; and yet this analogy is constantly put forward by the trade unionists as a justification of their extreme demands.

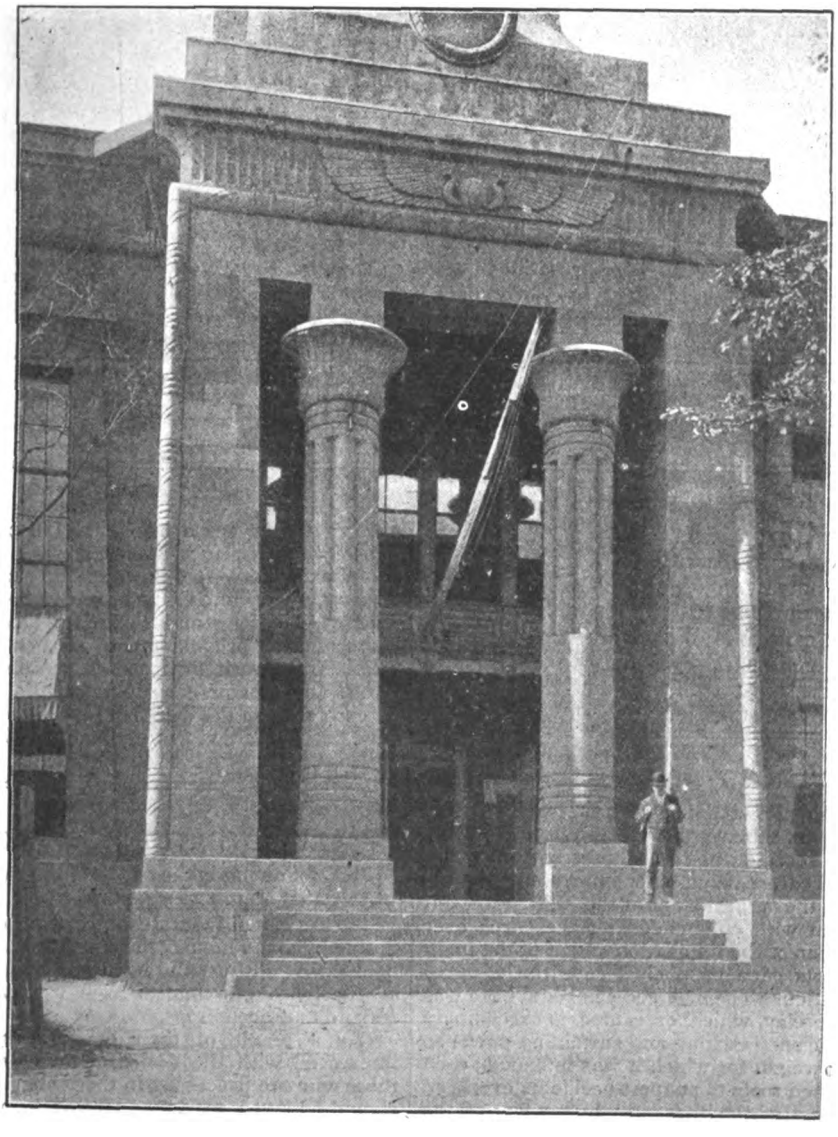
The very strength of the case against the proposals of this Bill causes a thinking person some embarrassment in dealing with it. He seems to himself to be constantly talking truisms. He has constantly to remind himself that arguments directed against paradoxes sanctioned by a responsible Government, truisms though they be, require to be stated. We said, in commenting on the proposals made by the Commission on trade disputes, that to exempt trade unions from liability for tortuous acts committed or authorised by them would be a serious handicap upon the industry of the country. It clearly tends to take from employers that control over their own business which is essential to the profitable carrying on of those businesses. If this clause becomes law, we do not doubt that we shall find that, whenever possible, employers will remove their businesses and carry them on in countries where such restrictions are unknown, and if this course is taken we may expect to see the problem of the unemployed assume far larger dimensions than it has ever assumed before. When this course is not possible we cannot but expect to see a period of industrial war. The trade unions decline to be bound by the law because they consider that it oppresses them. They therefore seek to emancipate themselves from it. Can we expect that employers of labour when deprived of legal redress will not in self-defence unite to protect themselves in any manner they are able? They will be extremely foolish if they do not unite with this object. The wide terms of these Bills legalise acts done by associations of employers if done in furtherance of a trade dispute, as well as acts done by associations of the employed.

The employers, if such a Bill is passed, cannot hope to get any assistance from the law. They must rely upon the freedom from the law which is given to them by these legislative innovations. The result will be that in the case of a trade dispute the law will, by the Act of the sovereign Legislature, lose much of its power to moderate such disputes. The parties, to borrow a phrase from international lawyers, will be like two sovereign states "in a state of nature" as regards one another. The consequences it will be easy to imagine. Strikes will be met by lock-outs. "Peaceful picketing" of the trade union will be met by "peaceful picketing" on the part of combinations of employers. In all probability the funds of the trade unions will be exhausted before the funds of the employers of labour. Acute distress, and all the evils which accompany acute distress, will accompany and follow this industrial war.

In the meantime the trade of the country may well be materially ruined. We cannot, indeed, expect that those whose aim is the immediate benefit of the labouring classes by the easy plan of yielding to their demands will take such remote consequences into consideration. They cannot be expected to foresee that the emancipation of trade unions from the law will unite the employers for the purpose of necessary self-defence. Nor do we press the point that our greatness as a nation may well depart with our trade. These are arguments which will, no doubt, be denounced as visionary by those whose mental horizon is limited by the desire to attain a greater measure of bodily comfort, not by the hard road of increasing their wage-earning capacity, but by the easy road of coercing their employers without fear of legal consequences. We should remember, however, that things which seem visionary to the short-sighted are seen clearly enough by those whose powers of sight are normal. Though we do not blame those who cannot see, we do blame those who see further and yet, to gain a passing advantage, give way to the demands of those whom they ought to guide. But we do press the point, which cannot be regarded as visionary except by the totally blind, that the proposals made by the Labour party may not have the results which that party expects. They hope that the labouring classes will be handed over tied and bound to the trade unions. They hope that their power to coerce the employer will be similarly increased. We may well doubt whether these hopes will be realised.

The effects of a change in the law directed to secure some one object cannot be strictly limited to the attainment of that object. The effects are felt all through the social and the industrial organisation of the State; and they may well call into existence wholly new conditions, different indeed from the old conditions before the change in the law was effected, but still more different from the conditions which the change in the law was expected to produce. As we have said, we do not think that the employers will tamely submit to the coercion which it is the object of this Bill to legalise. If this Bill passes they will find small help in the law, and they must, therefore, combine to protect themselves. It may well be that the successful resistance of the employers to the tyranny of the trade unions will mean a real charter of liberty for the working man.

At a time when schemes of international arbitration are in the air, a civilised community deliberately proposes to set aside the law, and to submit the large number of questions that arise in the course of the most important class of disputes of modern times—disputes between employers and employed—to the only alternative to the arbitrament of the law, the arbitrament of force. The very persons who shudder at the horrors of war do not shrink from weakening the control of the law courts over a class of disputes in which, by reason of the heated passions of the contesting parties, an impartial adjudication is peremptorily demanded. The desire to be universally benevolent by the easy mode of dispensing indiscriminate charity has before now led individuals into strange places. The same desire is now performing the same office for the party which is animated by it, and that party is master of the executive power in the State.



The Society of Ordained Surveyors at their annual meeting in Edinburgh elected Mr. John C. Hamilton as president.

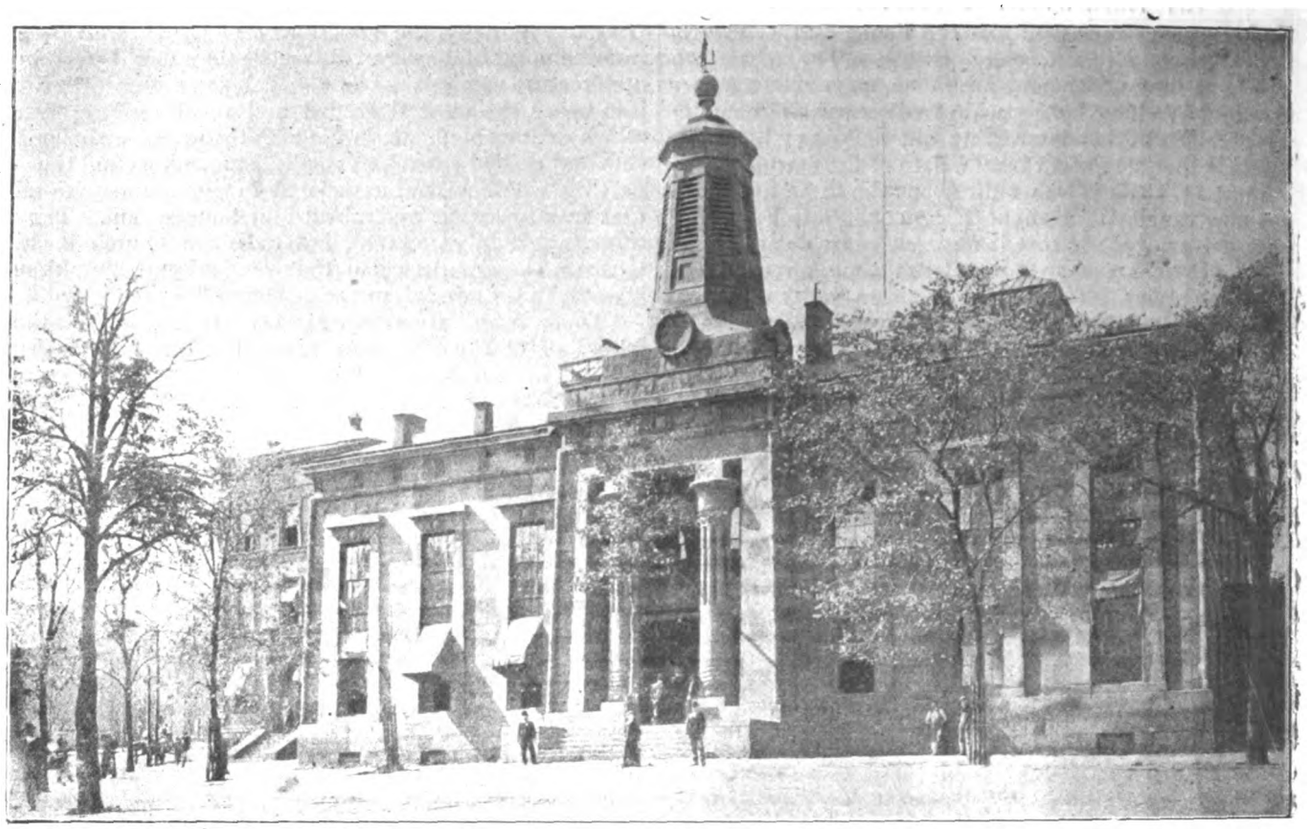
AN AMERICAN COURTHOUSE.



THE views represent the old Essex County Courthouse, Newark, New Jersey. The *American Architect*, from which they are taken, says of the structure :—"We have been unable to discover the name of the architect of this interesting old building; but, considering that, as shown by the date of the corner-stone, August 23, 1836, it was built about the same time with the now vanished 'Tombs' Prison, of New York, the external evidence is that it was probably designed by John Haviland, who about that time affected the Egyptian styles. The old building, in red sandstone, is about to be torn down so as to uncover the façade of the new white marble courthouse by Mr. Cass Gilbert, of which the pediment can be faintly seen rising above the roof of the old building." Although Greek and Roman examples found most favour in the United States, it could not be said that Egyptian architecture was entirely neglected. At the Mount Auburn Cemetery, near Boston, an Egyptian gateway was erected, and most of the monuments were pyramids and obelisks or tombs supported by heavy Egyptian columns. There seemed to be such a probability that the style would be adopted for sepulchral architecture, a writer in the *North American Review* in 1836 took the trouble of warning his countrymen against imitating the Mount Auburn cemetery. He said:—"It is very doubtful whether the Egyptian style is most appropriate to a Christian burial-place. It certainly has no connection with our religion. In its characteristics it is anterior to civilisation, and therefore it is not beautiful in itself. No one will deny the superiority of the Grecian style in mere point of beauty. But more than this, Egyptian architecture reminds us of the religion which called it into being, the most degraded and revolting Paganism which ever existed. It is the architecture of embalmed cats and deified crocodiles : solid, stupendous and time-defying, we allow, but associated in our minds with all that is disgusting and absurd in superstition. Now there is certainly no place, not even the church itself, where it is more desirable that our religion should be present to the mind than the cemetery."

There was, we suppose, less objection to the adoption of the Egyptian style for the New York prison known as "The Tombs," which Charles Dickens described as a "dismal-fronted pile of bastard Egyptian, like an enchanter's palace in a melodrama." But that prison, which was supposed to be a great experiment in the treatment of criminals, has been superseded by a building which exemplifies modern construction. When we consider that the Egyptian style was used in the way we have mentioned, it was allowable for Americans some seventy years ago to assume that it had a special adaptation for courthouses. Although the Essex Courthouse is more impressive than the many which were erected about the same time in England, we believe no other experiments were tried. Yet amidst the chaos which then existed Egyptian models might have served as a restraining power. As the writer already quoted said :—"There may be no

THE OLD ESSEX COUNTY COURTHOUSE, NEWARK, N.J.

American literature, painting, sculpture, but there certainly is American architecture. We have columns which mock at the narrow limits of the Grecian orders; domes whose proportions are more stupendous, if not more vast, than the marvel of ANGELO; ornaments which it would baffle the genius of PALLADIO to class; and 'shingle palaces' that rival pandemonium itself."

CULROSS ABBEY.

WHEREVER the pick and shovel are at work in and around Culross Abbey prehistoric discoveries are being made. To the south of the recently discovered crypts the tops of other arches are being revealed, which supports the theory that, with the natural slope of the hill, the ancient monastery had risen with colonnaded terraces arch over arch. An examination of the foundation of one of the main columns of the crypts gave us a clue, says the *Glasgow Herald*, to its demolition. The moulded octagonal base was simply set upon the clay, which, of course, is exceedingly hard, but not of sufficient resisting and sustaining power to carry the enormous weight for which it was intended; each column had two arched roofs to support beside its overhead column. That is one of the reasons why so few of the original column-supported arches are in existence in monastic buildings.

To the south of the new vestry, close to the south transept, where portions of two finely moulded projecting jambs spring from a dainty, towering, pyramidical base, were found two stone coffins. An inside garden wall had been taken down, and an old walk between that and the transept lowered to a depth of 4 feet for the purpose of conforming and incorporating it into the old garth or garden, and upon further excavating for a foundation of a new wall there a large stone coffin was found 2 feet below the new surface.

The head end of this coffin had been broken off, probably when the aforesaid wall was built. The stone was without a cover, and contained some remains. At its side and deeper in the ground a kistvaen of the earliest period was also found. A kistvaen is composed of natural flagstone set edgewise on the sides and ends, and covered over with one or more of the same. From the ninth century to the reign of Henry III. people of the higher classes were buried in stone coffins.

In excavating for the heating chamber in the south transept a very fine Celtic cross has been discovered. It is about 5 feet long and 14 inches broad on the face. Its characteristic ornamentation consists of interlaced and incised ropework arranged in regular fashion, reversing scrolls and ornamental panels on the centre of the shaft. At each side on the face there is a faint trace of what may have been a Celtic form of hieroglyphics.

REGISTRATION OF ARCHITECTS.

THE following is the report of the registration committee, dated March 20:—

To the Royal Institute of British Architects,—The committee have the honour to report that a sub-committee have held fifteen sittings and have heard the evidence and views of twenty-four architects from various parts of England, Ireland and Scotland,

As a result of their deliberations, the committee is impressed with the desire of many architects (especially those who are practising in the provinces) that a legal status should be given to duly qualified practitioners in architecture, and they are of opinion that this can be met by applying to Parliament for a legal diploma of membership of the Royal Institute of British Architects, it being made compulsory that after (say) 1912 all architects, before receiving this diploma, must have passed through a definite course of architectural education in a recognised school.

The committee believe that in a short time, if this were done, the holding of such a diploma would prove to be of professional value to all practising architects.

It is generally admitted by the advocates of the present draft Bill that the only chance of getting Parliamentary powers to carry out such a penalising proposal as the registration of the title of architect would be:—(1) By placing the registration in the hands of a board partly composed of members outside the Institute, though it is suggested that the Institute should be largely represented upon it; and (2) by exempting from its operations all the members of the Institutions of Surveyors and Civil Engineers. It is also

Digitized by Google

generally admitted that the standard for admission to such registration would have to be a low one.

The committee believe that unless the profession can approach Parliament with approximate unanimity there is little chance, in the present state of public business in the House of Commons, of getting any contentious measure passed.

The committee therefore recommend that at present the Institute should confine itself to attempting to obtain Parliamentary recognition for its membership, an attempt which they believe would meet with very general support. Such State recognition would encourage education and raise the qualifications of architects, and would at the same time avoid the temporary necessity of granting a statutory title to unqualified men.

The committee recommend that the title of the Institute be changed to that of the Royal College of Architects, and that a temporary third class of professional members be established.

As an appendix to this report the committee submit an outline of suggestions to give effect to the recommendations herein contained.

The committee beg leave to state that this report has been adopted by them unanimously at a meeting on March 20, 1906, at which the following members were present:—

Edwin T. Hall (vice-president), in the chair, R. S. Balfour, W. H. Atkin Berry, A. W. Brewill (Nottingham), J. J. Burnet (Glasgow), J. T. Cackett (Newcastle), W. D. Caröe, T. E. Collcutt, A. W. S. Cross, E. Guy Dawber, E. M. Gibbs (Sheffield), J. S. Gibson, W. J. Gilliland (Belfast), Alexander Graham (hon. secretary), E. A. Gruning, G. H. Oatley (Bristol), George Hubbard, H. V. Lanchester, A. N. Prentice, G. H. Fellowes-Prynne, John W. Simpson, John Slater, Leonard Stokes (vice-president), C. Harrison Townsend, Paul Waterhouse, Sir Aston Webb, Edmund Woodthorpe.

The President, whose absence through illness was deeply regretted, together with Mr. H. T. Hare, vice-president, and Mr. J. A. Gotch, who were unavoidably prevented from attending, have desired their names to be added to those appearing.

By order of the registration committee.

W. J. Locke, Secretary.

Appendix to the Report.

Heads of Scheme for Raising Qualification of Architects.

1. Revise the Charter, and
2. Submit a Bill to Parliament.

Charter Revision.

(*a*) Change name to Royal College of Architects, and the affixes F.R.I.B.A. and A.R.I.B.A. to F.R.C.A. and A.R.C.A.

(*b*) Substantive provision—In future Fellows to be elected (1) after 1906 from those who have passed the Associates' examination, or (2) by Council in special cases.

(*c*) To authorise the constitution of a scheme of education to be compulsory on all candidates coming up for examination after 1912.

(*d*) Create new subscribing class of temporary duration, without the power of voting, to be called Licentiates (L.R.C.A.), at a low fee, to admit bona-fide architects who are not eligible for F. or A.R.C.A. All members of allied or other societies of architects found eligible by the Council of the Royal College of Architects to be admitted as Licentiates without election. Admission to class to be closed within a year after the passing of the Act. All to sign declaration and obligation as to professional conduct.

(*e*) F., A. and L. to be defined as professional members.

(*f*) Disciplinary powers to be increased with power of appeal.

Bill to Parliament.

Declare it is in public interest that employers should be enabled to distinguish between architects recognised as qualified by a competent authority and those not so recognised.

Enact:—

(*a*) Following the precedent of the Law Society, the Royal College of Architects (already recognised by Parliament as authority for granting certificates required by district surveyors before they can receive appointments) be empowered and required by its Council to institute and supervise education and examination of architects for admission to the Royal College of Architects and to confer the titles F.R.C.A. and A.R.C.A. Confirming all such present titles.

(*b*) Give statutory force to present Charters.

(*c*) Legalise scale of charges, to be approved by Privy council, for all professional members of the Royal College of Architects.

(*d*) Municipalities and other public bodies acting in fiduciary position shall on the erection or alteration of buildings in cities or towns employ a professional member of the Royal College of Architects.

(N.B.—It is a question if clause (*d*) should be introduced, but it is likely to commend itself to Parliament, and it follows a policy long supported by the Council and by a large number of the members of the Institute. At the worst it could be struck out of the Bill.)

Memorandum to the Report of the Registration Committee.

In accordance with a resolution of the registration committee the President appointed in October last a sub-committee, consisting of the following:—Sir William Emerson, Sir Aston Webb, Messrs. J. Slater and T. E. Collcutt on the one side, and Messrs. J. S. Gibson, A. W. S. Cross, W. H. Seth-Smith and George Hubbard on the other side, with the President as chairman. Subsequently owing to Sir Wm. Emerson's absence in India Mr. E. T. Hall was nominated by the President to take his place, and the President's selection was subsequently confirmed by the registration committee.

At the first meeting of the sub-committee on October 25, 1905, the following procedure was agreed upon, viz. to summon twenty-four witnesses, comprising six metropolitan and six provincial architects in favour of registration, and a similar number of metropolitan and provincial architects holding the opposite view, the witnesses to be summoned to give their personal opinion on the question.

The first meeting for the examination of witnesses was held on November 22, and eleven subsequent meetings were held, when the following twenty-four gentlemen were good enough to attend and express their opinions before the committee. Those in favour were:—Messrs. W. Gillbee Scott, H. A. Saul, Lewis Solomon, Ellis Marsland (hon. secretary, Society of Architects), H. W. Wills, F. R. Farrow, H. L. Goddard (Leicester), S. Perkins Pick (Leicester), H. Smith (Bristol), W. J. Gilliland (Belfast), J. W. Beaumont (Manchester), John Keppie (Glasgow); and against them Messrs. J. Macvicar Anderson, Professor Beresford Pite, Reginald Blomfield, A.R.A., Basil Champneys, H. H. Statham, T. G. Jackson, R.A., C. Hadfield (Sheffield), Professor Capper (Manchester), J. J. Burnet (Glasgow), J. A. Gotch (Kettering), W. M. Fawcett (Cambridge) and Professor C. H. Reilly (Liverpool).

A shorthand writer was present throughout the proceedings to place the evidence on record.

The sub-committee then proceeded to consider its report to the registration committee. The general effect of the evidence may be briefly summed up as follows:—On the one hand, it was strongly felt by the witnesses in favour of registration that the standard of architectural ability would be raised by instituting compulsory training and examination; and also it was thought that in the interest alike of the public and the profession only those who had proved their competence by passing a qualifying examination should be legally entitled to call themselves architects.

On the other side there was an equally strong feeling that the measure proposed would have a tendency to lower the art of architecture, and that, as the test to be applied must in the opinion of many be a low one, there would inevitably be a tendency to register very poorly qualified men; and that, though examinations might fairly test a man's constructive knowledge, they could not fix a standard in art.

It seemed obvious that with these strongly conflicting views there would be the greatest possible difficulty in obtaining Parliamentary sanction to the measure proposed; and the sub-committee, after due deliberation, therefore unanimously agreed to the terms of a report, which was subsequently submitted to and approved at a well-attended meeting of the full registration committee held on the 20th ult. It was considered that, amongst the incidental advantages to be obtained by these proposals, and in addition to those mentioned in the sub-committee's report (*a*) it would insure legal recognition of the Institute's scale of charges; (*b*) it would enable the Institute to deal more effectually with cases of dishonourable professional practice; (*c*) and it would be likely to meet with the fairly unanimous support of the whole body of the Institute.

NOTES AND COMMENTS.

THE works committee of the London County Council have pointed out various reductions which may be made in the plans for three schools which the education committee propose to have erected. In one school, viz. Lawn Lane, Kennington, the reductions amount to no less than 1,875*l.*, and it may be interesting to have it stated in what they consist. They are in the report described as follows:—(1) Fittings to teachers and children's w.c.'s to be of a less costly nature; (2) board flooring rebated and secret nailed to the concrete to be substituted for wood-block flooring; (3) blue lias mortar to be used for brickwork and concrete except in the case of isolated piers, chimney-stacks and work below ground, and also in cases where the nature of the sites require foundations to be built in cement; (4) stocks to be specified as "good best" stocks and not as "picked"; (5) stone carving to be reduced and granolithic to be used for cills and copings (general architectural features) instead of stone; (6) drains underneath school buildings (if any) to be in iron, all other pipes outside building to be in stoneware; (7) yellow deal for framing and white deal for panels of cupboards instead of pine, and also less expensive wood throughout the school, with the exception of the roof timbers; (8) railings of a cheaper design; (9) cheapening cost of playsheds and the substitution of iron columns for brick piers where possible; (10) plaster to be specified as "render" and "set" instead of "render, float and set;" plaster cornice to be omitted, and wood frieze moulding without cornice to be specified instead; (11) providing salt-glazed double-stretchers instead of partitions between water-closets; (12) omit N.A.P. fittings to windows and substitute running gear for window gearing; (13) eighth-inch galvanised iron cisterns in lieu of ALEXANDER'S pattern; (14) screws only to glazing beads in lieu of cups and screws. Similar modifications in each of two schools in Wandsworth will effect the substantial reduction of 1,390*l.* In other words, the suggestions will save 4,655*l.* The works committee are not renowned for economy, but, after this demonstration, what is to be thought of the system hitherto adopted by the education committee?

IN "King John" SHAKESPEARE suggests that the monarch died without knowing that he had lost his troops in an unexpected flood of the Lincoln Wash. According to MATTHEW PARIS and some documents in the Rolls, JOHN had passed over the Wash from the Cross Keys to Fossdike, but on looking back "beheld a long train of waggons and sumpter-horses, which carried his jewels, insignia and money, swallowed up in a whirlpool, caused by an influx of the tide and the current of the Welland." At a time when so much interest is taken in buried treasures it would be strange if those in the Wash were overlooked. Mr. ST. JOHN HOPE has taken up the subject, and with his usual energy has been making various investigations. He has had the tides worked out back to the thirteenth century, and with the help of other data he has come to the conclusion that the scene of the disaster was at Sutton Bridge, between Cross Keys and Holbeach. The Welland stream has in the course of time become more narrowed, and he believes that the baggage carts have sunk to a lower strata. The Midland Railway Company have made borings about the spot, but have not come into contact with any treasures. At present there is silt for a depth of 23 feet, and in it Mr. ST. JOHN HOPE believes King JOHN'S treasures are entombed. The probability of finding it is greater than in other ventures that have tempted capitalists.

THE Dundee Town Council having directed Mr. MACKISON, the burgh engineer, to perform work of the kind generally known as Parliamentary, he declined to do so on the ground that it was outside his ordinary duties. It is true Mr. MACKISON for several years performed similar duties. But he claimed extra payment for them, and the subject will no doubt be investigated in the Law Courts as an action for fees. In dealing with so important a matter comment is not called for, as we may suppose the claim is now a subject of litigation. But it may be recorded that by a majority of one vote the Council has suspended Mr. MACKISON for four months. It is supposed that the Council were entitled to ask the burgh engineer to perform certain work, and by declining it he rendered himself liable to dismissal or suspension. It is not likely Mr. MACKISON at the end of the term will return to his duties in a contrite disposition. And for the ratepayers there will be the expense of paying an official during four months without receiving any return. If he had carried out the Parliamentary work it would be argued that he was only doing what he had done during forty years; or, in other words, had acted as a Parliamentary expert without any expectation of reward. The case is therefore complicated, and it would be more economical if it were tried by a tribunal of a few experts in engineering practice than by their Lordships of the Court of Session.

IN the last session of Parliament a Bill was introduced by the Government which would allow of the creation of a new School of Art in Edinburgh. The Scottish Education Department have been inquiring of the Town Council about the expediency of establishing a municipal School of Art in Edinburgh, that would include responsibility for erection and maintenance. The Department would, however, make a substantial grant towards the initial cost of building and equipment. The annual maintenance would be partly covered by fees, but the Treasury would be willing to grant half the deficiency provided the other half were obtained from local authorities or otherwise. A committee of the Town Council has considered the subject.
